§. As a general rule, the feminine is derived from the masculine, rather than the masculine from the feminine. The words *widow-er*, however, from *widow*, and *wizard* from *witch*, are exceptions.

83. The Plural of Substantives is formed from the Singular by adding *s*—as *pit*, *pit-s*; *stack*, *stack-s*.

84. When, however, the Singular ends in *s* or *sh*, *e* is inserted—*loss*, *loss-es*; *blush*, *blush-es*.

85. When the Singular ends in *o*, the Plural ends in *oes*; as *cargo*, *cargoes*.

86. When the Singular ends in *y*, preceded by a consonant, the Plural ends in *-ies*; as *lady*, *ladies*; *quantity*, *quantities*.

87. In *youth*, *oath*, *truth*, and *path*, the *th*, though

sounded in the Singular as in *thin*, is sounded in the Plural as in *thine*.

Singular.		*Plural.*
You*th*	pronounced	You*dhz*, not You*thce*.
Tru*th*	„	Tru*dhz* „ Tru*thce*.
Pa*th*	„	Pa*dhz* „ Pa*thce*.

88. In *house*, the *s*, though sounded in the Singular as in *sin*, is sounded in the Plural as *z*. *Houses* is pronounced *houzez*.

89. The following words, though the Singular ends in *f*, form the Plural in *v*.

Loaf	Loa*ves*.	Wife	Wi*ves*.
Half	Hal*ves*.	Knife	Kni*ves*.
Life	Li*ves*.	Shelf	Shel*ves*, &c.

90. The Plural of *woman* is pronounced *wimmen*.

91. *Six pennies* means *six separate penny-pieces*. *Sixpence* means *a single coin equal to six separate pennies*. The idea, in this case, is both plural and singular. It is plural if we consider the several separate coins. It is singular if we consider the sum to which they amount. Words of this kind are called *Collectives*. The true Plural of the word *penny* is *pennies;* whereas *pence* is a Collective form.

92. The *ce* in *pence* is sounded as *-s*, but the *s* in *pens* the plural of *pen* as *z* = *penz*.

93. The *dies* with which we coin are Plural; the *dice* with which we play are Collective. The Singular form is, in both cases, *die*.

94. *Kine*, *swine*, and *brethren*, are Collective rather than Plural.

95. The following Collectives change the vowel of the Singular.

Mouse	*Mice.*		*Goose*	*Geese.*
Louse	*Lice.*		*Tooth*	*Teeth.*
			Man	*Men.*

96. In *alms* and *riches*, the *s* belongs to the original word; which, in respect to its form, is no Plural, but a Singular.

Alms comes from the Anglo-Saxon *ælmesse.*
Riches ,, French *richesse.*

WORDS OF FOREIGN ORIGIN.

§. Words introduced into the English from the French language.

Sing.	*Plur.*	*Sing.*	*Plur.*
Beau	Beau*x.*	Billet-doux	Billets-dou*x.*
Chamois	Chamoi*s.*		

§. Words introduced into the English from the Latin language.

First Class.

Words wherein the Latin Plural is the same as the Latin Singular.

	Sing.	*Plur.*	*Sing.*	*Plur.*
(*a*)	Apparatus	Apparatu*s.*	Impetus	Impetu*s.*
	Hiatus	Hiatu*s.*		
(*b*)	*Sing.*	*Plur.*	*Sing.*	*Plur.*
	Congeries	Congerie*s.*	Species	Specie*s.*
	Series	Serie*s.*	Superficies	Superficie*s.*

Second Class.

Words wherein the Latin Plural is formed from the Latin Singular by changing the last syllable.

(*a.*)—Where the Singular termination *-a* is changed, in the Plural, into *-æ.*

Sing.	*Plur.*	*Sing.*	*Plur.*
Formul*a*	Formul*æ.*	Nebul*a*	Nebul*æ.*
Lamin*a*	Lamin*æ.*	Scori*a*	Scori*æ.*
Larv*a*	Larv*æ.*		

(*b.*)—Where the Singular termination *-us* is changed, in the Plural, into *-i.*

Sing.	*Plur.*	*Sing.*	*Plur.*
Calcul*us*	Calculi.	Polyp*us*	Polypi.
Colossu*s*	Colossi.	Radi*us*	Radii.
Convolvulu*s*	Convolvuli.	Ranunculu*s*	Ranunculi.
Foc*us*	Foci.	Sarcophagu*s*	Sarcophagi.
Geni*us*	Genii.	Schirrhu*s*	Schirrhi.
Magu*s*	Magi.	Stimulu*s*	Stimuli.
Nautilu*s*	Nautili.	Tumulu*s*	Tumuli.
Œsophagu*s*	Œsophagi.		

(*c.*)—Where the Singular termination *-um* is changed, in the Plural, into *-a.*

Sing.	*Plur.*	*Sing.*	*Plur.*
Animalcul*um*	Animalcul*a.*	Mausole*um*	Mausole*a.*
Arcan*um*	Arcan*a.*	Medi*um*	Medi*a.*
Collyri*um*	Collyri*a.*	Memorand*um*	Memorand*a.*
Dat*um*	Dat*a.*	Menstru*um*	Menstru*a.*
Desiderat*um*	Desiderat*a.*	Moment*um*	Moment*a.*
Effluvi*um*	Effluvi*a.*	Premi*um*	Premi*a.*
Emori*um*	Emori*a.*	Scholi*um*	Scholi*a.*
Encomi*um*	Encomi*a.*	Spectr*um*	Spectr*a.*
Errat*um*	Errat*a.*	Specul*um*	Specul*a.*
Gymnasi*um*	Gymnasi*a.*	Strat*um*	Strat*a.*
Lixivi*um*	Lixivi*a.*	Succedane*um*	Succedane*a.*
Lustr*um*	Lustr*a.*		

(*d.*)—Where the Singular termination *-is* is changed, in the Plural, into *-es.*

Sing.	*Plur.*	*Sing.*	*Plur.*
Amanuens*is*	Amanuens*es.*	Ellips*is*	Ellips*es.*
Analys*is*	Analys*es.*	Emphas*is*	Emphas*es.*
Antithes*is*	Antithes*es.*	Hypothes*is*	Hypothes*es.*
Ax*is*	Ax*es.*	Oas*is*	Oas*es.*
Bas*is*	Bas*es.*	Parenthes*is*	Parenthes*es.*
Cris*is*	Cris*es.*	Synthes*is*	Synthes*es.*
Diæres*is*	Diæres*es.*	Thes*is*	Thes*es.*

Third Class.

Words wherein the Plural is formed by inserting *-e* between the two last sounds of the Singular, so that the former number always contains a syllable more than the latter.

Sing.			*Plur.*	*Sing.*			*Plur.*
Apex	*sounded*	Apec-*s*	Apic*es.*	Index	*sounded*	Indec-*s*	Indic*es.*
Appendix	—	Appendic-*s*	Appendic*es.*	Radix	—	Radic-*s*	Radic*es.*
Calix	—	Calic-*s*	Calic*es.*	Vertex	—	Vertec-*s*	Vertic*es.*
Cicatrix	—	Cicatric-*s*	Cicatric*es.*	Vortex	—	Vortec-*s*	Vortic*es.*
Helix	—	Helic-*s*	Helic*es.*				

In all these words the *c* of the Singular number is sounded as *k*, of the Plural as *s.*

Words introduced into English from the Greek language, and retaining the Greek plural forms.

First Class.

Words where the Singular termination *-on* is changed, in the Plural, into *-a.*

Sing.	*Plur.*	*Sing.*	*Plur.*
Aphel*ion*	Aphel*a.*	Criter*ion*	Criter*a.*
Perihel*ion*	Perihel*a.*	Ephemer*on*	Ephemer*a.*
Automat*on*	Automat*a.*	Phænomen*on*	Phænomen*a.*

Second Class.

Words where the Plural is formed from the original root by

adding either *-es* or *-a*, but where the Singular rejects the last letter of the original root.

Plurals in -es :—

Orig. root.	*Plur.*	*Sing.*	*Orig. root.*	*Plur.*	*Sing.*
Apsid-	Apsid*es*	Apsis.	Ephemerid-	Ephemerid*es*	Ephemeris.
Cantharid-	Cantharid*es*	Cantharis.	Tripod-	Tripod*es*	Tripos.
Chrysalid-	Chrysalid*es*	Chrysalis.			

Plurals in -a :—

Orig. root.	*Plur.*	*Sing.*	*Orig. root.*	*Plur.*	*Sing.*
Dogmat-	Dogmat*a*	Dogma.	Miasmat-	Miasmat*a*	Miasma.
Lemmat-	Lemmat*a*	Lemma.			

97. The Possessive Case *Singular* of Substantives is formed by adding *s*, with an apostrophe *before* it. *The father's children* means *the children of* a single *father.*

98. The Possessive Case *Plural* is formed by adding *s* with an apostrophe *after* it. *The ships' sails* are *the sails of* several *ships.*

§. In the present state of our language, the Possessive Case Singular is the same as the Nominative Case Plural ; the difference between them being imperceptible to the ear, and notified to the eye only by the use of the apostrophe. The identity, however, is only apparent. In Anglo-Saxon, the *Nominative* Plural ended in *as*, while the *Possessive* ending was *es*. The Nominative Plural of *dæg* (*day*) was *dægas*, while the Possessive Singular was *dæges*. In course of time the vowel was omitted, and, now, although we write *days* for the Nominative, and *day's* for the Possessive, both words are sounded alike.

ADJECTIVES.

99. A word capable, by itself, of forming the Predicate, but incapable of forming the Subject, of a proposition, is called an Adjective.

100. An Adjective shows that the Substantive with which it is united possesses a certain quality. To say that *glass is smooth, clear, brittle and bright*, is to say that it possesses the qualities of *smoothness, clearness, brittleness and brightness.*

101. Qualities may be possessed in different degrees. One piece of glass may be as *bright* as

another, a second may be *brighter*, and a third the *brightest* of all. Adjectives, therefore, though they have neither Gender nor Number, nor yet Case, have three Degrees of Comparison, viz.:

1. The *Positive:* which gives the word in its simple form; as *bright:*
2. The *Comparative:* formed from the Positive by the addition of *-er;* as *bright-er:*
3. The *Superlative:* formed from the Positive by the addition of *-est;* as *bright-est.*

102. The Superlative may also be formed from the Comparative by changing *r* into *s* and adding *t*, as dark-*er*, dark-*es*, dark-*es-t*.

§. This second mode of forming the Superlative appears, at first sight, to be both complex and superfluous. The following facts, however, will show that it is neither. Although it is quite true that, by adding *-est* to the Positive, a Superlative can be formed, it is by no means certain that such is the process by which it actually *was* formed.

In the oldest language of the class to which the English belongs, the Comparatives themselves ended in *z*; so that *ald-iza*, *bat-iza*, *sut-iza*, &c., are the original forms of what was afterwards *alt-iro*, *bets-iro*, and *suats-iro*, and what is now *old-er*, *bett-er*, and *sweet-er*. Considering the affinity between the sounds of *z* and *s*, it is not too much to say that the Comparative degree originally ended in *-s*.

Again,—whilst many languages have a Comparative degree without a Superlative, there is no such thing as a Superlative without a Comparative. Putting these facts together, it has been held, that, in the languages akin to the English, the Superlative is formed, not *directly* from the Positive, but *indirectly* from the Comparative—and that at a time when the latter ended in *-z*, or *-s*.

103. When the Positive ends in a short vowel, followed by a single consonant, the consonant is doubled; as *red*, *redder*, *reddest; thin*, *thinner*, *thinnest*.

104. When the Positive ends in *-y*, the Comparative and Superlative end in *i-er*, and *i-est;* as *holy*, *holi-er*, *holi-est*.

105. When the Positive ends in *-ng*, the *g*, though

not heard in the simple word, is distinctly sounded in the Comparative and Superlative. We say *long*, *long-ger*, *long-gest;* not *long*, *long-er*, *long-est*.

106. *Good* and *bad* have neither comparative nor superlative, *worse* and *better* no positive, forms.

§. A little consideration shows the nature of the foregoing rule. The Comparatives and Superlatives of *good* and *bad*, if they existed at all, would be *gooder* and *goodest*, *badder* and *baddest*. Yet it is well known that no such words occur in the language. It is also well known that there is no such word as *bet*, of which *better* could be the Comparative.

Worse has not even the ordinary ending in *-er*.

As far, however, as *meaning* is concerned, *better* is the Comparative of *good*, and *worse* of *bad*. The *words*, however, are different, and as neither is derived from the other, nor yet from any common source, there is no etymological connection between them. Such connection as there is, is logical.

The words under notice (and there are others like them) are each defective, though defective in a different manner. What one wants the other supplies.

107. In Anglo-Saxon the following words, along with some others, changed their vowels in the Comparative and Superlative degrees:—

Lang (*Long*).	Lengre (*Longer*).
Strang (*Strong*).	Strengre (*Stronger*).
Geong (*Young*).	Gyngre (*Younger*).
Sceort (*Short*).	Scyrtre (*Shorter*).
Heah (*High*).	Hyrre (*Higher*).

In the present English the words *elder* and *eldest*, from *old*, do the same.

108. *Late* has two Comparatives, *latter* and *later;* also two Superlatives, *latest* and *last*.

109. *More*, from the obsolete Positive *moe*, would more correctly be written *mo-er*.

110. *Nether* is from an obsolete Positive, viz. *nith* = *low*.

111. The true form of the word *near* is *neah*. The

h, however, has been changed into *-r*, upon the principle which leads some persons to say *idear* instead of *idea*. Hence *near-er* is an exceptionable form. The Anglo-Saxon was *nyrre*.

112. *Next* is the Superlative of *nigh*; being a contraction for *nighest*.

113. *Farther* is from *far=distant*; whilst *further* is from *fore=in front*. *Former* is also from *fore*. *First* is from the same root.

114. *Worse* and *worst* are words of which the origin is doubtful.

115. The words *inmost*, *outmost*, *upmost*, *midmost*, *foremost*, *hindmost*, *utmost*, are *doubly* superlative.

116. The words *nethermost*, *uppermost*, *uttermost*, *undermost*, *outermost*, and *innermost*, are not only *doubly* superlative, but comparative as well.

§. These last two statements require explanation. The common statement concerning words like *utmost* is, that they are compounds, formed by the addition of the word *most*. This, however, is more than doubtful; inasmuch as the Anglo-Saxon language presents us with the following forms:—

Innema (inn-ema)	Inmost.	Forma (for-ma)	Foremost.
Utema (ût-ema)	Outmost.	Æftema (aft-ema)	Aftermost.
Sithema (sith-ema)	Latest.	Ufema (uf-ema)	Upmost.
Lætema (læt-ema)	Latest.	Hindema (hind-ema)	Hindmost.
Nithema (nith-ema)	Nethermost.	Midema (mid-ema)	Midmost.

Besides these there are, in the other allied languages, words like *fruma = first*, *aftuma = last*, *miduma = middle*; in all of which the *m* that appears in the last syllable of each has nothing to do with the word *most*.

Upon this basis, however, was formed, in Anglo-Saxon, a regular superlative in the usual manner; viz. by the addition of *-st*; as *æfte-m-est*, *fyr-m-est*, *læte-m-est*, *siδ-m-est*, *yfe-m-est*, *ute-m-est*.

Hence, in the present English, the different parts of words like *upmost* come from different quarters. The *m* is the *m* in the Anglo-Saxon words *innema*, &c.; whilst the *-st* is the *st* in *brightest*, &c. In separating, then, such words as *midmost* into its component parts, we should write—

Ut-m-ost	*not*	Ut-most.	In-m-ost	*not*	In-most.
Up-m-ost	—	Up-most.	Hind-m-ost	—	Hind-most.
Fore-m-ost	—	Fore-most.	Out-m-ost	—	Out-most.

§. In *nethermost*, &c. the syllable *m-ost* is added to a word already ending in *er*; that is, to a word already marked with the sign of the comparative degree.

§. *Former* (*for-m-er*) is a comparative from the Anglo-Saxon superlative *forma* (*for-m-a*).

117. Certain words ending in *-th* and *-ness* are called Abstract Substantives or Abstracts; as *length*, *happiness*.

118. Abstract Substantives have their corresponding Adjectives. *Length* is formed from *long*; *happiness* from *happy*. They denote a quality; of which quality they are the names.

119. Adjectives are no true names at all; but words which suggest a name. They become true names when converted into Abstract Substantives.

VERBALS.

120. Certain words, like *hunter* and *cleansing*, are called Verbal Substantives or Verbals.

121. Every Verbal has its corresponding Verb. *Hunter* is formed from *hunt* by the addition of *-er*; *cleansing* from *cleanse* by the addition of *-ing*.

§. In form these Verbals are for the most part identical with the Participle; and there is no want of writers who treat them as such. *Hunting*, for instance, is made the Participle of *hunt*; *rising*, of *rise*. That the resemblance, however, is accidental, and that the two forms have no original connection, becomes clear upon a little consideration.

In the first place there are such plural forms as *the risings of the north*; *the huntings of the hare*; *the watchings and wakings of an anxious man*.

Secondly, the Anglo-Saxon form of the Substantive was not *-ing*, but *-ung*; whilst that of the Participle was *-nd*. The Participle of *clœnsian* = *to cleanse*, was *clœnsiand*; the equivalent to the word *cleansing* was *clœnsung*.

122. The Verbals in *-ing* denote actions and results. *Hunting* is the act performed by a *hunter*; *sleeping* the deed done by one who *sleeps*.

123. Instead of the Verbal we may use the Verb

preceded by *to—Rising early is good for the health*; or, *To rise early is good for the health.*

124. The Verbals in *-er* denote agents; a *hunter* being one who *hunts*; a *sleeper* one who *sleeps*.

125. The Verbals in *-er* are true English words; and they must be distinguished from those in *-or*, which are derived from the Latin. Words like *baker*, *singer*, *fisher*, &c., are English, words like *actor* are Latin.

§. As a general rule the forms in *-or* are masculine; *i.e.* they give us the names of men rather than women. An *actor* is a *man* who *acts*; a *female* who *acts* being an *actress*.

Now, words in *-ess*, like words in *-or*, are of Latin origin; either directly or indirectly. The Latin termination is *-ix*, which, in French, becomes *-ice*. In Anglo-Saxon it has no existence at all; so that Feminines in *-ess* match masculines in *-or*, not masculines in *-er*. The French equivalent to *-or* is *-eur*: so that *actor* becomes *acteur*.

It is true, indeed, that in some few cases we attach the syllable *-ess* to words of English origin. So accurate a writer as Ben Jonson uses the word *huntress*.

> Queen and *huntress* chaste and fair,
> Now the sun is lain to sleep,
> Seated in thy silver chair,
> State with wonted splendour keep.
> Hesperus invokes thy light,
> Goddess exquisitely bright.
>
> CYNTHIA'S REVELS.

The word, however, is exceptionable; as are all words (though there are many of them in the language) which are made up out of two languages. Let any one write *bakor*, *singor*, *fishor*, and form from them such words as *bakress*, *singress*, *fishress*, and he will see that the combination is, to say the least of it, unfamiliar.

§. We continue our observations on these words in *-ess*. In *actor* and *actress* there is a change from one syllable to another.

But this is not always the case. There are many masculines in which no such syllable as *-or* is to be found, and where the feminine is formed by the addition, rather than the substitution, of *-ess*. Such are—*Peer*, *Duke*, *Marquis*, for the Masculine; *Peeress*, *Duchess*, *Marchioness*, for the Feminine.

§. Some notice of the forms of *-er* is now required.

And first we ask of what gender are they? The answer to this

is, that they are, in the first instance, masculine. In practice, however, they are of no gender at all. A *baker* may be either a man or a woman. It is certain that we may talk of a female *singer*, or a female *dancer;* though, at the same time, there are many who would prefer to say *songstress* or *danseuse.* The fact is, that the true English form of the feminine verbal is nearly obsolete. It is, however, the syllable *-ster.* In Anglo-Saxon—

Sangere, *a male singer,* Bæcere, *a male baker,* Fithelere, *a male fiddler,* Webbere, *a male weaver,* Rædere, *a male reader,* Seamere, *a male seamer,*	were opposed to	Sangestre, *a female singer.* Bacestre, *a female baker.* Fithelstre, *a female fiddler.* Webbestre, *a female weaver.* Rædestre, *a female reader.* Seamestre, *a female seamer.*

In the Dutch *waschter* means *washerwoman.* In English, however, the only true representative of the old form is the word *spinster*, meaning a *female who spins.* The opposite to this is *spinner.* As to the words *Baxter*, *Webster*, and *Brewster*, they are now known only as proper names. Originally, however, they meant a *female baker*, a *female weaver*, and a *female brewer.*

§. The importance of a clear knowledge of the process of abstraction is very great. In all researches into our modes of thought it plays a conspicuous part. The present work, however, is upon Grammar rather than Mental Philosophy; so that its full value will not be exhibited. At the same time, it is of high importance even in grammar; especially in the consideration of the Verb—the part of speech which is now coming under notice. It is of high import in all grammars; but especially in that of the English language. In the English language we have such lines as

To err is human, *to forgive* divine—
To be or not to be, that is the question—

in which a Substantive in the Nominative Case is represented by a Verb with a Preposition before it. *To err* means *error* and *to forgive* means *forgiveness.* How is this? Let us see how far the idea of abstraction helps us to an answer; and let us take the Adjective first.

§. Abstraction means *drawing off*, from the Latin *abs* = *from*, and *traho* = *I draw.* Two objects such as a ribbon and an orange, are yellow. I have a clear notion of both. But suppose that I wish to consider the quality common to the two. It is manifest that I must separate, or draw it off from the roundness, the fragrance, and the other qualities of the fruit, as well as from the texture, the pattern, and the other qualities of the ribbon. I must take it by itself. I must get the idea of yellowness, independent of the particular objects to which it may be attached.

§. And so I act with the Verbal. A horse may *run*, or a man may *run.* The horse may *run* to-day, the man may have *run* yesterday; but if I wish to have the notion of the act of *running*, I

must separate, or *draw it* off, from both the horses and the men who perform it, as well as from the time at which it was performed.

In both these cases the result is something which I can imagine, but which I cannot perceive through any of my senses. I can see a *man* in a *state of happiness* and I can see a *horse* in the *act of running*. *Happiness*, however, without some happy object, or *the act of running*, without some object that runs, I cannot perceive, though I can imagine it.

Both, however, are Substantives; one being the name of a quality, the other that of an action.

§. For the present this is nearly all that need be said. We are passing from one of the chief parts of speech to another, from the Pronoun, the Substantive, and the Adjective, to the Verb and Participle. Which class is the most important is difficult to say. The Verb, by many grammarians, is looked upon as the primary part of speech, and from this view it derives its name. The Latin *verbum* means *word*, and the Verb has been held to be pre-eminently *the word* in language. Whether this doctrine be right or wrong need not now be asked. The object of the present remarks is to show that the difference between the two great classes is by no means very great; and in order to do this, an apparent deviation from the right line of investigation has been resorted to. The Verbal is evidently derived from the Verb; and the Verb is the basis of the Verbal. Yet the Verbal, though a secondary and derived form, has been taken first. However, by thus taking it, we show more clearly the connection between the Verb and the Substantive.

We can deprive the Verbal of its terminations, and reduce such words as *hunter* and *hunting* to *hunt;* where we have the expression of action without an agent. This gives an abstraction; an abstraction which, though different in its details from that by which Adjectives are affected, is one of the same kind.

VERBS.

126. A word which can, by itself, form both a Predicate and a Copula, is called a Verb. *I call; he speaks.*

127. Verbs can be resolved into their elements, and that part which coincides with the Predicate can be separated from that which coincides with the Copula. *I call = I am calling; he speaks = he is speaking.*

128. That part of the Verb which gives the Predicate is called a Participle. *Calling*, *speaking*, *called*, and *spoken* are Participles.

129. The words which give the Copula are *am*, *art*, *is*, *are*, *was*, and *were*.

§. In such propositions as *I am speaking, thou art writing, he is singing, she is playing, it is burning, we are speaking, ye are singing, they are playing, summer is coming, winter is departing, the horses are feeding, the sun is shining brightly, the rain is falling fast this morning, I was moving, we were speaking*, &c.,—the words *am, art, is, are, was*, and *were* connect the subjects *I, thou, he, she, it, we, ye*, &c., with the predicates *speaking, writing, singing*, &c. Hence their name *copula* = *link*.

130. Verbs express actions. Actions are either Intransitive or Transitive.

131. Intransitive actions imply an agent and an act; as *I sleep, I walk*, and *I live*.

132. Transitive actions imply an agent, an act, and an object acted on; as *I strike the ball; he loves his parents; Brutus killed Cæsar*.

133. Certain Transitives have Intransitives with which they correspond, and from which they are formed by changing the vowel. Thus, *rise, lie, sit, fall, drink*, are Intransitive; *raise, lay, set, fell, drench*, Transitive. To *rise* is to *raise oneself*. To *fell* is to *make to fall*.

§. In Anglo-Saxon, these pairs of words were much more numerous then they are at present. There were, for instance, in Anglo-Saxon—

Intransitive.		*Transitive.*	
Yrnan,	*to run.*	Ærnan,	*to make to run.*
Byrnan,	*to burn.*	Bærnan,	*to make to burn.*
Drincan,	*to drink.*	Drencan,	*to drench.*
Sincan,	*to sink.*	Sencan,	*to make to sink.*
Licgan,	*to lie.*	Lecgan,	*to lay.*
Sittan,	*to sit.*	Settan,	*to set.*
Drífan,	*to drift.*	Dræfan,	*to drive.*
Fealłan,	*to fall.*	Fyllan,	*to fell.*
Weallan,	*to boil.*	Wyllan,	*to make to boil.*
Fleogan,	*to fly.*	A-fligan,	*to put to flight.*
Beogan,	*to bow.*	Bigan,	*to bend.*
Faran,	*to go.*	Feran,	*to convey.*
Wacan,	*to wake.*	Weccan,	*to awaken.*

134. In respect to their inflection Verbs are (1)

related to the Substantive, (2) related to the Adjective, and (3) characterized by peculiarities of their own.

135. So far as the Verb is related to either the Substantive or the Adjective it is Declined. So far as it is characterized by peculiarities of its own it is Conjugated.

136. The Declension of the Verb in Anglo-Saxon was fuller than it is in the present English.

137. In Anglo-Saxon there was a true Infinitive Mood which ended in *-an*, as *bærnan* = *burn*, *lufian* = *love*. When this was preceded by *to*, *-an* became *-enne*; as *to lufienne* = *to love*, *to bærnenne* = *to burn*.

§. That this form in *-enne* was distinct from the one in *-an* is so clear that it would be a waste of time to enlarge on the fact of its being so. It is more important to state that a difference of construction closely agreed with this difference of form, and that traces of it are to be found even at the present moment.

A well-known rule tells us that the latter of two verbs is in the Infinitive Mood, and that the sign of the Infinitive Mood is the preposition *to*. This is illustrated by such phrases as the following:—*I wish to speak; thou meanest to go; he prepares to fight.*

But besides such combinations as these, there is a second series, wherein no such word as *to* is to be found. The words *can*, *may*, *shall*, *will*, and a few others are just as much verbs as *wish*, *mean*, or *prepare*; yet their construction is different. No one says *I can to speak*, or *I may to go;* but, on the contrary, *I may go*, or *I can speak*. The explanation of this lies in the original difference between the forms in *-an* and *-enne*. After *can*, *may*, &c., the former, after the other verbs the latter, was used.

§. If two words differ from each other in their endings only, and those endings be lost, the difference will be abolished. From bærn-*an* take *-an*, from bærn-*enne* take *-enne*, and the result is bærn. From *bærn-an*, however, comes the *burn* in *I can burn;* and from *bærn-enne* the *burn* in *I begin to burn*.

§. The next point which comes under consideration is the nature of these forms. To the reader who has clearly seen that the abstract verb agrees with the substantive, they will present no great difficulty. Still less will they perplex any one who has gone through the elements of the Latin Grammar, and knows what is meant by an Infinitive Mood or a Gerund. Such a reader will at once compare

Lufian = *love* with *amare.*
Bærnan = *burn* —— *urere.*

and

To lufienne = *to love* with *ad amandum.*
To bærnenne = *to burn* —— *ad urendum.*

§. The Participle, or that portion of the Verb which approaches the Adjective, is, like the Adjective itself, undeclined, though only in the present stage of the language. Indeed it is only in the present stage of the language that the Adjective itself is destitute of either case or number. In Anglo-Saxon it had not only as many cases as the Substantive, but it had a Gender as well. Thus *good* was declined thus :—

Singular.

	Masculine.	*Feminine.*	*Neuter.*
Nominative.	Gód	Gód	Gód
Accusative.	Gódne	Góde	Gód
Ablative.	Góde	Gódre	Góde
Dative.	Gódum	Gódre	Gódum
Genitive.	Gódes	Gódre	Gódes.

Plural.

	Masculine.	*Feminine.*	*Neuter.*
Nominative.	Góde	Góde	Góde
Accusative.	Góde	Góde	Góde
Ablative.	Gódum	Gódum	Gódum
Dative.	Gódum	Gódum	Gódum
Genitive.	Gódra	Gódra	Gódra.

§. More than this—the Anglo-Saxon Adjective had two declensions. The one just exhibited was called Indefinite, and was used in such phrases as *a good man*, *a good woman*, *good men*, *good things*, &c. Where, however, the article was Definite, and the phrases were *the good man*, &c., the forms in *-re*, *-ra*, &c., disappeared, and *-an* was placed in their stead.

Singular.

	Masculine.	*Feminine.*	*Neuter.*
Nominative.	Góde	Góda	Góde
Accusative.	Gódan	Gódan	Gódan
Ablative.	Gódan	Gódan	Gódan
Dative.	Gódan	Gódan	Gódan
Genitive.	Gódan	Gódan	Gódan.

Plural.

	Masculine.	*Feminine.*	*Neuter.*
Nominative.	Gódan	Gódan	Gódan
Accusative.	Gódan	Gódan	Gódan
Ablative.	Gódum	Gódum	Gódum
Dative.	Gódum	Gódum	Gódum
Genitive.	Gódena	Gódena	Gódena

That the declension of the Participle was virtually that of the Adjective is shown by the following :—

Singular.

	Masculine.	*Feminine.*	*Neuter.*
Nominative.	Bærnand	Bærnand	Bærnand
Accusative.	Bærnandne	Bærnande	Bærnand
Ablative.	Bærnande	Bærnandre	Bærnande
Dative.	Bærnandum	Bærnandre	Bærnandum
Genitive.	Bærnandes	Bærnandre	Bærnandes.

Plural.

	Masculine.	*Feminine.*	*Neuter.*
Nominative.	Bærnande	Bærnande	Bærnande
Accusative.	Bærnande	Bærnande	Bærnande
Ablative.	Bærnandum	Bærnandum	Bærnandum
Dative.	Bærnandum	Bærnandum	Bærnandum
Genitive.	Bærnandra	Bærnandra	Bærnandra.

138. Verbs, when Conjugated, have Number, Person, Mood, and Tense.

139. The Numbers are two—the Singular and the Plural. *I was; we were.*

140. The Persons are three, *I speak; thou speakest; he speaketh* or *speaks.*

141. The Moods are four — the Indicative, the Imperative, the Subjunctive, and the Infinitive. The Indicative gives a positive act; as *the sun continues to shine.* The Subjunctive gives an act under certain conditions; as *if the sun continue to shine, the frost will break up.* The Infinitive has already been considered.

142. The Subjunctive mood differs from the Indicative only by rejecting the signs of person. We say *thou chidest, he chideth* (or *chides*), where the forms are Indicative. In the Subjunctive we say, *if thou chide, if he chide.* The only exception to this is *was;* where the change goes further, and where the Subjunctive is *were.* The Imperative is exactly of the same form as the Subjunctive.

143. The Tenses are two—the Present and the Preterite or Past.

144. The Present denotes an action habitually performed. *I honour integrity; I love my country.*

145. The Past denotes an action that has taken place in time past and has already been performed. *I honoured integrity; I loved my country.*

146. The Preterite is formed from the Present by adding *-ed;* which is sometimes sounded, as in *blind, blinded;* sometimes mute, as in *move, moved.*

147. The *-d* of the Preterite is in some cases sounded as *-t.* What we write *dipped* we pronounce *dipt.* In some words the letter *t* is actually written, as *weep, wept.*

148. The following forms were developed when our language contained two Preterites, one of which was formed by changing the vowel of the Present.

Fall	Fell	Eat	Ate	Spin	Spun
Hold	Held	Tread	Trod	Win	Won
Draw	Drew	Come	Came	Sing	Sang
Slay	Slew	Overcome	Overcame	Spring	Sprung
Fly	Flew	Become	Became	Sting	Stung
Blow	Blew	Bid	Bade	Ring	Rang
Crow	Crew	Forbid	Forbade	Wring	Wrung
Know	Knew	Give	Gave	Fling	Flung
Grow	Grew	Forgive	Forgave	Cling	Clung
Throw	Threw	Wake	Woke	Hang	Hung
Beat	Beat	Strike	Struck	String	Strung
Weave	Wove	Arise	Arose	Sling	Slung
Freeze	Froze	Abide	Abode	Sink	Sunk
Steal	Stole	Smite	Smote	Drink	Drank
Speak	Spoke	Ride	Rode	Shrink	Shrunk
Swear	Swore	Stride	Strode	Dig	Dug
Bear	Bore	Drive	Drove	Stick	Stuck
Tear	Tore	Thrive	Throve	Run	Ran
Wear	Wore	Strive	Strove	Burst	Burst
Break	Broke	Write	Wrote	Bind	Bound
Shake	Shook	Climb	Clomb	Find	Found
Take	Took	Bite	Bit	Grind	Ground
Forsake	Forsook	Swim	Swam	Wind	Wound
Get	Got	Begin	Began	Choose	Chose.

PARTICIPLES.

149. The Participles in English are two; the Present and the Past.

150. The Present always ends in *-ing*, as com-*ing*, plant-*ing*, writ-*ing*.

151. The Past varies in form, which is *generally* regulated by that of the Past Tense.

152. When the Preterite Tense ends in *-ed*, or *-t*, the Participle, *for the most part*, does the same, as *I called, I have called.*

§. This identity, however, is accidental. The Anglo-Saxon form of the Preterite was *-ode*, *-de*, or *-te*, as *lufode*, *bærnde*, *dypte* = *loved*, *burnt*, *dipped*. Meanwhile the Participle ended in *-ed* or *-t*, as *-lufod*, *-bærned*, *-dypt*.

153. When the Preterite is formed by changing the vowel, the Participle, *for the most part*, ends in *-n*.

Present.	*Preterite.*	*Participle.*	*Present.*	*Preterite.*	*Participle.*
Fall	Fell	Fallen	Shear	Shore	Shorn
Hold	Held	Holden	Wear	Wore	Worn
Draw	Drew	Drawn	Break	Broke	Broken
Shew	Shewed	Shewn	Shake	Shook	Shaken
Slay	Slew	Slain	Take	Took	Taken
Fly	Flew	Flown	Get	Got	Gotten
Blow	Blew	Blown	Eat	Ate	Eaten
Crow	Crew	Crown	Tread	Trod	Trodden
Know	Knew	Known	Bid	Bade	Bidden
Grow	Grew	Grown	Forbid	Forbade	Forbidden
Throw	Threw	Thrown	Give	Gave	Given
Beat	Beat	Beaten	Arise	Arose	Arisen
Weave	Wove	Woven	Smite	Smote	Smitten
Freeze	Froze	Frozen	Ride	Rode	Ridden
Steal	Stole	Stolen	Stride	Strode	Stridden
Speak	Spoke	Spoken	Drive	Drove	Driven
Swear	Swore	Sworn	Thrive	Throve	Thriven
Bear	Bore	Borne	Strive	Strove	Striven
Bear	Bare	Born	Write	Wrote	Written
Tear	Tore	Torn	Bite	Bit	Bitten.

§. Attention should be paid to the words "*generally*" and "*for the most part*" in rules 151, 152, and 153. There are several exceptions.

1. The verbs *engrave*, *hew*, *lade*, *mow*, *sow*, *shave*, *shew*, *strew*, and some others, form their preterites in *-d*, as *engraved*, *hewed*, *laded*, *mowed*, &c. Nevertheless, their participles end in *-n*, as *engraven*, *hewn*, *laden*, *mown*, *sown*, *shaven*, *shewn*, *strewn*.

2. Several words which in Anglo-Saxon ended in *-en*, have, in the present stage of the language, dropped that ending.

Come, Shone, Swum, Run, &c., } were in Anglo-Saxon { *Ge*-cum*en*, *Ge*-scin*en*, *Ge*-swumm*en*, *Ge*- runn*en*, &c.

From *drunk* and *sink* we may form either *drunk* or *drunken*, *sunk* or *sunken*. No one, however, says *I have sungen a song*; but, rather *I have sung one.*

§. The prefix *ge-* deserves notice. In Anglo-Saxon it was as necessary a part of the past participle as the terminations *-d*, or *-n* ; and so it is in German at the present moment. The German says—

Ich habe *ge*sagt = I have said.
Ich habe *ge*sehen = I have seen, &c.

In modern English, however, it is obsolete. At the same time, it occurs in a word, which, though only found in such writings of the present century as affect an antiquated form, occurs in a poem so well known as the Allegro of Milton—

But hail thou, goddess, fair and free,
In heaven *ycleped* Euphrosyne ;
But by men heart-easing mirth, &c.

It means *called ;* and was in Anglo-Saxon, *geclepod*, from *clepian = to call.*

§. The words like *engraven*, *mown*, &c., were quoted, in order to show that a participle in *-n* was compatible with a preterite in *-d*. It must not, however, be supposed that they exclude the ordinary form. Concurrently with—

Engraven, Mown, Shewn, &c., } we have { Engraved, Mowed, Shewed.

Between these two participles many writers draw a distinction, of which notice will be taken in the syntax.

154. Certain words have two forms for the Preterite, one in *a*, another in *u*. When this is the case the Participle agrees with the latter. We cannot correctly say *I have swam*, *I have began*, *I have ran*, though many are in the habit of so doing.

Present.	1*st Preterite.*	2*nd Preterite.*	*Participle.*
Swim	Swam	Swum	Swum
Begin	Began	Begun	Begun
Sing	Sang	Sung	Sung
Sink	Sank	Sunk	Sunk
Drink	Drank	Drunk	Drunk
Run	Ran	Run	Run.

§. If we ask how this double form originated, we shall find our answer in the Anglo-Saxon, where words like *sing*, *swim*, &c., changed *i* into *a*, and became *sang* and *swam*. However, in the *second* person Singular, and in *all* the persons of the Plural, a second change took place, and *a* became *u*.

Singular.		*Plural.*	
Ic sang	*I sang*	We sungon	*we sung*
þu sunge	*thou sungest*	Ge sungon	*ye sung*
he sang	*he sang*	Hi sungon	*they sung.*

This shows that in such a form as *thou sangest* a double departure from the old practice has taken place. The *a* is the vowel of the first and third persons, whilst the *-st* is borrowed from the second person singular of the Present.

There are other words where this double form prevails, and where it is explained on the same principle.

The Preterites of *smite* are *smote* and *smit*. In Anglo-Saxon, *smát* was the singular, *smiton* the plural, form. Similarly—

Ic bat	*I bit*	biton	*we bit*
Ic scean	*I shone*	we scinon	*we shone*
Ic arás	*I arose*	we arison	*we arose.*

155. *Be* takes three forms—*be*, *being*, and *been*. The form *be-est*, used by Milton, is obsolete.

156. *Be* is only used in Commands, in Conditional Propositions, and in the Infinitive Mood—as, *be gone —if it be so—I wonder how it can be—I wish to be alone.*

157. *Being* is the Present, *been* the Past Participle —*Whilst one was being planted, the other was being cut down—I have been at work.*

158. *Am* takes four forms; as—*I am; thou art; N. or M. is; we, ye, they are.*

159. The *-m* in *a-m* is no part of the original word, but the sign of the first person. *Am* is the only word that has such a sign.

160. The *-t* in *ar-t*, as a sign of the second person singular, is found in three other words, *wast* (and *wert*), *shalt*, and *wilt*.

§. The evidence that *is* is connected with *am*, *art*, and *are* can only be got through the allied languages.

Sanskrit	Asmi	Asi	Asti
Lithuanic	Esmi	Essi	Esti
Slavonic	Yesmi	Yesi	Yesty
Latin	Sum	Es	Est
Mœso-Gothic	Im	Is	Ist
Anglo-Saxon	Eom	Art	Is

161. *Was* is found in two Moods—the Indicative and the Subjunctive.

Indicative.

I was	*We were*
Thou wast	*Ye were*
He was	*They were.*

Subjunctive.

If I were	*If we were*
If thou wert	*If ye were*
If he were	*If they were.*

§. It is usual to call the verb *be* irregular, and to conjugate *am* and *was* as if they belonged to it. That this is incorrect is plain, inasmuch as there is no etymological connection between the three words. They are separate verbs, expressive of a similar idea. Each is defective in some part of its conjugation; whilst the parts which are wanting in one are made by the forms of the other two. There is no Preterite to *be* and *am*, no Present to *was*.

§. In *was* and *were* observe the change from *s* to *r*.

162. In Anglo-Saxon, there were a few words which changed *s* into *r* in the Participle.

Ceóse, *I choose;* ceâs, *I chose;* curon, *we chose;* gecoren, *chosen.*
Forleóse, *I lose;* forleâs, *I lost;* forluron, *we lost;* forloren, *lost.*
Hreose, *I rush;* hreâs, *I rushed;* hruron, *we rushed;* gehroren, *rushed.*

This accounts for the Participial form *forlorn* or *lost.*
In Milton's lines,

——————————— the piercing air
Burns *frore*, and cold performs the effect of fire.
Paradise Lost, b. ii.,

we have a form from the Anglo-Saxon *gefroren* = *frozen.*

§. The preceding rules are sufficient to give a general idea of the principles upon which the Past Tense and the Past Participle are formed. There are, however, several details which still stand over for notice. The Preterite, even in its simplest form, is by no means invariable. That it sometimes ends in *-ed*, sometimes in *-d*, and sometimes in *-t* has already been stated. We have not, however, said under what circumstances these several endings are used.

In respect to *-ed* we sometimes sound it in *all* words, viz. when we declaim or utter words of special solemnity. In reading the

actual text of the Scriptures we say *bless-ed:* only, however, in the actual text. In the *version* of the Psalms we make the word a monosyllable, *e. g.*

How *blessed* is he who ne'er consents.

In ordinary conversation and reading *-ed* is only sounded when the original word ends in *-d* or *-t*, as *instruct*, *slight*, where we say *instructed* and *slighted*, because *instrucktt* and *slightt* would be unpronounceable.

§. *T* is added when the original word ends in *-p*, *-k*, *-s*, or *-sh*; as *dip*, *pluck*, *toss*, *push*. Here, although we write

Dipped, Plucked, Tossed, Pushed, } we pronounce the words { Dipt. Pluckt. Tosst. Pusht.

In most other cases the addition is the simple sound of *-d*—*serve*, *served*; *cry*, *cried*; *fill*, *filled*; *stab*, *stabbed*, &c.; wherein the Present and Preterite have the same number of syllables. This would not be the case if *-ed* were actually added. All such words as *whizzed*, *stabbed*, *judged*, *filled*, &c., though dissyllables to the eye, are monosyllables to the ear.

§. Such are the changes which affect the *end* of the word. In many cases, however, the middle parts are changed and the vowel of the root is altered.

Sometimes it is simply shortened, as *leave*, *left*; *creep*, *crept*; *flee*, *fled*.

Sometimes it is actually changed, as *tell*, *told*; *sell*, *sold*.

§. Sometimes there is a change of the *consonant*. The most remarkable words in this respect are the following:—

1. *Bought*, from *buy*. The Anglo-Saxon was *bycgan* and *bohte*.
2. *Sought*, from *seek*. The Anglo-Saxon was *secan* and *sohte*.
3. *Beseech* is a compound of *seek*. Hence its preterite is *besought*.
4. *Taught*, from *teach*. Anglo-Saxon, *tæcan* and *tohte*.
5. *Caught*, from *catch*. Anglo-Saxon, *cacan*, *cahte*.
6. *Brought*, from *bring*. Anglo-Saxon, *bringan* and *brohte*.
7. *Thought*, from *think*. Anglo-Saxon, *thencan* and *thohte*.
8. *Wrought*, from *work*. Here there is a transposition as well as a change. The Anglo-Saxon was *wyrcan* and *wrohte*.

It is not difficult to discover the reason for these apparent irregularities. All the words of the preceding list contain the sound of either *g* (as in *go*), or its ally *k* (or *c*); sounds which have a great tendency to change. They pass into *h*, into *y*, into *tsh*, and into *dzh*. The details, however, of these changes belong to the province of the general grammarian.

163. *Made*, *had*, and *laid* are contractions. The older forms were *macode*, *hæfde*, and *legde*.

§. The confusion between *lie* and *lay* is so common, and, at the same time, so blameworthy, that it is advisable to notice it. To *lie* is a verb neuter or intransitive, the preterite of which is *lay*. To *lay* is a verb transitive, the preterite of which is *laid*. In meaning the words are as different as *sit* and *set*, one meaning simply to *lie down*, the other to *cause to lie down*. We may say either *I lie down to sleep*, or *I lay myself down*, in the Present Tense. We may also, in the Preterite, say *I lay down* or *laid myself down*. We cannot, however, say *I mean to lay down*, nor yet *I mean to lie myself down*.

The proper Participle of *lie* is *lien*. It is, however, nearly replaced by the newer form *lain*.

164. *Dare* is both Intransitive and Transitive. We can say *I dared to fight* and *I dared* (or *challenged*) *him to fight*.

165. *Durst* is Intransitive only. It never means *challenge*. It can, however, be used both as a Present and as a Preterite. We can say, *I durst not do so now*, and *I durst not so when you spoke to me*.

166. *He owned to having done it* means, *he admitted*, *conceded*, or *granted that he had done it*. When *own* has this sense it is a different word from the *own* which signifies *possess*, and comes from the Anglo-Saxon *an*, meaning *I have granted*, of which the plural is *unnon*.

167. *Own* meaning *possess* is a different word from *own* meaning to *grant*. It comes from *owe*, and until after the reign of Elizabeth was destitute of the *-n*.

> See where he comes ; nor poppy nor mandragora,
> Nor all the drowsy syrups of the world,
> Shall ever med'cine thee to that sweet sleep
> Which thou *owed'st* yesterday.—*Othello*.

168. *Owe*, the older form of *own*, meaning *possess*, comes from the Anglo-Saxon *ah*, meaning *I have acquired*, of which the plural is *ágon*.

169. The Anglo-Saxon Preterite of *sceal* was *sculde* ; so that the *l* in *should*, though not pronounced, be-

longs to the word. The same is the case with *would* from *will*.

Here we may remark that the second person singular of *shall* ends in *-t*, as *shalt*. So does the second person singular of *am*, *was*, *were*, and *will*, which are *art*, *wast*, *wert*, and *wilt*.

170. The Anglo-Saxon preterite of *can* was *cuðe*, in Old English, *coud*. The *-l* of the present language is not sounded and ought not to be written. It is inserted after the false analogy suggested by the words *would* and *should*.

171. The Anglo-Saxon form of *may* was *mag*, of which the plural was *mugon*. Hence the *-g-* in *might*.

172. *That dress becomes you* means *that dress suits you*. When *become* has this sense it is a different word from the *become* in such phrases as *the weather became colder*. It comes from the Anglo-Saxon *beqweman*, of which the preterite was *beqwemede*, and corresponds with the German *bequem* = *convenient*.

173. *Become* in such phrases as *the weather became colder* is a different word from *become* meaning *to suit*. It comes from Anglo-Saxon *becomman*, of which the preterite was *becam*.

174. *This will do* means *this will answer the purpose*. When *do* has this sense it is a different word from the *do* which signifies *to act*. It comes from the Anglo-Saxon *deáh*, of which the preterite was *dohte*, and corresponds with the word *taugen* in German and *duge* in Danish. In its present form it has lost a *-g*.

175. *Do* meaning *to act* is a different word from *do* meaning *to answer the purpose*. It comes from the Anglo-Saxon *dó*, of which the preterite is *dyde*, and corresponds with the German *thun*.

176. In *did* it is the first *d* which is the sign of

the tense; the second the consonant of the original verb.

§. This rule, which at first sight appears to be both unimportant and inaccurate, is one of the most interesting in the whole grammar. It gives us the fragment of an inflection which was once as common as the preterite in *-d* or the participle in *-ing*. It takes us back to a period in our language which has long passed by—not, however, without leaving traces of both its existence and its influence. What these are will be shown as we proceed. Meanwhile, it is convenient to know what is meant by the word Mœsogothic, and to study the following table, which gives us the classification of a great number of Mœsogothic verbs.

In the fourth century of our æra, the rich valleys of the Lower Danube, the Pruth, and the Dniester were occupied by a population of victorious Germans, who appear to have originated in the southern parts of Thuringia, to have forced their way across that part of Bavaria which lies to the north of the Danube, to have followed the course of that river, to have reached the country of the Getæ, and to have been denominated Goths. In parts of Wallachia, Moldavia, Bessarabia, and the Ukraine, they seemed to have fixed themselves more or less partially. In Hungary and Austria they became dominant. In Bulgaria they can be shown to have been powerful. Now, as the ancient name of Bulgaria was Mœsia, the German of that district has been called Mœsogothic. It is, by no means, an unexceptionable name; though this is not the place to discuss its demerits. During the fifth century some of these tribes were converted to Christianity, when portions of the Scriptures were translated into their language. Of these, fragments have come down to us, and it may easily be believed that, from their high antiquity, they have commanded no little attention. They are the oldest specimens of any of the languages akin to the English; and in the English itself they explain many forms which would otherwise be mysterious. Amongst these is the one under notice—*did* from *do*.

In the Mœsogothic, the preterites, which in English and Anglo-Saxon are formed by changing the vowel (*swim*, *swum*), fall into twelve classes, of which the first two present no change at all. In *salta* = *I leap*, and *háita* = *I call*, there is neither the addition of *-d* nor the alteration of the vowel. The *a* and *ái* of the present are also the *a* and *ái* of the preterite.

There *is*, however, a change; a change which consists in the reduplication of the initial consonant; a change which converts *salta* into *saisalt*, and *háita* into *háiháit*.

In the next four groups, the reduplication continues, but the vowel is changed as well.

In the last six the vowel is changed, but the reduplication ceases.

All this is made clear by the following table:—

		Present.	*Preterite.*	*English.*		
Simple reduplication.	1.	Salta	Sái-sailt	*Leap*	and	*Leaped.*
	2.	Háita	Hái-háit	*Hight*	„	*Hight.*
Reduplication, and change of vowel.	3.	Stáuta	Stái-stáut	*Strike*	„	*Struck.*
	4.	Slêpa	Sái-zlêp	*Sleep*	„	*Slept.*
	5.	Láia	Taiiô	*Laugh*	„	*Laughed.*
	6.	Grêta	Gáigrôt	*Weep*	„	*Wept.*
Change of vowel only.	7.	Svara	Svôr	*Swear*	„	*Swore.*
	8.	Greipa	Gráip	*Gripe*	„	*Griped.*
	9.	Buida	Báup	*Bid*	„	*Bade.*
	10.	Giba	Gab	*Give*	„	*Gave.*
	11.	Stila	Stal	*Steal*	„	*Stole.*
	12.	Rinna	Rann	*Run*	„	*Run.*

Did, then, is a preterite formed by reduplication. And (as has been already stated) it is the only one which the present state of our language supplies. Whether it is the only one in English is another question. Under the same conditions under which we found the obsolete participle *yclept* (see p. 41), we find another word, viz. *hight*, which means *bear the name* or *be called.*

> An ancient fabric, raised t' inform the sight,
> There stood of yore, and Barbican it *hight.*—DRYDEN.

i. e. *it bore the name of Barbican.* In this word the *g* is entirely out of place, the proper spelling being *hiht.* In Anglo-Saxon it was *hêht*, and we have shown that the Mœsogothic form was *háihâit.*

§. The details of the word *did* are not the only matters in which the attentive perusal of the Mœsogothic conjugation may instruct us. In the first place, it entirely explodes the old notion of the preterites like *swum*, *spoke*, &c. (the preterites formed by changing the vowel of the present), being what used to be called *irregular.* The older the language the more decidedly they present themselves. In Anglo-Saxon, though, with the exceptions of *did* and *hêht*, the reduplication is lost, the classification is essentially the same as the Mœsogothic.

	Present.	*Preterite.*	*English.*		
1.	Fealle	Feol	*Fall*	and	*Fell.*
2.	Swape	Sweop	*Sweep*	„	*Swept.*
3.	Hleape	Hleop	*Leap*	„	*Leapt.*
4.	Slepe	Slep	*Sleep*	„	*Slept.*
5.	Blawe	Bleow	*Blow*	„	*Blew.*
6.	——	——	——	—	——
7.	Fare	For	*Fare*	„	*Fared.*
8.	Bide	Bad	*Bide*	„	*Bode.*
9.	Creope	Creap	*Creep*	„	*Crept.*
10.	Swefe	Swæf	*Slumber*	„	*Slumbered.*
11.	Nima	Nam*	*Take*	„	*Took.*
12.	Helpe	Healp	*Help*	„	*Helped.*

§. The forms *sweop*, *hleop*, *slep*, *for*, *creap*, and *healp* suggest a new inquiry. We see that in the Anglo-Saxon they were formed

* This word was in use in Shakespear's time, and signifies *take.*

after the fashion of *fell* and *swam;* whereas their representatives in the present English are formed by the addition of *-d* or *-t*. The same result is given by the Mœsogothic. What do we infer from this? We infer that there is a tendency for one form to be displaced by the other, and the more we compare the older stages of our language with the newer, the more clearly we see that such is actually the case. To the examples already given the following (and, doubtless, others) may be added. The following presents and preterites of the modern English end in *-d* or *-t*. In Anglo-Saxon they changed the vowel.

English.		A. S.		English.		A. S.	
Wreak	Wreaked	Wrece	Wræ'c.	Swallow	Swallowed	Swelge	Swealh.
Fret	Fretted	Frete	Fræ't.	Mourn	Mourned	Murne	Mearn.
Mete	Meted	Mete	Mæ't.	Spurn	Spurned	Spurne	Spearn.
Shear	Sheared	Scere	Scear.	Carve	Carved	Ceorfe	Cearf.
Braid	Braided	Brede	Bræ'd.	Starve	Starved	Steorfe	Stærf.
Knead	Kneaded	Cnede	Cnæ'd.	Thresh	Threshed	Thersce	Thærsc.
Dread	Dreaded	Dræ'de	Dred.	Hew	Hewed	Heawe	Heow.
Sleep	Slept	Slápe	Slep.	Flow	Flowed	Flówe	Fleow.
Fold	Folded	Fealde	Feold.	Row	Rowed	Rówe	Reow.
Wield	Wielded	Wealde	Weold.	Creep	Crept	Creópe	Creáp.
Wax	Waxed	Weaxe	Weox.	Dive	Dived	Deófe	Deáf.
Leap	Leapt	Hleápe	Hleop.	Shove	Shoved	Scéofe	Sceáf.
Sweep	Swept	Swápe	Sweop.	Chew	Chewed	Ceówe	Ceáw.
Weep	Wept	Wepe	Weop.	Brew	Brewed	Bréowe	Breáw.
Sow	Sowed	Sáwe	Seow.	Lock	Locked	Lûce	Leác.
Bake	Baked	Bace	Bók.	Suck	Sucked	Sûce	Seác.
Gnaw	Gnawed	Gnage	Gnóh.	Reek	Reeked	Reóce	Reác.
Laugh	Laughed	Hlihhe	Hlóh.	Smoke	Smoked	Smeóce	Smeác.
Wade	Waded	Wade	Wód.	Bow	Bowed	Beóge	Beáh.
Lade	Laded	Hlade	Hlód.	Lie	Lied	Leóge	Leáh.
Grave	Graved	Grafe	Gróf.	Gripe	Griped	Grípe	Gráp.
Shave	Shaved	Scafe	Scóf.	Span	Spanned	Spanne	Spén.
Step	Stepped	Steppe	Stóp.	Eke	Eked	Eáce	Eóc.
Wash	Washed	Wacse	Wócs.	Fare	Fared	Fare	Fôr.
Bellow	Bellowed	Belge	Bealh.				

A great many of these old forms are still to be found by those who know where to seek them, viz. amongst the provincial dialects of Great Britain, where they are stigmatized as vulgarisms, though they belong to the language as it was spoken by the venerable Bede and written by the learned Alfred.

§. The change from the forms in *-d* or *-t* to the forms in a vowel is extremely rare; neither do any words of foreign origin and recent introduction ever form their preterites in the olden manner.

§. There are other points upon which the Mœsogothic reduplication throws a light; and, though its operation shows itself most clearly and readily to the classical scholar, it is, by no means, too complex for those whose knowledge is limited to their native tongue, provided that they will master the following preliminaries:—

1. In both the Latin and the Greek there are not only two

forms for the preterite tense, but two meanings also. Where *we* use a circumlocution, and combine the participle with the verb *have*, the Greeks availed themselves of an inflection, and expressed such a phrase as *I have written* by the single word *gegrafa*. Meanwhile, *egrapsa* stood for *I wrote*. The effect of this was to give the language two tenses; both tenses of past time, though not exactly expressive of the same idea.

2. The same was the case in Latin, except that though both forms were to be found in the language, they were seldom, if ever, to be found in the same word. As a consequence of this their meaning was uncertain. *Cucurri*, a preterite of *curro*, meant either *I ran* or *I have run*. Meanwhile, no such word as *cursi* is known. On the other hand, *rexi* (*reg-si*), from *rego* = *I rule*, meant either *I have ruled* or *I ruled*—no such form as *re-regi* existing. From facts like these the Latin language is considered to have but one preterite tense, though it is clear that, originally, there were two.

3. It is reasonably believed that the same is the case in the English and the languages allied to it; in all of which the forms like *did*, *spoke*, and *swum* coincide with the forms like *cucurri* and *gegrafa*, whilst those in *-d* or *-t* coincide with *egrapsa* and *rexi*. The exact details are, indeed, different. The principle, however, is the same. Two tenses, originally distinct, coalesce into one—some verbs keeping to one form, some to the other.

177. *Quoth* is defective, being found in the third person preterite only. In composition, however, its inflection is complete. and we say—*I bequeath, thou bequeathest, he bequeathes, we bequeathed, he was bequeathing.*

On the Combinations of the English Verb with the Auxiliaries.

We have said (Paragraph 143) that there are Two Tenses; the Present, and the Preterite or Past. And these represent the only two kinds of time which can be formed. in English, without the help of Auxiliary words. By the use, however, of the Auxiliaries, we get the following combinations, which are, in many cases, the equivalents to true tenses.

Infinitive Mood.

Present—To speak.

Preterite or Past—To have spoken.

Participles.

Present—Speaking. *Past*—Spoken.

INDICATIVE MOOD.

Present.

Singular.	*Plural.*
I speak, do speak, or am speaking.	We speak, do speak, or are speaking.
Thou speakest, dost speak, or art speaking.	You speak, do speak, or are speaking.
He speaks, does speak, or is speaking.	They speak, do speak, or are speaking.

Imperfect.

Singular.	*Plural.*
I was speaking, or did speak.	We were speaking, or did speak.
Thou wast speaking, or didst speak.	You were speaking, or did speak.
He was speaking, or did speak.	They were speaking, or did speak.

Preterite.

Singular.	*Plural.*
I spoke or have spoken.	We spoke or have spoken.
Thou spokest or hast spoken.	You spoke or have spoken.
He spoke or has spoken.	They spoke or have spoken.

Pluperfect.

Singular.	*Plural.*
I had spoken.	We had spoken.
Thou hadst spoken.	You had spoken.
He had spoken.	They had spoken.

Future.

Singular.	*Plural.*
I shall or will speak.	We shall or will speak.
Thou shalt or wilt speak.	You shall or will speak.
He shall or will speak.	They shall or will speak.

Future Preterite.

Singular.	*Plural.*
I shall or will have spoken.	We shall or will have spoken.
Thou shalt or wilt have spoken.	You shall or will have spoken.
He shall or will have spoken.	They shall or will have spoken.

IMPERATIVE.

Present.

Singular.	*Plural.*
Speak thou.	Speak ye.

SUBJUNCTIVE.

Present.

Singular.	*Plural.*
I may or can speak or be speaking.	We may or can speak or be speaking.
Thou mayest, &c., speak or be speaking.	You may, &c., speak or be speaking.
He may, &c., speak or be speaking.	They may, &c., speak or be speaking.

Preterite.

Singular.	*Plural.*
I might, could, would, or should speak or be speaking.	We might speak or be speaking.
Thou mightest, &c., speak or be speaking.	You might speak or be speaking.
He might, &c., speak or be speaking.	They might speak or be speaking.

Imperfect.

Singular.	*Plural.*
I may have spoken.	We may have spoken.
Thou mayest have spoken.	You may have spoken.
He may have spoken.	They may have spoken.

Pluperfect.

Singular.	*Plural.*
I might have spoken.	We might have spoken.
Thou mightest have spoken.	You might have spoken.
He might have spoken.	They might have spoken.

ADVERBS.

178. Adjectives can be converted into Adverbs by adding *-ly*, as *sweet, sweetly; brave, bravely.* In such words, *-ly* is an abbreviation of *like.*

§. When, however, this *-ly* already exists, no further addition can be made. We cannot derive such a word as *dailily* from *daily.* In *holy* it belongs to the original word; consequently, we *can* say *holi-ly.*

179. *Else*, *unawares*, *eftsoons*, and *needs*, are Adverbs that have arisen out of Possessive Cases. So have *once*, *twice*, and *thrice*, though their present spelling disguises their origin.

§. *Eftsoons* means *soon after*, and is a compound of *soon* and *eft* = *after*. It is used by the older writers like Spenser, and such moderns as imitate them.

Thus—

> *Eftsoons* he fled away, and might no where be seen.
>
> *Faery Queen*, ii. v. 46.
>
> *Eftsoons* his cruel hand Sir Guyon stayed.
>
> *Faery Queen*, ii. v. 13.

§. In such a sentence as *he needs must come when called*, the word *needs* means *of necessity*.

§. The older forms of *once*, *twice*, *thrice*, are *ones*, *twies*, *thries*, wherein the *s* is as truly the sign of a Possessive Case as the *-s* in *father's* or *mother's*. *Hence*, *whence*, and *thence*, are in a similar predicament. The *-ce* represents an original *-es*; the older forms being *hennes*, *whennes*, and *thennes*.

180. *Seldom*, along with the obsolete word *whilom*, is an Adverb that has grown out of a Dative Case, which, in many Anglo-Saxon words, ended in *-um*.

§. *Hvile* in Danish means *rest* or *pause*. In English *meanwhile* means *in the mean time*. In like manner *while* and *whilst* mean *during the time that*. An allied meaning is preserved in the expression *to while (pass) away the time*.

The very first lines of the Faery Queen are—

> Lo; I, the man whose muse *whylom* did maske,
> As time her taught in lowly shepheards weeds,
> Am now enforced, far unfitter taske,
> For trumpets stern to change mine oaten reeds,
> And sing of knights and ladies' gentle deeds.

181. *Darkling* means *in the dark*, and is one of the few Adverbs now remaining which end in *-ling*.

§ In King Lear we read—

> So the candle went out, and we went *darkling*.

If the language contained such a word as *darkle*, meaning to *be in the dark*, this would look like a Present Participle. From this, however, it must be carefully distinguished.

In Scotch these forms in *-ling* are more numerous than with us. In Scotch, for instance, *blindlins* means *blindfold*; *stowlins*, *clandestinely*; *sidelins*, *obliquely*, &c.

182. *Here*, *there*, and *where* were originally the Dative Cases of the Singular Number and the Feminine Gender.

183. *Then* and *when* were originally the Accusative Cases of the Singular Number and the Masculine Gender.

184. *Why* was originally an Instrumental Case.

§. The Nominative Cases of these words were *he*, *this*, and *who*; so that

Here meant *in this place.*
There ,, *in that place.*
Where ,, *in which place.*
Then ,, *at that time.*
When ,, *at what time?*
Why ,, *for what reason?*

It is clear that *hither*, *thither*, and *whither*, are derived from the same roots.

§. *How* can be shown to be an allied form of *why*, which meant *in what manner—for what reason?* The English language, however, conceals the likeness; whilst the Danish and Swedish, where we find the forms *hvi* and *hu*, show it more clearly.

For such expressions as *all the more*, &c., see § 60.

185. The only inflection which Adverbs take is that which expresses the Degrees of Comparison; which are those of the Adjective—*soon*, *soon-er*, *soon-est*; *often*, *often-er*, *often-est*.

There are not many words which do this. We *hear*, indeed, sometimes such expressions as *tightlier*, *quicklier*, *backwarder*, and *tightliest*, *quickliest*, *backwardest*, &c. We rarely, however, find them in writing.

186. *Rather* is the comparative of *rath*, meaning *quick*, *early*, *ready*, *willing*. *I would rather do so and so* means *I would more quickly, or sooner, do*, &c.

Rathe, though obsolete, is still to be found in poetry. Shelley, for instance, speaks of the *rathe primrose;* by which he means *early*. In this case the *a* is sounded as in *fate*.

In *rather*, however, the *a* is sounded as in *father*. Why is this? Can it be that one of the pronunciations is wrong? Such is not the case. In order, however, to see why it is not so, we must go back to the Anglo-Saxon.

The Anglo-Saxon differed from the present English in having two distinct inflections for the degrees of Adjectives and Adverbs. The Adjectives ended in *-re*, and *-est*, as *heard*, *heardre*, *heardest* =

hard, *harder*, and *hardest*. Meanwhile, the Adverbial forms were *-or* and *-ost;* as *heardor*, *heardost* = *hardlier* and *hardliest*.

But this was not all. The vowel *o*, as compared with *e*, is what is called Broad; *e* being Slender. In like manner, the *a* in *father* is also Broad; the *a* in *fate* Slender. In the present English this difference in the Breadth or Slenderness of the vowels is of little importance; of less importance than it is in almost any language on the face of the earth. Elsewhere, however, it commands a great deal of attention. Elsewhere there is a very decided tendency to accommodate the vowel of root to those of the inflection, or *vice versâ;* a tendency which would change the *a* in *fate* to the *a* in *father* whenever such a termination as *-or* or *-ost* became attached.

In Anglo-Saxon this was actually the case. The word *rathe* had two series of degrees.

1. The Adjectival, as *rathe*, *rathre*, and *ratheste;* where the *a* was sounded Slender, and

2. The Adverbial, which ran *rath*, *rather*, *rathost*, where the *a* was Broad, *i.e.* sounded as in *father*.

187. Certain Adjectives may be used as Adverbs. *The sun shines bright; the time flies fast; the snail moves slow.*

These are expressions to which many grammarians object. Doubtless, it is better to say *brightly* and *slowly*. There is one class of words, however, where we have no choice, viz. the Adjectives in *-ly*. It has already been stated that we cannot derive *dailily* from *daily;* in other words, that no such adverb as *dailily* exists. There exist, however, such phrases as *he labours daily; he sleeps nightly; he watches hourly*, and others; in all of which the simple Adjective is used as an Adverb.

But why is this Adverb in the Neuter Gender? Has it not been said already, and will it not be said again, that an English Adjective has neither Gender nor Number, neither Number nor Case —in other words, that it has no inflection at all? If so, how can it be Neuter?

The answer to this involves other questions besides this particular one. Though there are no such things as certain actually existent Cases, Genders, and Numbers in the English of the nineteenth century, there is something extremely like them. There are certain Inflections which may be called *Virtual Hypothetical*. We may, also, if we choose, call them Historical. The name, however, is of less importance than the reality of their existence.

In the present Adjective, for instance, there is no sign of Gender. There was a time, however, when there was one. At that time, all Adjectives used adverbially were in the Neuter

Gender, and no other ; a fact which tells us decidedly and conclusively that *if there were, in the present English, such a thing as a Neuter form*, words like *slow*, *fast*, and *bright*, in the preceding examples, would exhibit it. They did so when the language was Anglo-Saxon. They did so when it was what is called English. They fail to do so now, simply because the sign of Gender has been lost.

As we proceed, a hypothetical or historical Dative Case will claim notice. So will other forms of the same sort.

188. Prepositions, Conjunctions, and Interjections, being wholly destitute of Inflection, will be noticed more fully in the Syntax.

After the notice of Declension and Conjugation, comes that of Derivation and Composition.

Derivation.

Addition of a vowel. *Babe, bab-y.* In Lowland Scotch this is far more common, and is spelt *-ie ;* as *dogg-ie, lass-ie, ladd-ie, mous-ie, wif-ie.*

§. Addition of L.—1. Substantives.—*Gird-le, kern-el.*

2. Adjectives.—*Litt-le, mick-le.*

3. Verbs.—*Spark-le.*

§. Addition of R.—Substantives.—*a.* Words that in A. S. ended in *-er*, and were of the masculine gender—*laugh-t-er, slaugh-t-er.*

b. Words that in A. S. ended in *-er*, and were of the neuter gender—*lay-er, fodd-er.*

c. Words that in A. S. ended in *ere*, and were of the masculine gender. These form a numerous and important class. They are almost all the names of agents. If we subtract from the ending *-er*, the remainder is either a verb or a word that can be used as such.—*Read-er, sinn-er, harp-er, full-er, begg-er* (or *begg-ar*), *hunt-er, lend-er, borrow-er, reap-er, mow-er, sow-er, plough-er, fish-er, deal-er, wander-er, writ-er, lead-er, steer-er, look-er, heal-er, cobbl-er, li-ar, robb-er, sail-or, help-er, los-er, hear-er, buy-er, sell-er, shap-er, leap-er, runn-er, walk-er, jump-er, murder-er, slaughter-er, fiddl-er, giv-er, work-er, rid-er, kill-er, slay-er, slumber-er, sleep-er, keep-er, dream-er, teach-er, tell-er, bak-er, brew-er, thatch-er, weav-er, spinn-er, wait-er, eater, drink-er, din-er, rov-er, lov-er, mov-er, flatter-er, mill-er, glov-er, hatt-er.*

d. Words that in A. S. ended in *-ra*, and were masculine—*gander* (A. S. *gand-ra*).

Verbs.—*Hind-er, low-er.*

§. Addition of N.—Substantives.—*Maid-en, mai-n* (as in *might and main*). That the *-n* is no part of the original word in *mai-n*,

we see from the word *may*. The idea in both *may* and *mai-n* is that of *power*.

Words of this sort express the fact of the object to which they are applied being *made of the material of which* the radical part of the derivative is the name : thus, *gold-en* is a derivative from *gold*, the material of which *golden guineas* are made.—So, also, *oak-en*, *ash-en*, *beech-en*, *braz-en*, *flax-en*, *lead-en*, *silk-en*, *wood-en*, *wooll-en*, *hemp-en*, *wheat-en*, *oat-en*, *wax-en*.

§. Addition of the sound of O, originating in *-ow* or *-ov*, and spelt in the present English *-ow*. By comparison with *shade* and *mead*, the forms *shad-ow* and *mead-ow* are shown to be derivative.

§. Addition of T.—1. Substantives.—*a*. Words which in A. S. ended in *-t*, *gif-t*, *shrif-t*, *thef-t*, *wef-t* (*weave*), *rif-t*, *drif-t*, *thrif-t*, *fros-t* (*freeze*), *grist* (*grind*), *fligh-t*, *sigh-t*, *draugh-t* (*draw*), *weigh-t*.

b. Words which in A. S. ended in *-ta*. The compounds of the word *wright* (from the root *work*, in the old past tense *wrought*) ; such as *cart-wrigh-t*, *wheel-wrigh-t*, *mill-wrigh-t*, &c.

2. Adjectives.—*Tigh-t* (*tie*).

§. Addition of D.—1. Substantives.—*Bran-d* (*burn*, *brenn*, obsolete), *floo-d* (*flow*), *mai-d* (*may* in Lowland Scotch), *see-d* (*sow*), *bur-d-en* (*bear*).

2. Adjectives.—*Col-d* (*cool*).

§. Addition of TH (A. S. þ as sounded in *thin*).—1. Substantives.—*Dea-th*, *bir-th* (*bear*), *heal-th*, *leng-th*, *bread-th*, *heigh-th*, *dep-th*, *mir-th*, *tru-th*, *weal-th*, *fil-th*, *til-th* (*tillage*, or *tilled ground*), *ki-th* (as in the phrase *kith and kin*).

2. Adjectives.—The syllable *-cou-th* in the compound word *un-cou-th*. This word originally means *unknown*, originating in the word *ken* = to *know*.

§. Addition of TH (A. S. ð) as sounded in *thine*.—1. *Bur-th-en* derived from *bear*.

§. Addition of the sound of the Z in *zeal* and the S in *flags* (*flagz*).—Verbs.—*Clean-se* (*clenz*), from *clean*. In A. S. *clæn-s-i-an*.

§. Addition of the sound of K.—*Hill-ock*.

§. Addition of the sound of the vowel E (as in *feet*), originating in *-ig*, and spelt in the present English *-y*.—All the derivative adjectives that now end in *-y*, ended in A. S. in *-ig* ; as *blood-y*, *craft-y*, *drear-y*, *might-y*, *mist-y*, *mood-y*, *merr-y*, *worth-y*, of which the A. S. forms were *blôd-ig*, *cræft-ig*, *dreôr-ig*, *miht-ig*, *mist-ig*, *môd-ig*, *myr-ig*, *worth-ig*.

Addition of the syllable *-ing*.—*Clean-s-ing*, *dawn-ing*, *morn-ing*. In these words the *-ing* was originally *-ung* ; as *clæn-s-ung*, *dag-ung*, A. S.

Addition of the syllable *-l-ing*.—*Gos-l-ing* (*little goose*), *duck-l-ing* (*little duck*), *dar-l-ing* (*little dear*), *hire-l-ing*, *found-l-ing*,

fond-l-ing, *nest-l-ing*, &c. The words of this class are generally diminutives, or words expressive of smallness.

Addition of the syllable *-kin.*—*Lamb-kin* (*little lamb*), *mann-i-kin* (*little man*). Words ending in *-kin* are chiefly diminutives.

Addition of the syllable *-rel.*—*Cock-erel* (*little cock*), *pick-erel* (*little pike*). Diminutives.

Addition of the syllable *-ard.*—*Drunk-ard*, *stink-ard.*

Addition of the syllable *-old.*—*Thresh-old.*

Addition of the syllable *-ern*—*East-ern*, *west-ern*, *north-ern*, *south-ern.*

Addition of the syllable *-ish.*—*Child-ish*, *Engl-ish*, *self-ish*, *whit-ish.* The original form was *-isk ; cild-isc* (*child-ish*), *Engl-isc* (*English*), A. S.

Addition of the syllable *-ness.*—*Good-ness*, *bad-ness*, *wicked-ness*, *bright-ness*, *dark-ness*, *weari-ness*, *dreari-ness*, &c.

Addition of the syllable *-ster.*—*Song-ster*, *pun-ster.* Originally words in *-str-* were limited to the names of females.

Change of sounds.—1. Consonants.—*Price*, *prize ; cloth*, *clothe* ; use*, *use* (pronounced *uze*) ; *grass*, *graze ; grease* (pronounced *greace*), *grease* (pronounced *greaze*). In each of the pairs of words given above, the former is a substantive, and the latter a verb.

2. Vowels.—*Rise*, *raise ; lie*, *lay ; fall*, *fell ; sit*, *set.* The generality of these words are verbs. There are, however, a few nouns, as *top*, *tip ; cat*, *kit.*

The termination *-ry* in words like *rookery*, *fishery*, &c., presents some difficulty. It is clear that the *-r* forms no part of the original word ; for, though there is such a word as *fisher* = *fisherman*, there is no such word as *rooker.* Neither does *fishery* mean a collection of *fishermen*, but one of *fishes.*

Yeomanry and *Jewry*, words of similar origin and meaning. They carry with them the idea of a collection, or assemblage. The words *Englishry*, *Danishry*, and *Welshery* are to be found in old authors. They are, however, at present obsolete.

Eyrie is generally said to mean the nest of an eagle.

> As an eagle, fed with morning,
> Scorns the embattled tempest's warning
> When she seeks her *eyrie*, hanging
> In the mountain cedar's hair,
> And her brood expect the clanging
> Of her wings through the wild air
> Sick with famine.—SHELLEY.

It rather means the *collection of eggs* or *eggery ;* for such is the older form of the word.

What, however, is the *-r ?* In the old Dutch and other allied

* Pronounced *clodhe.*

dialects we find a kind of plural in *-r*. Thus *cealfru = calves ; lambru = lambs ; eggru = eggs.* Indeed, in one word it occurs in provincial and archaic English, viz. *childer = children.* Out of this *-r*, with the addition of the sound of *-y*, has the termination *-ry* in the words above given originated.

In other words, however, this origin is inadmissible ; and the idea of collection or assemblage is either obscure or non-existent. Such are *foolery*, *prudery*, *bravery*, *slavery*, *witchery*, *stitchery* (*needlework*), &c. In all these the *-ry* has originated out of a false analogy.

Composition.

Substantives preceded by Substantives.—*Day-star, morning-star, evening-star, land-slip, watch-house, light-house, rose-tree, oak-tree, fir-tree, harvest-time, goose-grass, sea-man, collar-bone, shoulder-blade, ground-nut, earth-nut, hazel-nut, fire-wood, sun-light, moon-light, star-light, torch-light*, &c.

Substantives preceded by Adjectives.—*Blind-worm, free-man, half-penny, grey-beard, green-sward, white-thorn, black-thorn, mid-day, mid-summer, quick-silver, holy-day*, &c.

Substantives preceded by Verbs.—*Turn-spit, spit-fire, dare-devil, sing-song, turn-coat*, &c.

Substantives preceded by the form in *-ing.—Turning-lathe, saw-ing-mill.*

Adjectives preceded by Substantives.—*Sinful, thankful, blood-red, eye-bright, coal-black, snow-white, nut-brown, heart-whole, ice-cold, foot-sore*, &c.

Adjectives preceded by Adjectives.—*All-mighty, two-fold, many-fold*, &c.

Adjectives preceded by Verbs.—*Stand-still, live-long.*

Verbs preceded by Substantives.—*God-send.* Rare.

Verbs preceded by Adjectives.—*Little-heed, rough-hew.* Rare.

Verbs preceded by Verbs.—*Hear-say.* Rare.

Present Participles preceded by Adjectives.—*All-seeing, all-ruling, soft-flowing, fast-sailing, merry-making.*

Past Participles preceded by Adjectives. — *New-born, free-spoken, fresh-made, new-made, new-laid.*

Present Participles preceded by Substantives.—*Fruit-bearing, music-making.*

Past Participles preceded by Substantives.—*Heaven-born, bed-ridden, blood-stained.*

Verbal Substantives preceded by Substantives.—*Man-eater, woman-eater, kid-napper, horn-blower.*

Verbal Adjectives preceded by Substantives.—*Mop-headed, chicken-hearted.*

Verbal Adjectives preceded by Adjectives.—*Cold-hearted, flaxen-haired, hot-headed, curly-pated.*

§. Adverbs entering into composition are of two sorts:—

1st. Those that can be separated from the word with which they combine, and, nevertheless, appear as independent words; as *over*, *under*, *well*, &c., in *over-do*, *under-go*, *well-beloved*, &c.

2nd. Those that, when they are separated from the verb with which they combine, have no independent existence as separate words; *e. g.* the syllables *be-*, *un-*, *a-*, in *be-hove*, *be-fit*, *be-seem*, *be-lieve*, *be-lie*, *be-spatter*, *be-smear*, *be-get*, *be-labour*, *be-do*, *be-gin*, *be-gird*, *be-hold*, *be-mourn*, *be-reave*, *be-deck*, *be-think*, *be-mire*, *be-rhyme*, *un-bind*, *un-do*, *un-loose*, *un-lock*, *un-wind*, *a-light*, *a-rouse*, *a-rise*, *a-wake*, *a-wak-en*, *a-bet*, *a-bide*.

SYNTAX.

189. Syntax treats of the arrangement of words, and the principles upon which they are put together, so as to form sentences. It deals with groups or combinations of words; in this respect differing from Etymology, which deals with individual words only.

The notice of the Compounds of a language leads from Etymology to Syntax; for it is clear that in expressions like *hot-headed*, *horn-blower*, and the remainder of the preceding series, we have something more than an individual word, and, consequently, something which, in some sense, belongs to Syntax. We have *two* words at least. In some cases (as in *gentlemanlike*, *midshipman*, &c.) we have *three*. We also have them in a state of combination. The combination, however, constitutes but a single word.

It is not always an easy matter to distinguish between two separate words and a Compound; a fact which has already been suggested. A crow is a *black bird*. It is not, however, a *blackbird*. The best criterion is the accent.

When the two words are equally accented, the result is a pair of separate words, connected with one another, according to the rules of Syntax—*the crow is a bláck bírd*.

When the two words are *un*equally accented, the result is a Compound—as *the bláckbird is akin to the thrush*.

190. *Construction* and *Syntax* have much the same meaning. We speak of the rules of *Syntax*, and of the *Construction* of sentences.

§. The Syntax of a language is always regulated by its Etymology; so that in those languages where the signs of Gender, Number, Case, Person, Tense, and Mood are numerous, the rules of Syntax are also numerous. On the other hand, where the Etymology is simple, the Syntax is of moderate dimensions.

In English, as has been seen, our Etymological forms are few. There were, for instance, but few Cases, and there were but few distinctions of Gender. The Adjective was remarkably wanting in forms: yet it is a part of speech which, in many languages, has, at least, two Genders—often three. In French, for instance, we say *le bon père = the good father;* but *la bonne mère = the good mother.* In Latin *bonus pater = good father; bona mater = good mother; bonum telum = good weapon.* Meanwhile, the Plural runs *boni patres, bonæ matres, bona tela.* The Frenchman who said *bon mère* or *bonne père* might be accused of making a false Concord; inasmuch as he would join an Adjective in one Gender to a Substantive in another. No Englishman can possibly commit an error of this kind; because, in the word *good* there is no change at all, and, because, in English we say *good father, good mother, good thing, good fathers, good mothers,* and *good things* indifferently.

§. The same applies to the Articles. In French there are the forms *un* and *une = a* (or *an*); along with *le, la, les,* meaning *the.* Meanwhile, the German says *der, die, das,* and *einer, eine, eines,* where the Englishman says simply *the,* and *a* (or *an*). Of course, then, the rules for the Syntax of the Article must be simpler in English than in German.

§. On the other hand, English Syntax has certain decided peculiarities—peculiarities which require to be thoroughly understood, in order that certain difficulties and ambiguities may be avoided.

In languages where each part of speech has its own peculiar and characteristic termination it is scarcely possible to confound a Substantive with a Verb or a Verb with a Substantive. In English, however, where these distinctive signs are rare, it is, by no means easy, in all cases, to separate them. Take, for instance, the word *black.* It is, doubtless, in its origin, adjectival; and if we ask what it is as a part of speech the answer is that "it is an Adjective." As such, we can give it the degrees of Comparison, and say (for instance) *this ink is black, this is blacker, but that is the blackest of all.* But what when we use such an expression as the *blacks of Africa* or the *blacks are falling,* where there is the sign of the plural number; a phenomenon wholly unknown to the English Adjective? Surely, we must say that *black* means *black man,* or *black thing,* and that the word is no longer an Adjective but a Substantive.

But this is not all. The word may be used as a Verb and a Participle, and the man who has *had his shoes blacked* may say that *the little boy at the corner of the street blacked them.*

More will be said upon this point when the Adverbs, Prepositions, and Conjunctions, come under notice. At present, it is enough to state that words like *black* are what is called *Convertible;* and that, owing to its want of distinctive inflections, there is a great deal of convertibility in the English language.

191. In Etymology we *Decline* and *Conjugate;* in Syntax we *Parse.*

192. Parsing is of two kinds; Logical and Etymological.

193. Logical Parsing gives the analysis of sentences according to their Terms and Copulas, telling us which is the Subject and which the Predicate, which the chief and which the secondary, parts of each.

194. Etymological Parsing gives the analysis of sentences according to the Parts of Speech of which they are composed. It tells us which is the Noun, which the Verb. It separates Adjectives from Substantives, Pronouns from Adverbs, and the like. It deals with Numbers, Cases, Persons, &c.

195. The two most important terms in Syntax are Concord and Regimen, the first of which means Agreement, the latter Government.

196. When the Gender, Number, Case, or Person of the two connected words is the same, we have a Concord, and one word agrees with another.

There is also a Concord of Mood and Tense; though, of this, little notice is taken. It is clear, however, that when we say *I* do *this that I* may *gain by it,* we preserve a Concord; and that in saying either *I* do *this that I* might *gain by it,* or, *I* did *this that I* may *gain by it,* we break one.

197. When two connected words are in different Cases, we have a Regimen, and one word governs another.

§. A little consideration will teach that, in most cases, the laws of Syntax are neither more nor less than the dictates of common sense applied to language, and that, in many cases, the ordinary rules are superfluous. This applies most especially to the Concords, or Agreements. No one, who speaks English, need be told that in speaking of a man we say *he;* a woman, *she;* an inanimate object, *it.* In doing this we suit the Pronoun to the Substantive, and use

a masculine, a feminine, or a neuter form accordingly. Consequently, the words seem to agree with one another. It would, however, be strange if they did not. The word *man* is the name of a male. The pronoun *he* is the same. They are applied to the same object.

Again,—if certain Pronouns, such as *they*, apply only to a number of individuals, and never to a single person, and if such a verb as *calls* applies to a single individual only, and never to a number, it requires no great amount of ingenuity to discover that such an expression as *they calls* is nonsensical. *They* denotes a multitude; *calls* a single individual. How can the two be united?

It is, of course, useful to know that the first of these instances gives what the grammarians call a Concord of Gender; the second a Concord of Number. Common sense, however, lies at the bottom of both. A Substantive and a Pronoun which each denote an object of the same sex cannot fail to be in the same Gender, and, because they are this, they are said to agree with one another. In like manner a Pronoun and a Verb, when each means the same person or the same number of persons, exhibit the Concords of Person and Number.

§. The Concord of Case is somewhat less simple; neither are the phenomena of Regimen, or Government, on the whole, so clear as those of Concord. Enough, however, has been said to direct attention and to stimulate curiosity.

§. Though Syntax is, in the main, neither more nor less than common sense, there are certain facts of language which always suffice to render a special study of its rules a matter of necessity. These can no more be neglected than the phenomena of friction in mechanics. A few of them will be noticed.

1. Sometimes there is a compendious mode of expression; and two Singulars make a Plural. We say *the sun shines* and *the moon shines*. But we also say *the sun and moon shine*. This, however, will be made clearer as we proceed.

2. Sometimes we have words which are called *Collectives*. In these the form is Singular, but the sense is Plural. An *army*, for instance, consists of a number of soldiers, and the act of an army is in some sense the act of numerous individuals rather than of one collective body. The same applies to words like *parliament*, *family*, *people*, *mob*, *set*, *gang*, *&c.* Hence, even good writers have uttered such expressions as *the multitude pursue pleasure*. No doubt such expressions are justifiable. It is, perhaps, better to write thus than to say *the multitude pursues*, *&c.* At the same time it would be wrong to say *the meeting were large*.

As all Collectives give at once the ideas of *unity* and of *plurality*, consider, when you determine whether to use the *singular* or the *plural* form of the *Verb*, which of the two ideas you wish to bring into prominence.

I have not travelled this twenty years.—Here we do not think of

twenty years taken separately, but of *a single period.* The sense is singular, and we use the singular pronoun *this.*

These sort of people.—Here the word *sort* implies the existence of more persons than one, and therefore is taken as plural in sense.

3. Sometimes the Etymology is doubtful. The letter *-s* is the sign of the Plural Number. But certain Singulars end in *-s* also. It is clear that those may be mistaken for Plurals. So high an authority as Pope writes—

Riches, like insects, when conceal'd *they lie*,
Wait but for wings, and in *their* season fly.

Riches, however, which is neither more nor less than the French *richesse*, is a Singular form.

In like manner *alms* is from the Anglo-Saxon *almesse*, wherein the *-s* is part of the original word, and no sign of Number at all.

§. As the habit of treating Collectives as Plurals interferes with the Concord of Number, the practice of Personification traverses the rules for the Concord of Gender. We Personify an object when we speak of inanimate things as if they were persons.

Examples.

Gold, whose touch seductive leads to crime.
Death reaps his harvest.
Vice is the *parent* of misery.
The *cities who* aspire to liberty.

198. Some sentences consist of a single proposition, as—*the sun shines;* others, of two propositions combined, as—*the sun shines, and, therefore, the day will be fine.*

§. This is made plainer by writing the words thus—

The sun shines,
and therefore
The day will be fine.

199. The Syntax of Single Propositions, being the simplest, comes first under notice.

200. As the Pronouns had the fuller inflection, they preceded both the Substantive and the Adjective when we treated of their Etymology. For the same reason they come first in Syntax.

201. Whether we say *feed the horse* or the *horse feeds* is indifferent; inasmuch as, in *Substantives* like

horse, there is no difference between the Objective and Nominative.

202. Whether we say *a good book* or *good books* is indifferent; inasmuch as, in *Adjectives* like *good*, there is no difference between the Plural and the Singular.

203. Whether we say *feed he* or *feed him* is by no means indifferent; inasmuch as, in *Pronouns* like *he*, &c., the Objective and the Nominative differ.

204. Whether we say *this books* or *these books* is by no means indifferent, inasmuch, as in *Pronouns* like *this*, &c., the Plural and the Singular differ.

205. *His* and *her* are Personal Pronouns in the Possessive Case rather than true Possessive Pronouns. If it were not so, such expressions as *his mother* and *her father* would be ungrammatical.

The classical scholar understands this difference at once. *His* and *her* are the equivalents to *ejus* rather than *suus*.

206. The Pronoun of the Second Person Singular is only used in solemn discourse, and by the members of the Society of Friends. Instead of *thou*, we say *you*.

207. With *my*, *thy*, *our*, *your*, *her*, and *their*, the Substantive is expressed; as *this is my hat*. We cannot say *this hat is my*.

208. With *mine*, *thine*, *ours*, *yours*, *hers*, and *theirs*, the Substantive is understood, as—*this hat is mine*. This would be, in full, *this hat is my hat*.

209. *His* and *its*, on the contrary, can be used either in union with the Substantive or without it—*this is his hat; this is its home.—This hat is his; this home is its*.

210. In expressions like *they say*, &c., *they* means

the world at large or *people in general.* This is the Indeterminate use of the Pronoun.

211. *One says* is also an Indeterminate expression, wherein *one* is not the Numeral but the French word *on* in *on dit.*

212. *It* is also indeterminate. It stands for an unexpressed, but understood, *Subject.*

213. Closely connected with the indeterminate sense of *it* is that of *there*, in such expressions as *there is something wrong—there is no one here—there are thieves in the house.* In such expressions *there* stands for an unexpressed, but understood, *Predicate.*

The Indeterminate Pronouns are admirably illustrated by researches into the history of the language. The word *one* in the expression *one says* has nothing to do with the numeral *one.* The numeral *one* was, in Anglo-Saxon, *áne*, and in Latin *unus.*

The Indeterminate *one* had no existence in Anglo-Saxon at all; and was foreign to the soil of England until the battle of Hastings. Hence, common as it is, it is of French origin. The older forms in French were *om* and *homme*, which are neither more nor less than the Latin *homo* = *man.* So that *one says* = *man says* or *men say.*

Now this is what our Anglo-Saxon ancestors actually said. Before *on* was introduced from France we said *man*, or *men.* At the present time the German for *one says* (*on dit*) is *man sagt.*

In such phrases as *it rains, it snows, it freezes*, it would be hard to say, in express terms, what *it* stands for. Suppose we are asked *what rains? what snows? what freezes?*—the answer is difficult. We might say *the rain, the weather, the sky*, or what not? Yet, none of these answers are satisfactory. To say the *rain rains, the sky rains*, &c., sounds strange. Yet we all know the meaning of the expression—obscure as it may be in its details. We all know that the word *it* is essential to the sentence; and that if we omitted it and simply said *rains* the grammar would be faulty. We also know that it is the Subject of the proposition—a point of knowledge which is of great importance.

The following extract from an old grammar illustrates this difficulty. The word *Deus* (*God*) was held to be the Subject in such indeterminate expressions as the ones just under notice.

Pluit,	raynes	Deus meus.
Gelat,	freses	,, tuus.
Degelat,	thowes	,, suus.

Ningit,	snawes	Deus ipsius.
Tonat,	thoneres	,, sanctus.
Grandinat,	hayles	,, omnipotens.
Fulgurat,	lownes	,, creator.
Fulminat,	*idem,*	,, dat omnia.

§. Just as *it*, when it begins a proposition, is a Subject, so is *there* a Predicate. It is a Predicate, however, which *begins* the Proposition in which it occurs, and, so doing, looks like a Subject. In this lies its Indeterminate character. If I say *something wrong is there*, or (*thieves are there*) the person to whom I speak imagines that I know the place where the *wrong* or the *thieves* are to be found. This is because I use the word *there* in a determinate sense. If, however, I say *there is something wrong*, or *there are thieves in the house*, I imply, that, though I know of mischief, and though I know of robbery, I do *not* exactly know the point where they are to be discovered. This is because *there* is Indeterminate.

Nevertheless, it is the Predicate of the proposition : the word which follows the verb being the Subject.

214 In Indeterminate sentences beginning with *it* the verb is Singular.

215. In Indeterminate sentences beginning with *there* the verb is either Singular or Plural as the case may be. It is Singular when the noun which follows it is Singular, and it is Plural when it is Plural. We say

There *is* something wrong.
There *are* thieves.

216. *An* is called the Indefinite Article, because it specifies no object in particular. It is only used before words beginning with a vowel. Before a consonant, a semivowel, or *-h*, it loses the *-n* and becomes *a;* as *an ant, an egg,—a man, a pan.*

§. Amongst the curiosities of language we may reckon the words *adder, nag, newt,* and a few others. The German for *adder* is *natter*, the Danish for *nag* is *ög. Newt* is the same word as *eft.* In all these, there has been a confusion between the final *-n* of the Article, and the initial of the Substantive ; so that, whilst *a nadder* has been divided as if it were *an adder, an ag* has been divided as if it were *a nag.* In an old vocabulary for the use of boys learning Latin the following misdivisions occur. Unlike, however, the words just noticed, they have failed to become permanent.

Hec auris	a *n*ere	*i.e.*	an ear.
hec aquila	a *n*eggle	,,	an eagle.
hec anguilla	a *n*ele	,,	an eel.
hec erinaceus	a *n*urchon	,,	an urchin.
hic comes	a *n*erle	,,	an earl.
hic senior	a *n*ald man	,,	an old man.
hic exul	a *n*owtlay	,,	an outlaw.
hic lutricius	a *n*otyre	,,	an otter.
hec alba	a *n*awbe	,,	an aube.
hec amictus	a *n*amyt	,,	an amice.
hec securis	a *n*ax	,,	an axe.
hec axis	a *n*axyltre	,,	an axletre.
hec ancora	a *n*ankyre	,,	an anchor.

217. When two or more Substantives come together meaning different things, the Article stands before each. When the offices are separate, we say, *the secretary and the treasurer*.

218. When two or more Substantives come together meaning the same thing, the Article stands before the first only. When the two offices are held by the same person, we say, *the secretary and treasurer*.

219. In a few instances the simple Personal is used instead of the Reflective Pronoun, *i. e.* we say *him* instead of *himself*—

> He sat *him* down at a pillar's base.—BYRON.

See § 75.

220. In *myself*, *thyself*, *ourselves*, and *yourselves*, the construction is that of an ordinary Substantive preceded by a Possessive case. *Myself* means *my personality*, *individuality*.

When any word comes between the personal pronoun and *self*, the personal pronoun is always in the Possessive case, as *my own self*, *our own selves*, *his own self*, *its own self*, *their own selves*.

This separation is rare.

> —I call *mine own self* wild,
> But keep a touch of sweet civility
> Here in the heart of waste and wilderness.
> *Tennyson's Idylls of the King Enid.*

221. In *himself* and *themselves* the construction varies with the case.

222. When *himself* and *themselves* are in the nominative case they may be looked upon as improper compounds; and treated as single words. *He himself is coming—they themselves are here.*

223. When *himself* and *themselves* are in the accusative case they must be looked upon as instances of apposition. *He hurries himself—they busy themselves.*

224. In *herself* the construction is ambiguous. We cannot say whether the first syllable is Possessive or Objective.

225. In *itself* the construction is also ambiguous. We cannot say whether the original form was *it-self* or *its-self*.

§. The construction of the word *self* deserves attention both on account of its complexity, and on account of its history. In the first place, it is one of those words which are dealt with more correctly in the language of the uneducated classes than in the language of literature. In the provincial dialects they are used rightly ; in books wrongly. Many an individual has been laughed at for saying *his-self* and *their-selves*, instead of *him-self* and *them-selves ;* and that by speakers who would be shocked at hearing *me-self*, or *thee-self*, instead of *myself*, or *thyself*. In strict grammar, however, *his-self* and *their-selves* are right.

For the purposes of grammar *self* is a Substantive ; and, after the manner of Substantives should it be treated. It means *personality*, or *individuality*, and should enter into the structure of sentences accordingly. Like an ordinary Substantive, it has a plural number, and we say *myself* and *ourselves* just as we say *my personality*, or *our individualities*. Such being the case expressions like *himself* and *themselves* are as objectionable as *him personality*, or *them individualities*. Custom, however, has given currency to an inconsistent use of the word.

226. The numeral *one* is naturally singular. All the others are naturally plural.

227. The numeral *one* is naturally singular. So is the Indefinite Article *an* (or *a*). At the same time

we say *a hundred*, *a thousand*, and the like; the words *hundred* and *thousand* being collective.

228. The Noun with which a Plural Numeral is joined is often in the singular number. Many say *twenty pound* instead of *twenty pounds*.

229. The *first two* is by no means the same as the *two first*. The *two first boys of their class* are the captains of two different classes. The *first two boys* are the captain and second of the same class.

230. The Possessive Case implies ownership—*John's picture* means the *picture* which is *owned by John*. *A picture of John* means a *picture in which John is represented*.

231. One Possessive Case may be followed by another, as—*the man's father's hat*.

232. Possessive Cases precede their Substantive. We say *the man's hat*, *the king's army*, *the queen's crown* —not *the hat man's*, &c.

233. In the names of a few well-known objects the Possessive Case can stand by itself; as *St. Paul's*, *St. Bride's*, *Rundell and Bridge's*, &c. Here the words *Cathedral*, *Church*, *Shop*, or the like, are understood.

234. When two Substantives meaning different things come together they are said to be in a state of Government, and when two Substantives are in a state of Government their cases are different,—*England's king*, *George's crown*.

235. When two Substantives come together, referring to one and the same thing, they are said to be in Apposition,—and, then, there are three things to observe concerning them.

1. They must agree in case. In *George*, *King of England*, *began to reign*, *George*, and *King of England* are both Nominatives.

2. They must express the same thing. *George* and *King of England*, apply to the same monarch.

3. They must explain each other. *King of England* explains *what George* we mean, and the expression *George* explains *what King of England* we mean.

Similarly—*Solomon, the son of David; Crœsus, King of Lydia; London, the capital of England; Contentment, parent of delight.*

§. Apposition is closely akin to Concord; indeed, it may be called a kind of Concord.

236. As Adjectives have neither Case nor Number, nor yet Gender, their Syntax is simple. It chiefly refers to the degrees of Comparison.

237. The Adjective generally precedes the Substantive; as a *good man*, not a *man good.* In many other languages the order is reversed. Even in English we may use such expressions as *a man just and good, a woman wise and fair, a hero devoted to his country.*

238. When two objects are compared, the Comparative, when more than two, the Superlative Degree, should be used—*this is the better of the two, but this is the best of all.*

239. The Positive preceded by the word *more* may stand instead of the Comparative. We may say *more wise* instead of *wiser.*

240. The Positive preceded by the word *most* may stand instead of the Superlative. We may say *most wise* instead of *wisest.*

241. Sometimes both signs may be used, as—*the more serener spirit—the most straitest sect.*

§. These latter combinations are good instances of Pleonasm. Those like *more wise* and *most wise* require a further notice.

That they can be used is universally known. Neither is there anything remarkable in their syntax. Common sense tells us what

they mean. When, however, do we use the one form, when the other? This depends upon the nature of the Adjective. In general terms, we may say that the object of the circumlocution is to keep the length of the word within certain limits. It is, *probably*, better to say *more fruitful* than *fruitfuller*. It is *certainly* better to say *more pusillanimous* than *pusillanimouser*. But it is doubtful whether this is the only rule to go by. A great many Adjectives (*fruitful* amongst the number) are Compounds, in which case the addition of an *extra* syllable presents an accumulation of subordinate parts, which, to some speakers, may be inconvenient or disagreeable. Thirdly, there is a large number of Adjectives which are of foreign origin. To some of these an English affix like *-er* or *-est* would be exceptionable.

Thus much, however, may safely be said—

1. That when the word is, at one and the same time, monosyllabic and English in origin, the forms in *-er* and *-est* are preferable.

2. That when the word is trisyllabic, compound, and of foreign origin, the combinations in *more* and *most* are to be resorted to.

For intermediate cases the writer may consult his own taste. Of dissyllables, the words that end in *-y* are those that, next to our native monosyllables, have the best claim to be inflected—as *holy, holier, holiest—manly, manlier, manliest;* upon which we may remark, by the way, that they are all Anglo-Saxon.

In these *y* is changed into *-i-* just as it was in the plural of Substantives like *quantity* (*quantities*) and the preterite of Verbs like *cry* (*cried*).

242. The word *like* governs an Objective Case, as—*this is like him*, and it is the only adjective that does so.

§. We now pass from the consideration of the Adjective to that of the Participle; an important and interesting Part of Speech, inasmuch as it forms the transition from the great class of Nouns to the great class of Verbs. Before, however, we treat of the details of its Syntax we must guard against the very common error of supposing that all words which end in *-ing* are Participles. In expressions like *seeing is believing*, and many others, the forms in *-ing* are no Participles but Substantives, as may be seen in the remarks on § 121.

243. The Syntax of the Participle is, to some extent, the Syntax of the Adjective. We may say *I am tired*, or *he is weeping*, just as we may say *I am weary*, or *he is sad*.

244. A Participle, like an Adjective, can form the Predicate, but not the Subject, of a Proposition; as *I am writing*, *he is speaking*, *the dog is barking*.

245. A Participle, like an Adjective, is wholly destitute of *actual* inflection. We say *I am*, *thou art*, *he is*, *she is*, *it is*, *we are*, *ye are*, *they are—speaking*. We also say *I heard him*, *her*, *it*, or *them—speaking*.

246. A Participle, however, like an Adjective, must be considered in respect to its *virtual* Cases, *virtual* Numbers, and *virtual* Genders. (See § 187.)

247. The Past Participle combines with both *am* and *have*, as *I am called*, *I have spoken*.

248. The Present Participle combines with *am*, but not with *have*. We say *I am calling*. No one says *I have coming*.

Such a phrase as *I have been calling* is no exception to the rule: inasmuch as *been* is the word which unites to *have*, whilst *calling* depends upon *been*.

249. Combined with *am*, *art*, &c., the Participle is in the same Case with the Noun.

250. Combined with *have*, the Participle is in the Accusative Case and the Neuter Gender.

This occurs in phrases like *I have spoken*, *I have slept*, *I have moved*, *I have written*; where *have* is in the present tense, and where *spoken*, *slept*, *moved*, *written*, are past passive participles. The phrases *I had spoken*, *I had moved*, &c., are in the same predicament, except that there *had* is in the past tense. *I had been moved*, *I shall have struck*, are modifications of the same construction, the phrase being somewhat more complex. Now, in all the phrases quoted above, the word *have* has the same power. It indicates *past time*, *although it be itself in the present tense*.

As the natural meaning of the word *have* denotes *possession*, it may naturally be asked how it comes to mean *past time*. The difficulty that here arises becomes more visible, if we substitute for the word *have* some word of similar meaning, such as *hold*, *possess*, or *own*. To say *I own written a letter*, *I possess written a letter*, *I hold written a letter*, sounds as nonsense; at any rate, it gives no such a meaning as is given by the words *I have written a letter*. A little consideration, however, will show how the power

of expressing *past time* may arise out of the idea of *possession*. In the first place, it is very evident, that, in order for a person to possess an object, the object must be in existence. We cannot say that a man *has a written letter*, without also implying that *a letter has been written*. Hence the idea expressed by the words *I have a written letter*, or *I have a letter written*, is allied to the idea expressed by *I have written a letter*.

The proofs that the view above is the true one are as follows :—

1. In certain other languages we find other words besides *have*, expressive of possession, used for the sake of denoting past time ; *e. g.* in Spanish the word *tengo* = *I hold*, and in Old High-German and Old Saxon the word *eigan* = *to own*. In these tongues, phrases like *I hold ridden*, *I own ridden* = *I have ridden*, are actually existing.

2. In Old High-German, Old Saxon, and Anglo-Saxon, we have the order of the participle and substantive occasionally reversed ; *e. g.* instead of saying *I have forgotten it*, *I have chosen him*, *I have made one ;* the phrases ran, *I have it forgotten* (i. e. *I possess it as a forgotten thing*), *I have him chosen* (i. e. *I possess him as a chosen person*), *I have one made* (i. e. *I have one as a made thing*).

3. That in languages where there is a sufficient amount of inflection to exhibit the participle as agreeing in case, number, and gender with the substantive to which it applies, such agreement is exhibited. In Latin we find expressions like *literam scriptam habeo* = *I have, as a thing written, a letter*, or *I have written a letter*.

Respecting expressions like the one in question, there is yet one point to be explained. This concerns the gender.

In the two sentences, *I have ridden a horse*, and *I have ridden a mare*, the word *ridden* is in the same gender, although *horse* is masculine, and *mare* is feminine. Moreover, the word *ridden* is in the *neuter* gender, and, as such, equally different in gender from the two substantives *horse* and *mare*. This is the case not only with the sentences in question, but with all others like them. Whatever may be the gender of the substantive, the participle that follows the word *have* is always *neuter*.

Apparently this violates the statement made above, *viz.* that the participle agreed with the noun in case, number, and *gender*. In reality it does not violate it. All sentences like the one in question are elliptical, the word *thing* being understood ; so that

I have written a letter is equivalent to *I possess a letter as a written thing*. *I have ridden a horse* is equivalent to *I possess a horse as a ridden thing*. *I have ridden a mare* is equivalent to *I possess a mare as a ridden thing*.

Hence it is not with the substantive that appears in the sentence ; but with the substantive *thing* understood that the participle agrees. Doing this, it is neuter.

251. Participles denote actions rather than qualities. *I am tired* is different from *I am weary*. *The sun is shining* is different from *the sun is bright*.

252. Every Participle is derived from a corresponding Verb, as *tiring* from *tire*, *shining* from *shine*.

253. A Participle, like a Verb, can govern a Case. We say *I am calling him*, just as we say *I call him*.

254. Hence, the Syntax of Participles is, to some extent, the Syntax of the Verb. We may say *I call* as well as *I am calling*.

255. In respect to its Concords the Participle is an Adjective: in respect to its Government a Verb.

256. When a Participle is more of a Verb than an Adjective it *follows* its Substantive, as—*I am thinking*, *I saw a vessel sailing*.

257. When a Participle is more of an Adjective than a Verb it *precedes* its Substantive, as—*a thinking man*, *a sailing vessel*.

258. Participles, when used as Adjectives, can be preceded by the words *very*, *more*, and *most*, *less* and *least*; as *a very loving couple*; *a more shining light*; *a most thinking man*.

§. The Participle leads from the *Adjective* to the Verb; and, as the Adjective is a Noun, it is clear that the difference between Nouns and Verbs is by no means very decided. They pass into one another through the Participle. In order to prepare for this a special reference has been made to that part of Etymology which treats of the Participial inflection.

It is now necessary to turn our eyes in another direction, and to take notice of another path, or line, by which the Verb graduates into the Noun through the *Substantive*. And here it is the Infinitive Mood which plays the most conspicuous part in the transition. To prepare ourselves for this we must again go over old ground; and refer to §§ 120–125, and the commentary upon them.

259. A Verb is a word which can form both the

Predicate and the Copula of a Proposition: as *Fire burns.*

260. Every Verb has its corresponding Participle. From *come*, *plant*, *write*, we get *coming*, *planted*, *written.*

261. As the Participle, in respect to its inflection, agrees with the Adjective, and as the Infinitive Verb agrees with the Substantive, Verbs are susceptible of Declension.

262. So far as the Verb is related to the Noun, it is Declined. So far as it is characterized by peculiarities of its own, it is Conjugated.

263. Verbs must be considered in respect to *Mood*, *Tense*, *Person*, and *Number.*

When two verbs come together (as *I can go*, *I wish to see*) there is a question of Mood. Whenever two Propositions are connected by means of a Conjunction, Mood comes under notice.

When we say *John walks*, we state something as a fact. We say positively that the action of walking is going on.

When we say *John! walk!* we give orders for something to take place; *viz.* the action of walking. We do not say that the action of walking is positively taking place, or going to take place. We only deliver an order that it should do so.

When we say *if John walk fast, he will fatigue himself*, we use the word *walk* in a third sense. We do not say that the action of walking is taking place, or has taken place, or will take place. Neither do we deliver an order that it may take place. We say, however, that *if* it do take place, something else will take place also; *viz.* that the person who causes it to take place will fatigue himself. Now in this case there is the idea of conditions and contingencies. John's fatigue is contingent upon his walking fast.

In *John begins to walk*, the word *walk* is in a different sense from any of the preceding; for it depends neither upon John, nor upon any word like *if*. It depends upon *begins.*

In *John walks*, the word *walks* is in the *Indicative* Mood.

In *John! walk!* the word *walk* is in the *Imperative* Mood. The word Imperative is derived from the Latin word *impero* = *I command.*

In *if John walk fast, he will fatigue himself*, the word *walk* is in the *Conjunctive* Mood. In this case there is *conjoined* with the

proposition in question another proposition. *He will fatigue himself* is one proposition ; *John walks fast* is another. The word *if* connects the two, and this connection changes the mood of the word *walks ;* which becomes *walk.* From this fact the mood is called Conjunctive ; from the Latin word *conjungo = I conjoin*, or *join together.*

In *John begins to walk*, the verb *walk* merely states what the action is that *John begins to perform.*

And this is an action without a *direct* agent. That *to walk* is connected with *John* is true. The connection, however, is anything but direct. It is also true that the person who *begins to walk* is a *walker*, or *one who walks.* This, however, is an accident. In such expressions as *John refuses to walk*, or *John ceases to walk*, there is no *walking* at all. All that John does is *to refuse*, or *to cease* to do something ; and it is upon the Verbs *refuse* or *cease*, and not upon the Substantive *John* that the Infinitive *to walk* depends.

How slight, however, is the difference between *refusing to walk* and *refusing the action of walking.* Slighter still is the difference between *he begins to move, he begins a movement, he begins motion.* Equally slight is the difference between a Verb in the Infinitive Mood and a Noun.

The little that need be said about the Syntax of the Indicative Mood is involved in our remarks upon the Tenses, Numbers, and Person. As a *Mood* its Syntax is simple.

The construction of the Conjunctive belongs to a later part of the book, *i. e.* the part which treats of Complex Propositions.

The Imperative and Infinitive require notice.

264. The Imperative can only be used in the second Person. It applies to the person spoken to, and to him only.

265. It can be used in both Numbers ; inasmuch as we can speak to either one individual or more than one.

266. It can, as has been already stated, dispense with the Pronoun. We can say *walk*, *stop*, *speak*, &c. But it can also be accompanied by one.

267. When an Imperative is accompanied by its Pronoun, the Pronoun, instead of preceding the Verb, *follows* it. We say *walk thou ; speak thou ;* rather than *thou walk, thou speak.*

268. Negative Imperatives are generally expressed by the auxiliar *do*. We say *do not hurry*, more frequently than *hurry not*.

269. Imperatives which imply permission are generally expressed by the auxiliar *let;* as, *let us go*.

§. In both these cases the chief Verb is in the Infinitive Mood. Meanwhile, *let*, like any other Transitive Verb, governs its Noun (*us*) in the Objective Case. By some grammarians *let* has been called a sign of the Imperative Mood. It has, however, been stated in the Etymology that the English Imperative has *no signs*. But as the phrase *let us go* would in Latin be expressed by a single word (*eamus*), *let* is not improperly looked upon as an auxiliar.

§. The use of the words *you* and *ye* may now be noticed. They occur in conjunction with other Moods besides the Imperative. They occur, however, oftener with Imperatives than aught else. However much we may be told in the Etymological part of our grammars that *ye* is in the Nominative and *you* in the Objective Case, and however much the theoretical views of the English language may favour this view, it is clear that there is a great deal of confusion between the two. Dr. Guest has well remarked that at one time the two forms were nearly changing place; in proof of which he gives the following examples:

> As I have made *ye* one, lords, one remain;
> So I grow stronger *you* more honour gain.
>
> *Henry VIII.* iv, 2.

> What gain *you* by forbidding it to teaze *ye?*
> It now can neither trouble you nor please *ye.*
>
> *Dryden.*

Nor is this all. *Ye* may not only be either Objective or Nominative, but it may (as stated in § 219) stand for *yourselves;* so that in many expressions the construction is ambiguous. *Mount ye* may mean either *be ye mounted*, or *mount yourselves.*

§. In *IIenry IV.*, Falstaff says to the Prince of Wales, "Rob *me* the exchequer, Hal." Here *me* is a kind of Dative, and means *for me*, or, *at my request.*

270. When two verbs come together, the latter is in the Infinitive Mood; the usual construction being Gerundial; *i. e.* with the Preposition *to*.

§. A few words only dispense with the Preposition *to*; *e. g.* we say:—

I may go,	*not*	I may *to* go.
I might go,	,,	I might *to* go.
I can move,	,,	I can *to* move.
I could move,	,,	I could *to* move.
I will speak,	,,	I will *to* speak.
I shall wait,	,,	I shall *to* wait.
I should wait,	,,	I should *to* wait.
Let me go,	,,	Let me *to* go.
He let me go,	,,	He let me *to* go.
I do speak,	,,	I do *to* speak.
I did speak,	,,	I did *to* speak.
I dare go,	,,	I dare *to* go.
I durst go,	,,	I durst *to* go.

271. Verbs express actions. Different actions take place at different times. One action, for instance, may be taking place at the Present moment; another may be Past; a third may be Future.

272. In Syntax we talk of Time; in Etymology of Tenses. It is not every Time that has a Tense to match.

273. To denote an action actually Present, we use the Present Participle preceded by *am*, *art*, *is*, &c. *I am speaking as you are entering.*

§. This shows that, in the case of the *Present* Tense, at least, the name by no means accurately coincides with its meaning; a fact to which the attention of the student is most especially invited. When a person says that *he sleeps well*, the chances are that he is wide awake at the very time he makes the announcement. When he says—*I dine at one and sup at nine*, he cannot be taking both meals at once. That the *sun rises every morning* may be said either at noon or at midnight. What, then, does the present denote? It denotes habits, and, if it were not the novelty of the expression, might be called the habitual tense. To say that *a man rides well* is to say that he is a good rider. To say that *I dine at one* means that a dinner at that hour is my usual custom.

At the same time, habitual actions are more or less present; at any rate they are neither wholly future nor wholly past. The good rider has already ridden, and will, probably, ride again. The man who dines at one has already dined at that hour. He also means to dine at the same hour again. Habitual actions, then,

are to some extent present actions as well. They have begun, but have not ended.

274. To denote an action which took place in past time, but which was interrupted, we use the Present Participle preceded by *was*, *were*, &c. *I was speaking when he entered.*

In *I was speaking when he entered*, there is a mixture of Past time with the Present. The *act of speaking* and the *entrance of* the person who interrupted it may have taken place 1000 years ago. Hence, both *was* and *entered* are Past tenses. Nevertheless, the *speaking* and the *entrance* were simultaneous; *i.e.* they were Present to one another. Hence, *speaking* is a Present Participle. The time here is sometimes called *Imperfect;* sometimes *Preter-imperfect.*

275. To denote an action which has taken place in past time, but of which the effects are present, we use the Preterite Participle preceded by *have*, &c. *I have spoken and mean to speak again.*

§. There is a mixture of Past Time and Present in all expressions of this kind. We see this in the very form of them. *Have* is a Verb in the Present Tense; *spoken* a Past Participle.

With this preliminary notice, we may go back to the remarks on the forms *cucurri* and *rexi*, in p. 50; remarks which ought to suggest the following question: "What is the difference between *I spoke* and *I have spoken?*" In Latin they can each be expressed by the same Tense; that Tense being a *Past* one. In English there is a very decided difference between them.

Let two people talk about the object for which they made a certain speech. If one of them begins with "*I spoke,*" he will continue thus—"*that I* MIGHT *persuade my hearers.*" If, however, he says "*I* HAVE *spoken,*" he proceeds with—"*that I* MAY *persuade*, &c.

I spoke that I MAY *persuade,*
Or,
I have spoken that I MIGHT *persuade*

is bad grammar. Whatever their equivalents in other languages may be, such an expression as *I have spoken*, is, in English, as truly Present as *I speak.* Thus—

1. *I speak that I* MAY *persuade.*
2. *I am speaking that I* MAY *persuade.*
3. *I have spoken that I* MAY *persuade.*

yet *spoken* is a Past Participle.

The fact is, that actions thus expressed, though Past, have always some reference to the Present.

1. *I have learned my lesson* may imply either *I am ready to say it;* or, *I don't mean to learn it again.* In either case there is a Present element.

2. *What I have written I have written*, implies *I am prepared to stand by the consequences;* in which there is also a Present element.

In *I learned* or *I wrote* there is no such Present element.

276. To denote a Future action we use the Infinitive preceded by *shall* or *will;* as *I shall speak, he will conquer.*

277. In respect to their relation to one another, in the expression of Time, Verbs are either Verbs Proper or Auxiliar.

§. The Adjective *Auxiliary* means *assistant* or *helping;* being derived from the Latin word *auxilium* = *help.* It is a term often used by grammarians. The best way of ascertaining its meaning is to attend to the following comparisons.

1. Where the Englishman says *to be beaten*, the ancient Roman said *verberari:* the former using a combination of words, the latter a single word in a particular Mood, Tense, and Voice—*verberari* being the Present Tense of the Infinitive Mood of the Passive Voice of *verbero.* Upon the same principle.

2. The English *I am, thou art, he is, we are, ye are, they are—moving* is, in Latin, *moveo, moves, movet, movemus, movetis, movent.*

3. Also, *I was, thou wast, he was, we were, ye were, they were—moving* is, in Latin, *movebam, movebas, movebat, movebamus, movebatis, movebant.*

4. Also, *I have, thou hast, he has, we have, ye have, they have—bitten* is, in Latin, *momordi, momordisti, momordit, momordimus, momordistis, momorderunt.*

5, 6. Also, *I shall, or will, call,* &c., *vocabo, vocabis, vocabit, vocabimus, vocabitis, vocabunt.*

7. Also, *let us go* = in Latin *eamus.*

8. Also, *I have come* (*veni*) *that* (*ut*) *I may see* (*videam*) = *veni ut videam;* whilst *I came that I might see* = *veni ut viderem.*

In all these instances the Latin uses a single word, *i.e.* a verb in a certain Mood, Tense, or Voice, which Mood, Tense, or Voice, is characterized by its particular inflection. In English, however, we look for these inflections in vain. There are *some few* signs of Tense and Mood—but only *some few.* The amount of inflection exhibited in the Latin is wholly wanting.

We have, however, something in the place of it. By combining the words *be*, *am*, *have*, &c., with our Infinitives and Participles we get, if not an actual inflection, an equivalent to one. Now the Verbs that help us to this are called the *Auxiliars*.

278. In many languages the subject of the Verb, when a Pronoun, is omitted. In Latin *Ego* = *I*, *tu* = *thou*, *is* = *he*, *nos* = *we*, *vos* = *ye*, *ii* = *they*. In Latin, however, it is, by no means, necessary to say *Ego voco*, *tu vocas*, &c. It is sufficient to say—

Voco,	*I call.*	*Vocamus,*	*We call.*
Vocas,	*Thou callest.*	*Vocatis,*	*Ye call.*
Vocat,	*He calls.*	*Vocant,*	*They call.*

279. Except in three small classes of words, the Subject in English is always expressed. We cannot say *speakest*, however much the termination *-est* may suffice to show that the word is in the second person. On the contrary, *thou speakest* is the form that must be used.

280. The three cases where the subject may be omitted are (1) that of the Imperative Mood, (2) that of the Optative Preterite, and (3) that of the three Impersonals.

(1) In Imperative Propositions the Subject, being the name of the person spoken to, is suppressed without either ambiguity or inconvenience. We may say—*walk thou—hold thou thy tongue:* but we may also say—*walk—hold thy tongue.*

(2) The word *would*, expressive of a wish, can stand by itself, *i. e.* without any personal pronoun to precede it. We may say—*I would I could:* but we may also say—*would I could.*

(3) The three Impersonals are (1) Methinks, (2) Meseems, (3) Me listeth.

281. In Anglo-Saxon *þencan* signified *think*, whilst

þincan meant *seem*. Hence, *methinks*. *Methinks* and *meseems* mean the same, viz. *it seems, or appears, to me*. Here *me* is in the condition of a Dative Case, and *it* is suppressed or understood. *Me listeth* means *it pleases me*.

282. The Pronoun generally precedes the Verb. Expressions like *said I*, or *says he*, instead of *I said*, or *he said*, are only admitted in very familiar discourse. One verb, however, *always* precedes its pronoun, viz. *quoth*, we always say *quoth he;* never *he quoth*.

283. The second person Singular is only used in solemn discourse, and by members of the Society of Friends. Instead of *speak-est* we say *speak*.

§. The use of *shall* and *will* in connection with the Person of the Verb they precede, has, probably, given rise to more discussion than all the other points of English Grammar put together. In so small a work as the present, the general rule is all that can be given. There are two ways in which we may speak of a future event. We may simply *predict*, or we may *promise* that it will take place. When the proposition which delivers the assertion is simply *predictive*, it means that something will happen hereafter; but says nothing about the intention of the speaker in regard to it. The *promissive* expression brings-in the intention or will of the speaker.

This prepares us for believing that *shall* is the Predictive, *will* the Promissive, Verb. And so they are *to some extent*. A man in a house a-fire says *I* shall *be burned if I don't get out*, where assuredly there is no *intention*, or *will*, on his part.

On the other hand, one of the ancient martyrs, when offered his choice between the stake and the renunciation of his religion, would say *I* will *be burnt*.

So far, so good. The speaker, however, who uses *shall* as the Predictive, uses it for the *first* Person only, reserving *will* for the *second* and *third;* Conversely, *will* is Promissive only when conjoined with *I*. The Promissive for the *second* and *third* person is *shall*.

Wallis's rule, then, runs thus—"In the first persons *shall* predicts; whilst *will* promises or threatens. In the second and third persons *shall* promises or threatens; whilst *will* simply predicts."

Predictive.

Singular.	*Plural.*
1. *I* shall *burn.*	1. *We* shall *burn.*
2. *Thou* wilt *burn.*	2. *Ye* will *burn.*
3. *He* will *burn.*	3. *They* will *burn.*

Promissive.

Singular.	*Plural.*
1. *I* will *burn.*	1. *We* will *burn.*
2. *Thou* shalt *burn.*	2. *Ye* shall *burn.*
3. *He* shall *burn.*	3. *They* shall *burn.*

284. A Singular Subject may have a Plural Predicate; *e. g. Sixpence* is *twelve halfpennies. He* is *all head and shoulders.*

285. A Plural Subject may have a Singular Predicate; as *honest men* are *the salt of the earth.*

286. Every Transitive verb is followed by either a Substantive or a Pronoun.

287. The Substantive or Pronoun that follows a Transitive verb is always in the Objective case. Hence—

Transitive verbs govern an objective case; as, *I strike him, he strikes me;* not *I strike he, he strikes I.*

The reason why every transitive verb is followed by a substantive or pronoun lies in the following fact: viz. that the action expressed by it is never a simple one. On the contrary, it always affects some object or other; as, *I move my limbs; I strike my enemy.* Hence the presence of a transitive verb carries with it the presence of a substantive or pronoun also; which is the name of the object affected.

In such a sentence as *I strike the iron*, the verb *strike* denotes an action, an action that has an effect upon an object; the word *iron* being the name of an object, and the word *strike* the name of the action affecting it. In this case the *action* may be said to *pass off* from the agent (*i. e. the person who strikes*) to the object (*i. e. the iron*); a view which supplies the meaning of the word *transitive.* Verbs expressing actions capable of affecting objects are called transitive verbs, from the Latin word *transire* = *to pass over.*

In saying *I walk*, the verb *walk* denotes an action. It does not, however, denote an action that has any effect upon any object whatever. The action alone, in its simplest form, is stated to take place. Verbs like *walk* are called *intransitive*, because *no* action

can be said to pass off from them to any object. Hence, respecting the government of these two sorts of verbs, there is the following difference; viz. that whilst transitive verbs always govern a noun, and that in the objective case, intransitive verbs govern no case at all; as, *I sleep*, *I walk*, *I think*, &c.

Observe.—The same word has often two meanings, one of which is transitive and the other intransitive; as,

1. *I move*,—where the verb is intransitive, and denotes the mere act of motion. 2. *I move my limbs*,—where the verb is transitive, and where the action affects a certain object (*my limbs*).

1. *I walk*,—where the verb is intransitive, and denotes the mere act of walking. 2. *I walk the horse*,—where the words *I walk* are equivalent to *I cause to walk*, and are also transitive, denoting an action affecting a certain object (*the horse*).

This fact of the same verb having transitive and intransitive meanings must be continually borne in mind; otherwise transitive verbs will appear to be without an objective case, and intransitive verbs to govern one.

288. An Adverb can form, *by itself*, neither the Subject, nor the Predicate of a Proposition. Still less can it form the Copula. How, then, do Adverbs enter into the composition of sentences?

289. Adverbs, by combining with an Adjectival Pronoun, an Adjective, a Participle, or a Verb, form the *parts* of terms—parts of either Subjects or Predicates. *The* very *wisest men are liable to be deceived. Young men are* very *liable to be deceived.*

290. Adverbs denote *manner*, *time*, *order*, *place*, *degree*, *number of times*, &c., &c.; as—the sun shines *brightly*; the sun shines *to-day*; the sun shines *very brightly*; the sun shines *brightly here*; the sun has shone *brightly twice this week.*

Under two circumstances, even Intransitive Verbs may be followed by Nouns in the Objective Case. Whether, however, this gives us a true instance of Government is uncertain.

1. In such an expression as *I have walked ten miles*, the Verb *walk* is Intransitive; yet the Substantive *miles* follows it, and is continued along with it. No Preposition, as in *I walked with a stick* intervenes. There is the Intransitive Verb, and there is the Objective Case, nothing more.

2. Again, to *sleep the sleep* (or *die the death*) *of the righteous* is

to perform an act which is anything but Transitive; however Transitive may be the construction.

In both these instances the sense is, more or less, Adverbial, and the construction is the same. Adverbs give the *manner*, *time*, *degree*, &c., in which acts are performed; and it is clear that to *walk ten miles* is to walk a *certain manner*, or (rather) to a *certain degree*. In like manner, to *sleep the sleep of the righteous*, is to *sleep after the manner of a righteous man*.

In this last instance the Noun is said to be *cognate* to the Verb; and there is an old rule to the effect, that *any Verb whatever, whether Transitive or Intransitive, can be followed by a Noun in the Objective Case, provided that Noun be a Cognate one.*

§. The Case Absolute used to be the Dative; as

— only in destroying I find ease
To my relentless thoughts, and *him destroy'd*,
Or won to what may work his utter loss
For whom all this was made, all this will soon
Follow. P. L. 9. 130.

Solomon made as wise proverbs as any one has done, *him only excepted*, who was a much wiser man than Solomon.—*Tillotson.*

Instead of this dative absolute, modern English writers generally give us the pronoun in the nominative. Bentley, in his edition of the Paradise Lost, corrects this syntax whenever he meets with it: for *I extinct*, 9. 629; *thou looking on*, 9. 312; *thou leading*, 10. 267; *he not found*, 10. 1001, &c.; he reads *me extinct*, *thee looking on*, *thee leading*, *him not found*, &c. His criticism was no doubt suggested by the laws of Latin grammar, but he would not have ventured upou it, had it not been borne out by contemporary English usage. The use indeed of the nominative, in these cases, does not admit of easy explanation. It is unknown to the older and purer dialects of our language, and probably originated in the use of the indeclinable pronoun, with which Milton was certainly acquainted.—Dr. Guest.

291. A Preposition can form, *by itself*, neither the Subject nor the Predicate of a Proposition. Still less can it form the Copula. How, then, do Prepositions enter into the composition of sentences?

292. Prepositions, by combining with Pronouns and Substantives, form parts of *terms*—parts of either Subjects or Predicates.

293. Prepositions give the relation of one Noun to another. *I was* in *London*. *The sun shines* through

the air with *its beams.* *He spoke* to *me.* *I thought* of *him*, &c.

294. Every Preposition governs a Case; and unless a word do so it is no Preposition.

This enables us to separate Prepositions from Adverbs: and as several words are doubtful, the test is important. To *get on* is to *proceed;* to *go up* is *to ascend*, in which instances the words *on* and *up* are Adverbs, meaning *onwards* and *upwards.* In *get on the horse* and *climb up the tree*, the same words are Prepositions governing a Case. So also

Adverbs.	*Prepositions.*
Put it *in.*	Put it *in the box.*
Pass *by.*	Pass *by the place.*
Go *out.*	Bring it *out of the box.*

The difference between the Preposition and the Conjunction will be seen in the sequel.

§. It by no means follows that, because a Noun is immediately preceded by a Preposition, it is *governed* by it. In such an expression as *this is a picture of John's*, the word which the Preposition *of* governs is not *John's*, but *pictures* understood.

Expressions like *the King of Saxony's army*, or, *the Queen of England's crown*, are somewhat more obscure, the sign of the Possessive Case being attached to the words *Saxony* and *England.* Yet the possessors of the *army* and the *crown* are not the countries of *Saxony* and *England*, but the *King* and *Queen* who rule over them. The true accurate construction would be *of Saxony, the King's army—of England, the Queen's crown;* or (perhaps) *the King's army of Saxony, the Queen's army of England.* In other words the *'s*—the sign of the Possessive Case—really belongs to *King* and *Queen.*

§. Sentences consisting of a single Proposition have already been considered. Those which contain two now come under notice.

295. Sentences consisting of two Propositions are called Complex. They always contain either a Relative Pronoun, as *the sun, which shines to-day will shine to-morrow*, or a Conjunction, as *the sun shines, and therefore the day will be fine.*

§. Sometimes the structure of these complex sentences is extremely simple. This is the case when the second proposition follows the first, and the two stand apart from each other, in such a way as to be easily separated. If I say the *man is coming who*

brings the letters, we know exactly where one proposition ends, and where the other begins. We find, too, that the analysis of the expression is of the easiest. We see that *the man is coming* constitutes one proposition ; *who brings the letters*, another. We see that two actions are denoted, (1) the act of *coming ;* (2) the act of *letter-carrying*. We see, too, that, although there are two actions, there is but one agent ; for the man *who comes* is the same person as the man who *carries the letters*. Such being the case, the word *who* means *the man*, and *relates* to it ; whilst the word *man* explains what is meant by *who*, and *goes before it* as an *antecedent ;* for in Latin, *ante* = *before*, and *cedo* = *go ;* so that *ante-cedent* is *that which goes before*. All this is clear, and may be made clearer by writing the two propositions separately ; as

The man is coming ;
Who brings the letters.

Here, the separation of the two propositions is complete ; so complete that, we may, if we choose, consider that they form two distinct sentences.

To show that *who* means *the man*, we may, if we please, write

The man is coming,
He brings the letters.
Or,
The man is coming,
The man brings the letters.

The result is the same. There are two actions and one agent. Instead, however, of naming the agent twice, we use a word that *relates* to him.

All this is clear. It is, however, well known that, although complex sentences, like the one just given, are easily constructed, they are, by no means, very common in the actual course of language ; wherein few persons keep the two propositions separate. On the contrary, they blend them together, and say *the man who brings the letters is coming*. This, although it adds a little to the complexity, ought not to create a difficulty. A little consideration tells us that we may say

1. The man is coming ; the man brings the letters ; *or*,
2. The man is coming ; he brings the letters ; *or*,
3. The man is coming ; who brings the letters ; *or*,
4. The man [who brings the letters] is coming.

The Relative means the same as the Antecedent, and is only the Antecedent under another form.

296. For Complex sentences containing a Relative Pronoun there are two important rules.

297. The Relative and the Antecedent are, of necessity, in the same Gender.

298. The Relative and Antecedent are, of necessity, in the same Number.

§. These rules are universal ; for they apply not only to the English language, but to all others. Such being the case, their importance becomes manifest. Such, too, being the case, it may be well to devote some time and attention to obtaining a clear view of them. Every Relative has its Antecedent, and every Antecedent its Relative. A Relative without an Antecedent, or an Antecedent without a Relative, is impossible. The one, indeed, is necessary to the other ; so that the words belong to the same class as *father* and *son*, *husband* and *wife*, *ruler* and *subject*, and the like. There would be no such things as *husbands* if it were not for the *wives*. There would be no such things as *rulers*, if it were not for the *subjects over whom they rule*, and *vice versâ*. In like manner, an Antecedent without a Relative is no Antecedent at all, and a Relative without an Antecedent is a contradiction in terms.

As the Relative is the Antecedent in another form, it follows that the Gender and Number must be the same ; so that the principle of the second and third general rules is explained.

On the other hand, the Relative is *not* necessarily in the same *case* as the Antecedent ; *e. g.*

1. John [*who* trusts me] comes here ;
2. John [*whom* I trust] comes here ;
3. John [*whose* trust is in me] comes here ;
4. I trust John [*who* trusts me].

§. Besides the two great Concords of Gender and Number, there is, also, between the Relative and Antecedent, one of Person ; as, *I, who am your master, am coming*. The Concord of Person, however, makes no change in the form of the Relative itself ; inasmuch as we say *I who*, *thou who*, *he who*, *we who*, *ye who*, and *they who*. It tells, however, upon the Verb, which, taking the Person of the Relative, takes that of the Antecedent also. In the example just given, *am* depends *immediately* upon *who*. Meanwhile, *who* depends on *I;* the result being that the Verb is in the first Person. To say *I, who* is *your master, am coming*, is wrong.

The exceptions to this Concord are only apparent. Neither are they very important. How they occur may be seen by writing such a sentence as *it is I, your master, who command you*, and then asking whether we might not, instead of *command*, have put *commands*—in which case the sentence would run—*it is I, your master, who commands you*—a sentence which, whether right or wrong, is, by no means, generally condemned.

Supposing it, however, to be accurate, it gives no exception to the foregoing rule.

That *I* is in the first Person is clear. So it is that *commands* is in the third. The Antecedent, however, to *commands* is not the Pronoun *I*, but the Substantive *master*.

299. The Relative is occasionally omitted; *e. g.* we may say *the books I want are come*, instead of *the books which I want*, &c.

§. There are few better specimens of a true Ellipsis than a sentence of this sort. If written in full it would exhibit three essential elements; viz. the first proposition, the second proposition, and the relative, by which they are connected. In the instance before us, the first proposition is *the books are come;* in the second, *I want*. Where, however, is the word that connects them? I may *want* many things besides *books*. Yet the expression, as it stands, is sufficient to show what I mean. In full, however, it should be *the books* [*which*] *I want are come*. But as it is *not* given in full, it is Elliptical, and the Relative is said to be understood.

300. The Antecedent may appear in either the Subject or the Predicate; and it may be called Subjective or Predicative accordingly.

301. It appears in the Subject in such sentences as *he steals trash | who steals my purse.*

302. It appears in the Predicate in such sentences as *I punished him | who stole my purse.*

303. When *he*, *they*, or *those* are Subjective Antecedents, they may be omitted; *who steals my purse steals trash.*

§. This omission is not necessary. We may, if we choose, say *he who steals*, &c. A well-known pair of couplets runs thus—

He who fights and runs away
May live to fight another day;
But *he* who is in battle slain
Will never live to fight again.

If it were not, however, for the metre, *he* might be omitted; and the sentence run *who fights and runs away may live*, &c.

304. When *that* is a Predicative Antecedent it may

be omitted; in which case it is followed by *what* rather than *which*. Thus for

I see *that*
Which you mean,

we may write

I see
What you mean.

305. *What* is also used when the Antecedent is *this* or *that*. We say—*This is what I mean, and that is what I do not mean*. In other cases we use *which*.

306. *Which* is used in both Numbers. We say—*The dagger which stabbed Cæsar*, and *the daggers which stabbed Cæsar*.

307. *That*, though originally a Demonstrative, may be used as a Relative in the place of *who*, *whom*, and *which*; as *he that spoke; she that spoke; they that spoke; the man that I spoke to*.

§. The construction of the Relative is by no means easy, and some well-known inaccuracies connected with it are to be found even in our best writers. For instance—each of the following passages is inaccurate.

——— *him* I accuse
The city gates by this has enter'd.
Coriolanus.

Better leave undone, than by our deeds acquire
Too high a fame when *him* we serve 's away.
Antony and Cleopatra.

Here, instead of *him* we should have *he*.

The explanation, however, of the error is, by no means, difficult. There is an Ellipsis. The full forms would be *he whom I accuse has entered the city gates, he whom we serve is away*.

Now rule 303 has shown that the Antecedent may be omitted; so that we may, if we choose, write *whom I accuse has entered the city gates*, or, *whom we serve is away*.

And rule 299 has shown that the Relative may be omitted; so that we may, if we choose, write *he I accuse has entered*, &c., or, *he we serve is away*.

No rule, however, says that *both* can be dispensed with.

In the instances before us, however, there is a confusion. It is the Relative which is omitted, whilst (as if by way of compensation) the Antecedent is put in the Relative's case.

The following instance is also exceptionable.

——— Satan than *whom*
None higher sat, thus spake.

Paradise Lost.

Whom ought to be *who*.

By writing sentences like these in full we easily ascertain the true construction.

Satan spake:
None higher sat than Satan sat.

308. When two words, each capable of being an Antecedent, occur in the same proposition, the Antecedent is ambiguous. *Solomon the son of David, who* —unless we know what follows, we cannot say whether *who* refers to David, or to Solomon.

§. In order to avoid this ambiguity, grammarians have laid it down as a rule that the latter of the two words is the Antecedent. It is doubtful, however, whether the rule is absolute. At any rate, it is often violated. The same writer who says *Solomon the son of David, who slew Goliath*, may also say *Solomon, the son of David, who built the temple;* and it is doubtful whether one expression is not as accurate as the other. In order, however, to justify it, we must treat *Solomon-the-son-of-David* as a single word.

309. Conjunctions connect Terms, as, *all men are black or white.*

310. In general, a difference of Terms corresponds with a difference of Propositions; so that in most cases, Conjunctions connect Propositions as well as Terms.

The day is warm
because
The sun is bright.

311. When two Propositions have the same Subject, they look like a single one; though, in reality, the Subject is repeated, and the Propositions are double.

The sun is bright and warm,
is, in full,
The sun is bright,
The sun is warm.

312. When two Propositions have the same Predi-

cate, they look like a single one; though, in reality, the Predicate is repeated, and the Propositions are double.

The sun and moon shine,
is, in full,
The sun shines.
The moon shines.

313. When the Predicate applies to one of two Subjects, it is in the Singular Number.

The sun or moon shines,
is, in full,
The sun shines
or
The moon shines,
i.e.
One of the two shines.

314. When the Predicate applies to more than one subject, it is in the Plural Number.

The sun and moon shine,
is, in full,
The sun shines
and
The moon shines,
i.e.
Both shine.

§. The Syntax of Conjunctions, by far the most difficult part of Grammar, is closely allied to that of Adverbs, Prepositions, Verbs, and Relative Pronouns. In these relations consists a great part of its difficulty—a difficulty of which the general character is easily understood. Whilst other words connect only the parts of the same proposition, Conjunctions connect different propositions. In order to understand how many different kinds of Conjunctions can exist, we must know all the ways in which one proposition may be connected with another. Many propositions are wholly unconnected. Propositions delivered at long intervals, or by different persons, have, for the most part, no relation to each other. In consecutive conversation, however, one statement depends on another. Thus—

I am pleased,
because
This has happened;
but
I should have been disappointed,
if

It had fallen out otherwise.
and
I think
that.
Even now, some of my real
or
Supposed friends will be more surprised
than
Satisfied with the arrangement.

315. Conjunctions which connect two or more Terms are called Copulative; as *and*.

316. Conjunctions which connect one of two Terms are called Disjunctive; as *or*.

317. Disjunctives are either true Disjunctives or Subdisjunctives.

318. A true Disjunctive separates *things*. When we say *the sun or the moon is shining*, we separate two different objects, one of which shines by day, the other by night.

319. Subdisjunctives separate *names*. When we say *Victoria, or the Queen of England, is our sovereign*, we speak of the same object, under different names.

§. As *conjungo* means *join together* or *unite*, and as *disjungo* means *disjoin* or *separate*, it seems strange to talk of *Dis*junctive *Con*junctions. Still, stranger is it to say that Disjunctives effect connections. Strangest of all is it to add that "true Disjunctives separate things." It is easy, however, to reconcile the use of the two terms. In using such an expression as *John or Thomas is coming to-day*, we not only unite, but separate. *Come* is the Predicate; and this we unite with the Subject. But there are two Subjects—*John* and *Thomas:* which belongs to the Predicate? That we cannot say. We only know that one of them, and *one only*, so belongs. If *both* belonged, we should say *John and Thomas are coming*. But then the construction would not be Disjunctive. By stating that out of two Subjects one only belongs to the Predicate, we separate them from each other; though with the Predicate itself we unite them.

320. The idea expressed by a Copulative may be strengthened and made clearer by the addition of the

words *each*, *both*, *all three*, or the like. We may say *both sun and moon are shining. All, Venus, Jupiter, and the Dogstar, are visible.* We may also say *sun and moon are both shining—Venus, &c., are all visible.*

321. The idea expressed by a Disjunctive may be strengthened and made clearer by the addition of *either*. We may say, *either the sun or the moon is shining.*

322. The idea expressed by a Subdisjunctive may be strengthened and made clearer by the phrase *in other words*. We may say *Queen Victoria, in other words, the Queen of England*, &c.

323. In all these cases the words *both*, &c., *either*, &c., and *in other words*, &c., are no true Conjunctions. They strengthen the Conjunction. The Conjunction, however, exists without them.

324. *Or* and *either* have their corresponding Negatives—*nor* and *neither*. *I will either come or send* is right. So is *I will neither come nor send.* But I will *neither come or send* is wrong.

325. When a question is either asked or implied, *whether* takes the place of *either*.

§. Words like *either*, &c., are generally treated as Conjunctions. This, however, they are not. The most that can be said of them is that they form part of certain Conjunctional expressions. They never stand alone. Meanwhile, the words with which they correspond can, as a general rule, do without them. We say *this or that—mine nor his*, quite as correctly as *either this or that—neither mine nor his.*

If, then, they are not Conjunctions, what are they? *Both* is decidedly a Noun. *Either*, however, *neither* and *whether*, seem to be both Nouns and Adverbs. When *either* means *one out of two*, it is a Pronoun. When it means *in the way of an alternative*, it is an Adverb.

326. Conjunctions which denote the dependence of one act on another are Causal, Illative, Final, and Conditional.

327. Causals give the cause of a given effect.

The day is warm
because
The sun shines.

328. Illatives give the effect of a given cause.

The sun shines,
therefore
The day is warm.

329. Finals give the object for which a given action is effected.

I do this
that
You may follow my example.

330. Conditionals give the conditions on which a given event depends. *The night will be fine if the stars shine.*

331. Copulative, Disjunctive, and Subdisjunctive Conjunctions must be considered in respect to the *Number* of the Verb with which they come in contact.

332. Copulatives require Plural, Disjunctives and Subdisjunctives a Singular, Number.

333. When *that* signifies intention, the Verb which follows must be in the same Tense as the Verb which precedes it.

1. I *do* this *that* I *may* succeed.

2. I *did* this *that* I *might* succeed.

334. *Conditional* Conjunctions govern the Subjunctive Mood.

335. The chief Conditional Conjunction is *if*. To say if the *sun shines the day will be clear* is inaccurate. The proper expression is, *if the sun shine*, &c.

Although the word *if* is the type and specimen of the Conditional Conjunction, there are several others so closely related to it

in meaning as to agree with it in requiring a Subjunctive Mood to follow them.

1. *Except* I be by Silvia in the night,
There is no music in the nightingale.
Two Gentlemen of Verona.

2. Let us go and sacrifice to the Lord our God *lest* he *fall* upon us with pestilence.

3. Let him not go *lest* he die.

4. He shall not eat of the holy thing *unless* he *wash* his flesh with water.

5. *Although* my house *be* not so with God.

6. —— revenge back on itself recoils. Let it. I reck not *so* it *light* well aimed.

7. Seek out his wickedness *till* thou *find* none.

And so on with *before*, *ere*, *as long as*.

On the other hand, *if* itself is not always conditional, being occasionally equivalent to *since;* in which case it may be followed by an Indicative Mood.

336. *As* follows Adjectives or Adverbs of the Positive Degree, preceded by *so*. *Be so kind as to come here.*

337. *Than* follows Adjectives and Adverbs of the Comparative Degree. *This is sharper than that. I see better to-day than yesterday.*

338. *Than*, in respect to its etymology, is neither more nor less than *then*. It is not difficult to see the connection in sense between such sentences as *I like this better than I like that*, and *I like this—then* (*afterwards or next in order*) *I like that.*

339. *Than* is sometimes treated as a Preposition; when it governs a case.

Thou art a girl as much brighter than *her*,
As he is a poet sublimer than *me*.—PRIOR.
You are a much greater loser than *me*.—SWIFT.

340. It is better, however, to treat it as a Conjunction, in which case the Noun which follows it depends upon the Verb of the antecedent clause. 1. *I like you better than he = I like you better than he likes*

you. 2. *I like you better than him = I like you better than I like him.*

341. *But*, in respect to its etymology, is *be-utan = by-out.* It is not difficult to see the connection in sense between such sentences as *all but one*, and *all without* (or *except*) one.

342. *But*, then, is a Preposition and an Adverb, as well as a Conjunction. Its Prepositional construction is—*They all ran away but me*, i. e. *except me*. Its Conjunctional Construction is—*They all ran away but I*, i. e. *but I did not run away.*

343. When two or more Nouns, in the Singular number, are connected by a Preposition, the verb is Singular.

The father, with the son, is coming.

344. When two or more nouns, in the Singular number, are connected by a Copulative Conjunction, the Verb is Plural—*the father and son are coming.*

345. No Conjunction can govern a case. A word that governs a Case, be it ever so like a Conjunction, is no Conjunction but a Preposition.

Yes and *No* are, perhaps, words sufficiently peculiar to justify us in treating them as a separate Part of Speech: for it may be observed that, unlike any word hitherto noticed, they constitute a whole Proposition by themselves. *Yes = it is*, while *no = it is not.* At the same time, they depend upon what has preceded, for unless a question has been asked how is an answer to be given? There is nothing to reply to.

346. The Negative follows the Verb unless it be in the Infinitive Mood; in which case it precedes it;—*He spoke not, he moved not, he did not, he could not;* but *not to advance is to retreat; he did not speak, he could not move.*

347. Two Negatives make an Affirmative. *I have not not seen him = I have seen him.*

348. A question to which no answer can be given is much the same as a Negative. A person who, in extreme perplexity, says *what I am to do* really means *I know not what to do*. These are called Questions of Appeal.

349. In all questions there is a transposition of the Terms. In *what is this* the word *what* is the Predicate. Yet it begins the sentence. In *is he at home*, the word *is*, though it begins the sentence, is a *Copula*.

350. When the Copula precedes the Predicate, the question is Categorical, and its answer is *Yes* or *No*. —Question. *Is John at home?* Answer. *Yes* or *no* as the case may be.

351. When the Predicate precedes the Copula the question is Indefinite, and the answer may be anything whatever. To *where is John?* we may answer *at home—abroad—in the garden—in London—I do not know*—&c., &c.

PROSODY.

352. Prosody delivers the rules for the construction and recitation of verses. English verse depends almost wholly upon accent.

353. In all sentences there is a certain number of accented syllables. In prose they recur at irregular, in verse at regular, intervals.

§. In the following lines every other syllable is accented :—

1. The wáy was lóng, the wínd was cóld,
   The mínstrel wás infírm and óld.
2. To árms ! to árms ! the clánsmen róam
   O'er híll, and dále, and glén ;
   The chíef is déad, and tíme is come
   To chóose a chíef agáin.

In all these instances it is the *even* syllables, *i. e.* the second, fourth, and sixth, upon which the accent lies.

§. In the following examples it is the *odd* syllables, *i. e.* the first, third, and fifth, which are so affected.

Láy thy bów of peárl apárt,
A'nd thy sílver shíning quíver:
Gíve untó the flýing hárt
Tíme to breáthe, how shórt soéver;
Thoú that mák'st a dáy of níght,
Góddess éxquisítely bríght.—BEN JONSON.

§. In the word *mérrily* we have two unaccented to one accented syllable; the accent being on the first syllable of the three.

Mérrily, mérrily, sháll I live nów,
U'nder the blóssom that hángs on the boúgh.
SHAKESPEAR.

Here the first and fourth syllables are accented.

§. In *disáble* the accent is on the second syllable of the three; and in the following lines it is the second and fifth syllables on which the reader lays stress.

But vaínly thou wárrest,
For thís is alóne in
Thy pówer to decláre,
That ín the dim fórest
Thou heárd'st a low moáning,
And sáw'st a bright lády surpássingly faír.—COLERIDGE.

§. In

In my ráge shall be séen,
The revénge of a quéen,

the accented syllables are the third and sixth.

354. The length of a verse may be measured in two ways. We may say that it consists of so many syllables, or we may say that it consists of so many accents.

§. In

The wáy was lóng, the wínd was cóld,

the number of syllables is eight; that of the accents four.

In

But váinly thou wárrest,

there are two accents to six syllables.

It is best to count by the accents; but in doing this, we must remember that the last syllable of a line is not reckoned.

355. Metrical groups of syllables formed are called measures.

1. The wáy | was lóng, | the wínd | was cóld—
2. Tīme to | breáthe, how | shórt so | ēver—
3. Mérrily, | mérrily, | sháll I live | nów—
4. But váinly | thou wárrest—
5. In my rágе | shall be seén—

Here the number of measures is five; two of which are dissyllabic, and three trisyllabic.

356. Metre that is formed exclusively by means of the regular recurrence of accented syllables, is called blank verse.

Of man's first disobedience and the fruit
Of that forbidden tree, whose mortal taste
Brought death into the world and all our woe,
With loss of Eden, till one greater Man
Restore us, and regain the blissful seat,
Sing, Heavenly Muse!—MILTON.

The quality of mercy is not strain'd.
It droppeth as the gentle dew from heaven
Upon the place beneath; it is twice bless'd,
It blesseth him that gives, and him that takes;
'T is mightiest of the mighty, it becomes
The thronéd monarch better than his crown.
His sceptre shews the force of temporal power,
The attribute of awe and majesty,
Wherein doth sit the dread and fear of kings:
But mercy is above this sceptred sway;
It is enthronéd in the hearts of kings:
It is an attribute to God himself;
And earthly power doth then shew likest God's,
When mercy seasons justice.—SHAKESPEAR.

§. Though the Paradise Lost, the tragedies of Shakespear, and many other poems, are written in blank verse, the more usual metres exhibit something more than the simple harmony of the regularly-recurring accents.

§. They generally exhibit what is called *rhyme*.

Couplets.

O'er the glad waters of the dark blue *sea*,
Our thoughts as boundless, and our souls as *free*.
Far as the breeze can bear the billow's *foam*,
Survey our empire and behold our *home*.
These are our realms, no limits to our *sway*—
Our flag the sceptre all who meet *obey*.—BYRON.

Rhymes alternate.

Full many a gem of purest ray *serene*
The dark, unfathom'd caves of ocean *bear;*
Full many a flower is born to blush un*seen*,
And waste its sweetness on the desert *air.*—GRAY.

Rhymes sometimes alternate, sometimes in succession.

And yet how lovely in thine age of *woe*,
Land of lost gods and godlike men, art *thou!*
Thy vales of evergreen, thy hills of *snow*,
Proclaim thee Nature's varied favourite *now*
Thy fanes, thy temples to thy surface *bow*,
Commingling slowly with heroic *earth*,
Broke by the share of every rustic *plough:*
So perish monuments of mortal *birth*,
So perish all in turn, save well-recorded *worth.*—BYRON.

§. For two (or more) words to rhyme to each other, it is necessary

a. That the sound of the vowel be the same in both.

b. That the sounds following the vowel be the same.

c. That the sounds preceding the vowel be different.

Beyond this it is necessary that the syllables, to form a full and perfect rhyme, should be accented. *Sky* and *lie* form good rhymes, but *sky* and merri*ly* bad ones, and *merrily* and *silly* worse.

The letter *h* counts as nothing. *High* and *I*, *hair* and *air*, are imperfect rhymes; because *h* is no articulate sound.

Whose generous children narrow'd not their *hearts*
With commerce, giv'n alone to arms and *arts.*—POPE.

Words where the letters coincide, but the sounds differ, are only rhymes to the eye. *Breathe* and *beneath* are in this predicament; so also are *cease* and *ease* (*eaze*).

In the fat age of pleasure, wealth, and *ease*,
Sprang the rank weed, and thrived with large in*crease.*—
POPE.

On the other hand, if the sounds coincide, the difference of the letters is unimportant.

Bold in the practice of mistaken *rules*,
Prescribe, apply, and call their masters *fools.*—POPE.

They talk of principles, but notions *prize*,
And all to one loved folly sacri*fice.*—POPE.

§. In order to go further into the investigation of the nature of rhyme, let us analyze a pair of syllables. Let *told* and *bold* be taken to pieces, and let the separate parts of each be compared.

They consist of three parts or elements: 1. the vowel (*o*); 2. the part *preceding* the vowel (*t* and *b* respectively); 3. the parts *following* the vowel (*ld*). Now, the vowel (*o*) and the parts following it (*ld*) are alike in both words (*old*); the part preceding the vowel different (*told*, *bold*). This difference is essential.

Compared with the words *bold* and *told*, the words *teeth* and *breeze* have two of the elements necessary to constitute a rhyme. The vowels are alike (*ee*), whilst the parts preceding the vowels are different (*br* and *t*); and, as far as these two matters are concerned, the rhyme is a good one, *tee* and *bree*. Notwithstanding this, there is no true rhyme; since the parts following the vowel (*th* and *ze*) differ.

Again—the words *feel* and *mill* constitute only a false and imperfect rhyme. Sound for sound, the letters *f* and *m* (the parts preceding the vowel) are different. This is as it should be. Also, sound for sound, *l* and *ll* (the parts following the vowel) are identical; and this is as it should be also: but *ee* and *i* (the vowels) are different, and this difference spoils the rhyme.

§. *Single Rhymes.*—An accented syllable standing by itself constitutes a single rhyme.

'T is hard to say if greater want of *skill*
Appear in writing or in judging *ill;*
But, of the two, less dangerous is the of*fence*
To tire the patience than mislead the *sense.*
Some few in that, but thousands err in *this;*
Ten censure wrong, for one that writes a*miss.*—POPE.

§. *Double Rhymes.*—An accented syllable followed by an unaccented one constitutes a double rhyme.

Prove and explain a thing till all men *doubt it,*
And write about it, Goddess, and a*bout it.*—POPE.

§. *Treble rhymes.*—An accented syllable followed by two unaccented ones constitutes a treble rhyme.

Beware that its fatal as*céndancy*
Do not tempt thee to mope and repine;
With a humble and hopeful de*péndency*
Still await the good pleasure divine.

Success in a higher be*átitude,*
Is the end of what's under the pole;
A philosopher takes it with *grátitude,*
And believes it the best on the whole.—BYRON.

§. Accent is essential to English metre. Rhyme, on the other hand, is only an ornament. Of all the ornaments of English versification it is undoubtedly the most important.

Practice.

I. { *Measure.*—Dissyllabic.
{ *Accent.*—On the odd syllables; *i. e.* on the first, third, &c.

Four measures with double and single rhymes alternatively :—

Then her countenance all over
  Pale again as death did prove;
But he clasp'd her like a lover,
  And he cheer'd her soul with love.
So she strove against her weakness,
  Though at times her spirits sank;
Shaped her heart with woman's meekness
  To all duties of her rank.
And a gentle consort made he
  And her gentle mind was such,
That she grew a noble lady,
  And the people loved her much.
But a trouble weigh'd upon her,
  And perplex'd her night and morn
With the burden of an honour
  Unto which she was not born.—TENNYSON.

Five measures, rhyme double :—

Nárrowing ín to whére they sát asséembled,
Lów volúptuous músic wínding trémbled.

Rhyme single :—

Thén methoúght I heárd a hóllow soúnd,
Gáth'ring úp from áll the lówer groúnd.

The two varieties mixed :—

Then methought I heard a hollow sound
Gath'ring up from all the lower ground.
Narrowing in to where they sat assembled,
Low voluptuous music winding trembled;
Wov'n in circles: they that heard it sigh'd,
  Panted, hand in hand, with faces pale,
Swung themselves, and in low tones replied;
Till the fountain spouted, showering wide
  Sleet of diamond-drift and pearly hail:
Then the music touch'd the gates and died.—TENNYSON.

Six measures :—

O'n a moúntain, strétch'd beneáth a hoáry wíllow,
Láy a shépherd swaín, and víew'd the rólling bíllow.

Seven measures :—

Wé have hád enoúgh of áction ánd of mótion; wé—
Lét us sweár an oáth, and kéep it, wíth an équal mínd—
TENNYSON.

Eight measures :—

Cómrades, leáve me hére a líttle, whíle as yét 'tis eárly mórn :
Leáve me hére; and, whén you wánt me, soúnd upón the búgle hórn.—TENNYSON.

Lines of this formula occur either mixed or unmixed; as—

Unmixed :—

Here about the beach I wander'd, nourishing a youth sublime
With the fairy tales of science, and the long results of Time ;
When the centuries behind me, like a fruitful land reposed ;
When I clung to all the Present for the promise that it closed ;
When I dipp'd into the Future, far as human eye could see,
Saw the vision of the world, and all the wonder that would be—
In the spring a fuller crimson comes upon the robin's breast ;
In the spring the wanton lapwing gets himself another crest ;
In the spring a livelier iris changes on the burnish'd dove ;
In the spring a young man's fancy lightly turns to thoughts of love.
Then her cheek was pale and thinner than should be for one so young,
And her eyes on all my motions with a mute observance hung.
And I said, "My cousin Amy, speak, and speak the truth to me;
Trust me, cousin, all the current of my being sets to thee."

TENNYSON.

Mixed with other measures :—

We have had enough of action and of motion; we
Roll'd to larboard, roll'd to starboard, when the surge was seething free,
Where the wallowing monster spouted his foam-fountains in the sea.
Let us swear an oath, and keep it, with an equal mind,
In the hollow lotos-land to live and lie reclined
On the hills, like gods together, careless of mankind :
For they lie beside their nectar, and their bolts are hurl'd
Far below them in the valleys, and the clouds are lightly curl'd
Round their golden houses, girdled with the gleaming world;
Where they smile in secret, looking over wasted lands,
Blight and famine, plague and earthquake, roaring deeps and fiery sands,
Clanging fights, and flaming towns, and sinking ships, and praying hands.—

Surely, surely slumber is more sweet than toil ; the shore,
Than labour in the deep mid-ocean, wind, and wave, and oar.
Oh ! rest ye, brother mariners, we will not wander more.

TENNYSON.

II. { *Measure.*—Dissyllabic as before.
{ *Accent.*—On the even syllables, *i. e.* on the 2nd, 4th, &c.

Two measures :—

Unheárd, unknówn,
He mákes his móan—

The straíns decáy,
And mélt awáy.

What soúnds were héard !
What scénes appéar'd—

Upón a moúntain,
Besíde a foúntain.

Three measures, rhyme single :—

With hóllow blásts of wínd—
All ón a róck reclíned.

Rhyme double :—

'Twas whén the seás were roáring—
A dámsel láy deplóring.

Alternate :—

'Twas when the seas were roaring
With hollow blasts of wind,
A damsel lay deploring,
All on a rock reclined.
Wide o'er the foaming billows
She cast a wistful look ;
Her head was crown'd with willows,
That trembled o'er the brook.—GAY.

Four measures : —

On, on he hasten'd, and he drew
My gaze of wonder as he flew.
Though like a demon of the night
He pass'd and vanish'd from my sight,
His aspect and his air imprest
A troubled memory on my breast;
And long upon my startled ear
Rung his dark courser's hoofs of fear.—BYRON.

Five measures :—

Fond fool ! six feet of earth is all thy store,
And he that seeks for all shall have no more.—BISHOP HALL.

The meeting points the sacred hair dissever,
From her fair head for ever and for ever.—POPE.

§. The general term for metres of five accents, with the accent on the even syllables, is Heroic. The first division into which the heroic metres fall is into, *a*. Blank heroics, *b*. Rhyming heroics.

Blank Heroics.—Blank heroics, or blank verse, as it is generally called, falls into two varieties, determined by the nature of the subject-matter ; *a*. Dramatic blank verse ; *b*. Narrative blank verse.

Dramatic Blank Verse.—With the exception of the earliest dramas in the language, and some rhyming tragedies written in imitation of the French in the time of Charles II., the works

for the English stage consist chiefly of either prose or blank verse. It is in blank verse that most tragedies and many comedies are either wholly or partially written.

Dramatic blank verse not only admits, but calls for, supernumerary syllables. In rhyming metres these would constitute double rhymes.

OTHELLO'S SPEECH BEFORE THE SENATORS.

Most potent, grave, and reverend seigniors,
My very noble and approved good *masters*,
That I have ta'en away this old man's *daughter*,
It is most true: true, I have married her:
The very head and front of my of*fending*
Hath this extent, no more. Rude I 'm in speech
And little bless'd with the set phrase of peace,
For since these arms of mine had seven years' pith
Till now, some nine moons wasted, they have used
Their dearest action in the tented field,
And little of this great world can I speak,
More than pertains to feats of broil and *battle;*
And therefore little shall I grace my cause
In speaking of myself: yet by your *patience*
I will a round unvarnish'd tale deliver
Of my whole course of love; what drugs, what charms,
What conjuration, and what mighty *magic*,
(For such proceedings am I charged withal,)
I won his daughter.—SHAKESPEAR.

Narrative Blank Verse.—The metre of Paradise Lost, Paradise Regained, Young's Night Thoughts, Cowper's Task, Cowper's Homer, &c.

Nine times the space that measures day and night
To mortal men, he, with his horrid crew,
Lay vanquish'd, rolling in the fiery gulf
Confounded, though immortal: but his doom
Preserved him to more wrath, for now the thought
Both of lost happiness and lasting pain
Torments him.—MILTON.

Here the admission of a supernumerary final syllable is rare; lines of *eleven* syllables like the following being uncommon.

Of sovran power with awful ceremo*ny*.—MILTON.

Six measures:—

He lífted úp his hánd that báck agaín did stárt.

Seven measures:—

The Lórd descénded fróm abóve, and bów'd the heavéns most hígh,
And úndernéath his feét he cást the dárkness óf the ský.

STERNHOLD AND HOPKINS.

Eight measures :—

Where vírtue wánts, and více aboúnds and weálth is bút a baíted
hoók
Wherewíth men swállow dówn the báne befóre on dánger dárk
they loók.

III. { *Measure.*—Trisyllabic.
{ *Accent.*—On the 1st, 4th, &c., syllables.

Two measures :—

Píbroch o' Dónuil Dhu !
Píbroch o' Dónuil !
Wáke thy shrill voíce anew,
Súmmon Clan Cónnuil.
Cóme away, cóme away,
Hárk to the súmmons !
Cóme in your wár array,
Géntles and cómmons.—
Cóme ev'ry híll-plaid, and
Trúe heart that wéars one ;
Cóme ev'ry steél blade, and
Stróng hand that beárs one.—
Leáve the deer, leáve the steer,
Leáve nets and bárges :
Cóme with your fíghting-gear,
Broádswords and tárges.
Cóme as the wínds come, when
Fórests are rénded ;
Cóme as the wáves come, when
Návies are stránded ;
Fáster come, fáster come,
Fáster and fáster,
Chiéf, vassal, páge, and groom,
Ténant and máster.
Fást they come, fást they come,
Sée how they gáther !
Wíde waves the eágle plume,
Blénded with heáther.

Cást your plaids, dráw your blades,
Fórward each mán set !
Píbroch of Dónuil Dhu,
Knéll for the ónset.—Scott.

Whére shall the lóver rest,
Whóm the Fates séver,
Fróm his true maíden's breast,
Párted for éver ?
Whére through gróves deép and [high,
Sóunds the far bíllow ;
Whére early víolets die
U'nder the wíllow.—Scott.

O'ft have I seén the sun,
Tó do her hónour,
Fíx himself át his noon
Tó look upón her,
A'nd hath gilt év'ry grove
E'v'ry hill neár her,
Wíth his flames fróm above,
Stríving to cheér her.
A'nd when she fróm his sight
Háth herself túrned,
Hé, as it hád been night,
I'n clouds hath moúrned.
Drayton.

Three measures :—

Peáce to thee, ísle of the ócean,
Peáce to thy breézes and bíllows.—Byron.

Four measures :—

Wárriors or chiéfs, should the sháft or the swórd
Piérce me in leáding the hóst of the Lórd,
Heéd not the córpse, though a kíng 's in your páth,
Búry your steél in the bósoms of Gáth.

Thóu, who art beáring my búckler and bów,
Should the soldiers of Saul look away from the fóe,
Láy me that móment in bloód at thy feét,
Míne be the doóm that they dáre not to meét.

Fárewell to óthers, but néver we párt,
Heír to my róyalty, són of my heárt ;
Bríght be the díadem, boúndless the swáy,
Or kíngly the deáth that awaíts us to-day.—BYRON.

IV. { *Measure.*—Trisyllabic.
{ *Accent.*—On 2nd, 5th, &c., syllables.

Two measures.

Besíde her are laíd
Her máttock and spáde—
Alóne she is thére,
Her shoúlders are báre—
Ever alone
She máketh her moán.
TENNYSON.

The bláck bands came óver
The A'lps and their snów ;
With Boúrbon, the róver,
They páss'd the broad Pó.
We [have] beáten all [our] foémen,
We [have] cáptured a kíng,
We [have] túrn'd back on nó [men,
And só let us síng

" The Bóurbon for éver !
Though pénniless áll.
We 'll [have] óne more endeávour
At yónder old wáll.
With [the] Boúrbon we 'll gáther
At dáy-dawn befóre
The gátes, and togéther
Or breák or climb ó'er
The wáll: on the ládder
As moúnts each firm foót,
Our shoút shall be gládder,
[And] death ónly be múte.—
The Boúrbon ! the Boúrbon !
Sans coúntry or hóme,
We 'll fóllow the Boúrbon
To plúnder old Róme."
BYRON.

Three measures.

I 've foúnd out a gíft for my faír ;
I 've foúnd where the woód-pigeons breéd :
But lét me that plúnder forbeár ;
She 'll sáy 'twas a bárbarous deéd.

He né'er could be trúe, she avérr'd,
Who [would] rób a poor bírd of its yóung ;
[And] I lóved her the móre when I heárd
Such ténderness fáll from her tóngue.—SHENSTON.

Four measures :—

Oh húsh thee, my bábie, thy síre was a knight,
Thy móther a lády both lóvely and bright :
The woóds and the gléns and the tówers which we seé,
They áll are bélonging, dear bábie, to theé.—SCOTT.

V. { *Measure.*—Trisyllabic.
{ *Accent.*—On the 3rd, 6th, &c., syllables.

One measure :—

As ye sweép
Through the deép.—CAMPBELL.

Two measures :—

In my ráge shall be seén
The revénge of a quéen.—ADDISON.

Three measures :—

And the spárkles they flásh from their éyes !

Mixed.

See the snákes, how they réar,
How they híss in the aír,
And the spárkles they flásh from their éyes !—DRYDEN.

Four measures :—

And the kíng seized a flámbeau with zeál to destróy.
DRYDEN.

Mixed.

1.

The Assýrian came dówn like a wólf ón the fóld,
And his cóhorts were gleáming in púrple and góld:
And the sheén of their speárs was like stárs on the séa,
When the blúe wave rolls níghtly on deép Galileé.

2.

Like the leáves of the fórest when súmmer is greén,
That hóst with their bánners at súnset were seén:
Like the leáves of the fórest when aútumn is blówn,
That hóst on the mórrow lay wíther'd and strówn.

3.

For the A'ngel of Deáth spread his wíngs on the blást,
And breáthed in the fáce of the fóe as he páss'd;
And the éyes of the sleépers wax'd deádly and chíll,
And their heárts but once heáved, and for éver grew stíll.

4.

And thére lay the steéd with his nóstril all wíde;
But throúgh it there róll'd not the breáth of his príde:
And the foám of his gásping lay whíte on the túrf,
And cóld as the spráy of the róck-beating súrf.

5.

And thére lay the ríder distórted and pále,
With the déw on his brów, and the rúst on his maíl;
And the ténts were all sílent, the bánners alóne,
The lánces unlífted, the trúmpet unblówn.

6.

And the wídows of A'shur are loúd in their waíl,
And the ídols are bróke in the témple of Báal,
And the míght of the Géntile unsmóte by the swórd
Hath mélted like snów in the glánce of the Lórd.—Byron.

§. Lines or verses grouped together constitute stanzas, couplets, triplets, &c. It is only a few of the English metres that are known by fixed names. These are as follows:—

a. Common Octosyllabics.—Butler's Hudibras, Scott's poems, The Giaour, and other poems of Lord Byron.

The way was long, the wind was cold,
The minstrel was infirm and old;
His haggard cheek and tresses gray,
Seem'd to have known a better day;
The harp, his sole remaining joy,
Was carried by an orphan boy,
The last of all the bards was he
That sung of ancient chivalry.—Scott.

b. Elegiac Octosyllabics.—Same as the last; except that the rhymes are regularly alternate, and the verses arranged in stanzas.

And on her lover's arm she leant,
  And round her waist she felt it fold,
And far across the hills they went,
  In that new world which now is old:
Across the hills and far away,
  Beyond their utmost purple rim,
And deep into the dying day
  The happy princess follow'd him.—Tennyson.

c. Octosyllabic Triplets.—Three rhymes in succession. Generally arranged as stanzas.

I blest them, and they wander'd on;
I spoke, but answer came there none:
The dull and bitter voice was gone.—Tennyson.

d. Blank Verse.—Five dissyllabic measures, with accents on the even syllable, without rhyme.

All these and more came flocking; but with looks
Downcast and damp, yet such wherein appear'd
Obscure some glimpse of joy to have found their chief
Not in despair, to have found themselves not lost
In loss itself; which on his countenance cast
Like doubtful hue; but he his wonted pride
Soon recollecting with high words, that bore
Semblance of worth, not substance, gently raised
Their fainting courage and dispell'd their fears.—Milton.

e. Heroic Couplets.—Five measures, as before, with pairs of rhymes.

Strait as a line in beauteous order stood
Of oaks unshorn, a venerable wood;
Fresh was the grass beneath, and every tree
At distance planted in a due degree,
Their branching arms in air with equal space
Stretch'd to their neighbours with a long embrace:
And the new leaves on every bough were seen
Some ruddy-colour'd, some of lighter green.—DRYDEN.

f. Heroic Triplets.—Five measures, as before. Three rhymes in succession. Arranged in stanzas.

g. Elegiacs.—Five measures, as before; with regularly alternate rhymes, and arranged in stanzas.

The curfew tolls the knell of parting day,
The lowing herds wind slowly o'er the lea,
The ploughman homewards plods his weary way,
And leaves the world to darkness and to me.—GRAY.

h. Rhymes Royal.—Seven lines of heroics, with the last two rhymes in succession, and the first five recurring at intervals.

This Troilus, in gift of curtesie,
With hauk on hond, and with a huge rout
Of knightes, rode, and did her company,
Passing all through the valley far about;
And further would have ridden out of doubt.
Full faine and woe was him to gone so sone;
But turn he must, and it was eke to doen.—CHAUCER.

This metre was common with the writers of the earlier part of Queen Elizabeth's reign. It admits of varieties according to the distribution of the first five rhymes.

i. Ottava Rima.—A metre with an Italian name, and borrowed from Italy, where it is used generally for narrative poetry. The Morgante Maggiore of Pulci, the Orlando Innamorato of Bojardo, the Orlando Furioso of Ariosto, the Gierusalemme Liberata of Tasso, are all written in this metre. Besides this, the two chief epics of Spain and Portugal respectively, the Araucana and the Lusiados, are thus composed. Hence it is a form of poetry which is Continental rather than English, and naturalized rather than indigenous. The stanza consists of eight lines of heroics, the first six rhyming alternately, the last two in succession.

Arrived there, a prodigious noise he hears,
Which suddenly along the forest spread;
Whereat from out his quiver he prepares
An arrow for his bow, and lifts his head;
And lo! a monstrous herd of swine appears,
And onward rushes with tempestuous tread,
And to the fountain's brink precisely pours,
So that the giant 's join'd by all the boars.—BYRON.

j. Terza Rima.—Like the last, borrowed both in name and nature from the Italian, and scarcely yet naturalized in England.

The Spirit of the fervent days of old,
  When words were things that came to pass, and Thought
  Flash'd o'er the future, bidding men behold
Their children's children's doom already brought
  Forth from the abyss of Time which is to be,
  The chaos of events where lie half-wrought
Shapes that must undergo mortality:
  What the great seers of Israel wore within,
  That Spirit was on them and is on me;
And if, Cassandra-like, amidst the din
  Of conflicts, none will hear, or hearing heed
  This voice from out the Wilderness, the sin
Be theirs, and my own feelings be my meed,
  The only guerdon I have ever known.—BYRON.

k. Alexandrines.—Six measures; like the last, generally, perhaps always, with rhyme. The name is said to be taken from the fact that early romances upon the deeds of Alexander of Macedon, of great popularity, were written in this metre. One of the longest poems in the English language is in Alexandrines, viz. Drayton's Poly-olbion.

Ye sácred bárds that tó your hárps' melódious stríngs
Sung th' áncient héroes' deeds, the mónuménts of kíngs;
If, ás those Drúids taúght who képt the Brítish rítes,
And dwélt in dárksome gróves, there cóunsellíng with sprítes,
When thése our soúls by deáth our bódies dó forsáke,
They ínstantly agaín to óther bódies táke,
I cóuld have wísh'd your soúls redóubled ín my breást,
To gíve my vérse applaúse to tíme's etérnal rést.—DRAYTON.

l. Spenserian Stanza.—A stanza consisting of nine lines, the eight first heroics, the last an Alexandrine.

It hath been through all ages ever seen,
That with the prize of arms and chivalrie
The prize of beauty still hath joined been,
And that for reason's special privitie;
For either doth on other much rely.
For he meseems most fit the fair to serve
That can her best defend from villanie;
And she most fit his service doth deserve,
That fairest is, and from her faith will never swerve.
SPENSER.

Childe Harold and other important poems are composed in the Spenserian stanza.

m. Service Metre.—Couplets of seven measures. This is the common metre of the Psalm versions. It is also called Common Measure, or Long Measure. In this metre there is always a pause after the fourth measure, and many grammarians consider that with that pause the line ends. According to this view, the service metre does not consist of two long lines with seven measures each; but of four short ones, with four and three measures each alternately. The Psalm versions are printed so as to exhibit this pause or break.

The Lord descended from above, | and bow'd the heavens most high,
And underneath his feet He cast | the darkness of the sky.
On Cherubs and on Seraphim | full royally He rode,
And on the wings of mighty winds | came flying all abroad.

STERNHOLD AND HOPKINS.

In this matter the following rule is convenient. When the last syllable of the fourth measure in the one verse *rhymes* with the corresponding syllable in the other, the long verse should be looked upon as broken up into two short ones; in other words, the couplets should be dealt with as a stanza. Where there is no rhyme except at the seventh measure, the verse should remain undivided. Thus:—

Turn, gentle hermit of the glen, | and guide thy lonely way
To where yon taper cheers the vale | with hospitable ray—

constitute a single couplet of two lines, the number of rhymes being two. But,

Turn, gentle hermit of the dale,
And guide thy lonely way
To where yon taper cheers the vale
With hospitable ray.—GOLDSMITH.

constitute a stanza of four lines, the number of rhymes being four.

n. Ballad Stanza.—Service metre broken up in the way just indicated. Goldsmith's Edwin and Angelina, &c., from which the last stanza was an extract.

o. Poulterer's Measure.—Alexandrines and service metre alternately.

PARSING.

§. *Parse* from the Latin *per* se (by itself). It meant, originally, to take, in teaching the alphabet, each letter separately. It now means to take each *word* separately.

§. There are two kinds of Parsing—Logical Parsing and Grammatical Parsing.

§. Grammatical Parsing deals with the words which constitute sentences as so many Nouns, Pronouns, Verbs, Participles, &c., taking cognizance of them as Parts of Speech.

EXAMPLE OF GRAMMATICAL PARSING.

"The abbot on the threshold stood,
And in his hand the holy rood;
Back on his shoulders flow'd his hood."

The—Definite Article, same root as the Demonstratives *this, that.*

Abbot—Substantive Common, nominative to stood, Singular.

On—Preposition, governing *threshold.*

The—Definite Article.

Threshold—Substantive Common, Singular, Objective case, governed by *on.*

Stood—Third person, Singular, Past Tense, Indicative Mood, from the Verb stand, Intransitive, strong Conjugation.

And—Conjunction Copulative.

In—Preposition, governing *hand.*

His—Possessive Case of Personal Pronoun, Singular, third Person.

Hand—Substantive Common, Singular, Objective Case, governed by *in.*

The—Definite Article.

Holy—Adjective, belonging to *rood.*

Rood—Substantive Common, Singular.
("*Was*" is understood here.)
Back—Adverb.
On—Preposition, governing shoulders.
His—Possessive Case of the Personal Pronoun, third Person, Singular.
Shoulders—Substantive Common, Plural, Objective Case, governed by *on*.
Flowed—Third Person, Singular, Past Tense, Indicative Mood, from *flow*, a Verb, Intransitive, weak Conjugation.
His—Possessive Case of the Personal Pronoun, third Person, Singular.
Hood—Substantive Common, Singular, nominative to *flowed*.

§. *Logical* Parsing deals with the words which constitute propositions as Terms and Copulas; taking cognizance of them as Subjects or Predicates, or as parts thereof. Under this view

Man is mortal,

contains

Man	Subject.
Mortal . . .	Predicate.
Is	Copula.

For practical purposes it is useful, as well as customary, to combine the two sorts.

§. The simplest sentences are those which consist of single simple propositions; as

1. *The Sun is shining.*
2. *The Moon is shining.*
3. *The Sun is red.*
4. *The Sun is bright.*

§. Sentences like

1. *The Sun and Moon are shining;*
2. *The Sun is red and bright,*

are anything but simple; for although, when we consider them merely as sentences, they are both short and clear, they each consist of *two* propositions.

§. The simplest propositions are those that consist of the simplest terms; as

1. *Fire is burning*,
2. *Summer is coming*,
3. *Man is mortal*,
4. *I am glad*,

and the like; wherein the number of words is three—three and no more; one for the Subject, one for the Predicate, and one for the Copula.

§. The shortest propositions are not always the simplest. When each word represents either a term or copula, their grammatical elements coincide accurately with their logical, as was the case with the preceding examples. When, however, these contain fewer than three words, it is clear that either something must be supplied or that a term and copula are combined in the same word, as is the case with such expressions as

1. *Fire burns*,
2. *Summer comes*,

where *comes* and *burns* are both Predicate and Copula at once.

In such expressions as

1. *Come*,
2. *Go, &c.*,

the subject is understood.

§. The simplest propositions, then, are those that consist of what is called *single-worded* terms. Most terms, however, are *many-worded*. If it were not so, what would become of those words which, though incapable by themselves of forming a name, are still used for forming a *part* of one—words like *the*, *of*, and the like?

§. Very simple propositions can easily be converted into their opposite, as may be seen by the following operations upon the words

Fire is burning.

1. Prefix the definite article.—*The fire.*
2. Insert an adjective.—*The bright fire.*
3. Add an adverb.—*The very bright fire.*
4. Add a participle, and convert *bright* into its corresponding adverb.—*The very brightly-burning fire.*
5. Introduce a second substantive, showing its relations to the word *fire* by means of a proposition. —*The very brightly-burning fire of wood.*
6. Insert *which* after *fire*, followed by a secondary proposition.—*The very brightly-burning fire which was made this morning of wood.*
7. Add another secondary proposition relating to *wood.*—*The very brightly-burning fire which was made this morning out of the wood which was brought from the country.*
8. Add another secondary proposition by means of a conjunction.—*The very brightly-blazing fire which was made this morning out of the wood which was brought from the country, because there was a sale.*

§. It is clear that processes like this may be carried on *ad infinitum*, so that a sentence of any amount of complexity will be the result. Meanwhile, the Predicate may be made as many-worded as the Subject. Notwithstanding all this, the primary and fundamental portion of the term is manifestly the word *fire.* To this all the others are subordinate.

In like manner, the following lines from the opening of the Paradise Lost, give us but a single term, of which the word *fruit* is the fundamental element.

The *fruit*
Of that forbidden tree, whose mortal taste
Brought death into the world, and all our woe;
With loss of Eden, till one greater Man
Restore us, and regain the blissful seat.

§.

EXAMPLE OF LOGICAL PARSING.

1. *The way was long.*
   - A. Essential part of the Subject—*way.*
   - B. Predicate—*long.*
   - C. Copula—*was.*
   - D. Subordinate part of the subject—*The*, Definite Article.

2. *The wind was cold.*
   Essential part of Subject—*wind.*
   Predicate—*cold.*
   Copula—*was.*
   Subordinate part of Subject—*The*, Definite Article.

3. *The minstrel was infirm.*
   Essential part of Subject—*minstrel.*
   Predicate—*infirm.*
   Copula—*was.*
   Subordinate part of Subject—*The*, Definite Article.

4. *And.*
   Conjunction belonging to no proposition at all; but connecting the one which has just preceded with the one that follows.

5. *The minstrel was old.*
   Essential part of Subject—*minstrel.*
   Predicate—*old.*
   Copula—*was.*
   Subordinate part of Subject—*The*, Definite Article.

These two propositions have been given *in extenso*. The compendious form of them is

The minstrel was infirm and old.

6. *His haggard cheek seem'd to have known a better day.*
   Essential part of Subject—*cheek.*
   Predicate—*seemed.*
   Copula—involved in *seemed.*
   Subordinate part of the Subject—*His*, Possessive case of *he.* It means—*the minstrel's.*
   Haggard—Adjective.
   Subordinate parts of the Predicate—
   Known—Past Participle from *know.*
   Have—Infinitive Verb.
   To—Preposition.

Day—Substantive.
Better—Adjective in the Comparative Degree. No Positive form. Its place supplied by *good*.
A—Indefinite article. *A* form of *an*. The *-n*, however, is omitted, because the word that follows begins with a consonant.

The subordinate parts of this Predicate are all connected. Theoretically the sense is *to possess a better day as a known thing*—in which case *known* is, virtually, in the accusative case and the Neuter Gender. The grouping is

to have known | *a better day*

7. *And.*
Conjunction; included in no proposition, but connecting two.
8. *His tresses gray seem'd to have known a better day.*
Compendiously, these two propositions run

His haggard cheek and tresses gray,
Seem'd to have known a better day.

9. *The harp was carried by an orphan boy.*
Essential part of Subject—*harp.*
Predicate—*carried.*
Copula—*was.*

10. ——————— *his sole remaining joy,*
Was carried by an orphan boy.

Here *joy* is in apposition to *harp;* and in some sense, is as true a Subject as the word *harp* itself.

11. *The last of all the bards was he.*
Copula—*was.*

He, though following the Copula, seems to be the Subject. At any rate in prose the expression would be—

Subject	*Copula*	*Predicate*
He	*was*	*the last of all the bards.*

12. *Who sang of ancient chivalry.*
Subject—*who:*

a relative pronoun meaning the same as *he*, its antecedent. It has no meaning of its own. Neither has *he*. It might mean a *king*, *hero*, *horse*, or anything of the Masculine gender. In the particular instances before us it means *bard* or *minstrel*. These substantives are *its* antecedents just as it is, itself, the antecedent of *who*.

The passage, as it stands in Scott, runs thus:—

The way was long, the wind was cold,
The minstrel was infirm and old,
His haggard cheek and tresses gray
Seem'd to have known a better day.
The harp, his sole remaining joy,
Was carried by an orphan boy.
The last of all the bards was he
Who sang of ancient chivalry.

The Lay of the Last Minstrel.

§. In propositions like—

Great is Diana of the Ephesians,

the order of terms is reversed, and the Predicate precedes, instead of following, the Copula. Expressions of this kind, *in declaratory propositions*, are, more or less, rhetorical.

§. In propositions like—

What is that?

this transposition is the rule, rather than the exception.

Subject—*That.* A Demonstrative Pronoun in the neuter gender, denoting some unknown object to which the speaker is directing attention—perhaps pointing. The *-t* is the *-t* in *i-t* and wha-*t*, and is the sign of the neuter gender.

Copula—*Is.*

Predicate—*What.* An Interrogative Pronoun; also neuter. The Proposition being interrogative, the Predicate and Subject change places.

For *that* write *this*, and the object concerning which the inquiry is made is brought nearer.—*What is this?*

For *that* write *yon*, and it is removed to a greater distance—*What is yon?*

All these distances, however, are comparative. The object expressed by *that* may be near enough to be touched by the finger, or it may be all but out of sight.

§.

Where are you?

Subject—*You.*
Copula—*are.*
Predicate—*where.* This word, though in many respects an Adverb, forms *by itself* a term. It is equivalent, however, to *in what place;* a phrase in which we have a Substantive and something more. In like manner, *here I am = I am in this place.*

§.

When did you see him?

Subject—*You.*
Essential part of Predicate—*see.*
Copula—involved in Predicate.

When = at what time?

§. In propositions like—

Beware,
Go,
Walk,
Speak, &c.,

the subject is the person or object spoken to. But as this is easily understood, the Pronoun *thou* (or *ye*) is omitted. It constitutes, however, the subject. It is generally treated as a Nominative Case. Strictly speaking, it is a Vocative.

§. All the preceding Propositions are clearly and decidedly (1) Declaratory; (2) Interrogatory; or (3) Imperative—conveying (1) Assertions; (2) Questions; or (3) Commands.

§. The following are in a somewhat different predicament.

§.

May you be happy.

Subject—*You.*

Copula—*be.*

Predicate—*happy.*

Sentences of this kind are called Optative, from the Latin word *opto = I wish.* By more than one good authority, they are placed in a class by themselves as a third species of Proposition. And it cannot be denied that they are expressions of a peculiar character.

Would I could.

This is also optative, meaning *I wish I could*, or more fully.

I wish
that
I could.

Such being the case, we have two propositions conveyed by three words. There is the omission of the conjunction *that;* and (more remarkable) that of the Personal Pronoun as well.

§.

How well you look.

Subject—*You.*

Predicate—*look.*

Copula—involved in Predicate.

Sentences of this kind convey an exclamation of surprise, and have been called Exclamatory.

Optative Propositions are, to a certain extent, Imperative, and, to a certain extent, Declaratory. In expressions like

May you be happy,

change the place of *may* and *you*, the result is an ordinary assertion,

You may be happy.

On the other hand,

You be happy

is a command. There is no command, however, without a real or supposed wish on the part of the speaker.

Exclamatory Propositions are, to a certain extent, Interrogative, and, to a certain extent, Declaratory.

In expressions like

How well you look,

change the place of the essential parts, and the result is an ordinary assertion,

You look well.

Meanwhile, *how* indicates the degree or extent of your well-looking. But it only *indicates* it. The degree itself is undefined; and (as such) the possible object of a question.

How do you look?

is an actual Interrogation.

PUNCTUATION,

derived from *punctum* (Latin), a point. It means the putting of points or stops to represent to the eye the pauses made by the voice in reading or speaking. These pauses differ in length, and are therefore represented by different kinds of stops.

There are four different kinds of stops — the Comma—the Semicolon—the Colon—the Period.

I.—THE COMMA

separates parts or members of a sentence, which, though closely connected in sense and in construction, require some short pause between them. The proper use of the comma can only be known by practice and by attention, but there are some general rules to be observed.

1. When a parenthetical, relative, or explanatory clause is introduced, a comma should generally be placed before and after it; as—

"My brother, fearing your displeasure, begged me to apologize for this delay."

"These gentlemen, who live in the country, have brought me some flowers."

2. When a person, or an object, is addressed, a comma should be placed after the name of the person or object, as—

"Mary, give me your book."
"Friends, countrymen, I appeal to you."
"Fond hope of many nations, art thou dead?"

3. The case absolute, and the infinitive mood absolute, should generally be separated by commas from the other parts of the sentence—

"His father dying, he succeeded to the estate."
"To confess the truth, I forgot it."

4. Words in apposition, when they are accompanied by adjuncts, require to be separated by commas, as—

"Augustus, the first Roman Emperor, who succeeded Julius Cæsar," &c., &c.
"I, Henry, king of Great Britain and defender of the faith, do hereby proclaim," &c., &c.

5. Adverbs, and adverbial phrases, in many instances, need to be separated by commas from the sentence to which they belong, as—

"His conduct is, in many respects, very unsatisfactory."
"Finally, the great source of all this evil must be looked for," &c.
"Besides, I do not know his address."

6. Three or more nouns, adjectives, verbs, or adverbs, following one another, must be separated by commas: also *two* words of any of these parts of speech when the conjunction is omitted, as—

"Her time is fully occupied with music, drawing, and the study of languages."
"He is a brave, energetic, active person."
"Hopes, fears, joys, sorrows, succeed one another like passing hues."
"You must read, mark, learn, and digest this book."
"Duty, inclination, alike compel me to it."

7. In elliptical construction, commas are used to mark the ellipsis, as—

"My brother likes him a little; my father, still less; and my uncle, not at all."
"To one person is given the talent of speaking; to another, facility in writing; to another, the power of retaining what he hears."

8. Sentences in which contrast or opposition is expressed, require the use of commas, as—

"Though slow, yet sure: though tardy, yet welcome."

"Patience arises from, and points to, the hope of a better future."

9. To mark emphasis, commas are sometimes used, as—

"To you, you alone, will I entrust this mission."
"Strange, strange indeed, is the perversity of human nature."

The often-quoted suggestion of marking a comma by a pause sufficiently long to count *one;* a semicolon, by counting *two;* a colon, by counting *three;* and a period, by *four*, is not to be taken as a rule, yet it serves to show the relative value of the stops.

In reading, there is a pause which is less than a comma, and is not expressed in writing: it is called in prose, the rhetorical pause; in poetry, the cæsural pause.

II.—THE SEMICOLON

is used for dividing clauses which are less closely connected than those separated by commas. When one clause is complete in itself, both as to sense and construction, and another clause is added by way of inference or explanation, a semicolon is placed between the two. Also when a sentence is composed of many clauses, each clause being in itself complete, yet in some way depending on the other parts of the sentence, the clauses are separated by semicolons, as—

"Very frankly he confess'd his treasons;
Implored your highness' pardon; and set forth
A deep repentance; nothing in his life
Became him like the leaving it; he died
As one that had been studied in his death."

Shakespear.

III.—THE COLON

is used to divide a sentence into two or more parts,

where there is less connection between them than between those separated by a semicolon, as—

"Sit, worthy friends: my lord is often thus,
And hath been from his youth: pray you, keep seat:
The fit is momentary," &c. *Shakespear.*

IV.—THE PERIOD, OR FULL STOP,

is used when a sentence is as complete as it is intended to be, both in construction and in sense.

The Note of Interrogation (?) and the Note of Admiration (!) are but varieties of the Period, and are used when the turn of the sentence requires to be thus marked. When a question is asked, the note of interrogation is used. When there is an expression of emotion, the note of exclamation is used.

It remains to notice the Dash, the Parenthesis, and the Marks of Quotation.

The Dash is used either to express a sudden and abrupt breaking off of the sentence, or a long and emphatic pause, as—

"Up, up, and see
The great doom's image.——Malcolm! Banquo!"
&c., &c.
"Till then, enough.——Come, friends."—*Shakespear.*

The Marks of Parenthesis ( ) enclose some clause inserted into a sentence, which could be omitted without injury to the sense or construction, as—

"Tell me (if your art
Can tell so much) shall Banquo's issue ever
Reign in this kingdom?" *Shakespear.*

The Quotation Marks " " are used to mark a passage quoted from some other writer or speaker, as—

His words were, "Come quickly."

EXERCISES.

1. Make a list of the names of villages ending in *by* in the following counties :—Lincoln, York, Leicester, Northampton, Nottingham, Derby, Lancashire, Cheshire, Norfolk, Suffolk. Observe in what proportion they occur elsewhere.

2. Give a list of twenty monosyllables where the vowel-sound is that of the *a* in *fate*, ten of which shall end in *-e* (as *ale*), and ten contain the letters *ai*, as *ail*.

3. Give a list of ten words like *seat*, where the sound of *ee* is expressed by *ea*.

4. Frame five propositions, each consisting of three words ; five, consisting of two ; five, consisting of only one.

5. Write down twenty words capable of forming, by themselves, either a Subject or a Predicate.

6. Write down twenty words capable of forming Predicates, but not capable of forming Subjects.

7. Write down twenty words capable of forming both Predicate and Copula.

8. Write down ten proper names, five of persons, and five of places. Also ten abstract names, with their corresponding adjectives.

9. Write down three Compound words beginning with and three ending with *day*. Also three compounds like *midshipman*, containing more than two elements.

10. Form derived words from the following : *wise*, *happy*, *man*, *love*, *hunt*, *gird*, *gold*, *thrive*, *shrive*, *goose*, *drink*, *lamb*, *hill*, *craft* ; stating in each instance what part of speech the word is.

11. Take a page from some good author and write down all the pronouns it contains. By the side of each, write the substantive for which it stands.

12. Take a page from some good author, make a list of all the substantives contained in it, and give their Plurals.

13. Give the Possessive Plurals of *child*, *man*, *fox*, *wife*, *dog*.

14. Take a page of any good author, and write down all the adjectives it contains, giving their Comparative and Superlative degrees.

15. Make a list of words ending in *-most*.

16. Take a page of some good author, and write down the verbs it contains, naming, if possible, the corresponding verbals.

17. Make a list of ten transitive, and ten intransitive verbs.

18. Give the Past Tense of the following verbs: *fall*, *hold*, *blow*, *draw*, *heat*, *cleave*, *shake*, *give*, *arise*, *swim*; also their Participles.

19. Convert *sweet*, *brave*, *strong*, *wise*, *odd*, into their corresponding adverbs. Make a list of twenty adverbs ending in *ly*.

20. Give three examples of an adverb in the Comparative Degree, and three of one in the Superlative.

21. Take a page from some good author, and write down the adverbs it contains; also the Prepositions, Conjunctions, and Interjections.

22. Construct ten Sentences, in each of which there shall be a Collective Substantive.

23. Give ten convertible words, such as *black*, used as *adjectives* and as Substantives.

24. Place the Indefinite Article before the following words: *man*, *boy*, *woman*, *heir*, *hand*, *ox*, *day*, *unit*, *well-wisher*, *ewer*.

25. Insert the apostrophe, when needed, near the final *s* in *ships*, in the following:—

This ships sail.
These ships are sailing.
These ships sails.

26. Explain the construction of *I have written a letter*.

27. Construct a sentence in which *in* is a Preposition; another sentence in which it is an *adverb*. Do the same with *on* and *through*.

28. Write down under each of the following words three rhymes: *old*, *man*, *steal*, *master*, *breezes*, *leading*, *willow*, *fortify*, *hardiness*, *charity*.

29. An exercise on Punctuation may be given by dictating a passage from any good author, taking care to indicate no stops, and requiring the pupil to put them afterwards, and to give the reasons in each instance.

30. An exercise in *Prosody* may be given by selecting passages to be scanned or marked according to the rules and measures given.

FOR PARSING.

I have no gold nor silver.
I wish you to hope against hope.
He went on all fours.
The assembly was convened.
The parliament is prorogued.
The multitude were easily pacified.
The gang was large.
He asked an alms.
These alms are valuable.
His great bane is his riches.
Riches fly away quickly.
My means are small.
Ill news fly apace.
This is bad news.
Do not spare your pains.
All my pains are fruitless.
I called on the Miss Browns.
To forgive is divine.
This field is ours.
This is our field.
This is my garden.
This garden is mine.

The child pined for its home.
They say it happened last week.
One longs to be able to do more.
One might expect more progress.
There is no chance of her coming.
There are many impostors.
It snows fast.
I will lay me down.
I will keep myself warm.
Take care of yourselves.
He laughed himself hoarse.
You yourself saw it done.
The thing itself is impossible.
This is the better of those books.
I have seen your house.
I had spoken to your cousin.
I have slept well.
I have travelled a great deal.
I have selected a horse.
He has asked his brother.
I command them.
You eat very often.
He sleeps in town to-night.
Will you dance?
I danced the quadrilles.
I am trying to see my way.
He is hoping to go out soon.
Either you or I is in the wrong.
Either she or we are right.
Would they had stayed!
Speed we on our way!
Wait till I come.
He longs for a less trying life.
To go so far is dangerous.
He was writing when I called.
Let us go quickly.
Come without fail.
He jumped over the hedge.
I cannot see through the mist.
They are behind the wall.
They attacked from behind.
See them all pass by.
It is by the door.
He, who spoke, is the leader.
I have done what you advised.
You are taller than me.
You are taller than I.
Ere yet the sun had risen.
It is all but dark.
All fled but John.
I saw all but James.
You may go, but not I.
He spoke, not of you, but me.
He climbs up the tree.
I am coming up.
They are climbing up.
Go down.
It is down-stairs.
He ran round the tree.
You are wiser than I.
This is said to be like me.
The one is like the other.
It weighs a pound.
From whence do you come?
I come from thence.

Salt meat is good when the salt with which it is salted is well rubbed in.

I will ice the cream if you will bring some ice from the ice-house.

How can you light this room? I think it will be light enough if we have twelve lights burning.

He always answers with ifs and buts.

Take that silver vase to the silversmith to be re-silvered.

Do you prefer a gold to a silver pencil-case?

He would have all sweets and no bitters.

I have not met her this five years.

Riches are sometimes a great blessing.

It is the only means I can suggest.

He is willing to make amends for his fault.

My gardens, they cost me several hundreds a year.

The minister, he made a long speech last night.

Adrian the fourth, the first English pope, is the person to whom you refer.

The same may be said of all the King Georges.

Direct your letter to the Misses Evans.

To hesitate is to decide in this case.

We must not forget the Newtons and Bacons, the Herschels and Brewsters, in pursuing those studies.

Is this your book? No: it is yours.

I do not think this is his house. Yes: it is his.

One often speaks without thinking.

There is no one whom I honour as I do that man.

It is tiresome to be kept waiting so long.

It is to be hoped that he will soon come.

The banker and the clerk have been here.

The manager and inspector has called to-day.

The last two weeks have passed quickly.

The two last pupils in the class did not answer.

Put me down at Smith and Robson's.

I am going to Chatsworth, the seat of the Duke of Devonshire.

You must go to the Isle of Wight, the garden of England.

Lord Macaulay, the great historian, died lately.

I shall have written my letter when you come.

I should have tried to meet you, had I thought you would be there.

We generally walk six miles a day.

Although it is late, I have waited for you.

Although it be late, I will not fail.

If he is gone, I must follow him.

I wrote that account that you might be satisfied.

I come that you may hear all my story.

I have given you that book that you may have no excuse for ignorance.

I had hoped that he would mend his ways.

Would that thou wert more consistent.

A king or queen always rules in England.

A sovereign or supreme ruler always rules in England.

Either he or they will attend to you.

Neither my brother nor myself was there.

The offender must be punished, whoever he be.

I saw him! a living, breathing, feeling man.

I come in hopes of persuading you; but I fear you will not be persuaded.

I fear to speak. Dare you speak?

Methinks it is but a sadly poor prospect.

Quiet, strong characters are the hope of the times.

The man, whom I saw, was very tall and dark.

Who fears to own himself in the wrong, is a greater coward than he who dreads the tempest.

The lady to whom I spoke is my cousin.
He, whose heart is true, fears nothing.
It is I, your leader, who call you on to great deeds.
The day I have hoped for is come.
I think your plan is clever and excellent, except the one part of it, to which I objected yesterday ; but I trust to you to remedy this, because your character is at stake.
The children dance round and round.
It is standing-up time at his school.
If the sun shine, the day will be clear.
If you are ready, I will come directly.
I will stay as long as you like.
The door being open, the horse was stolen.
What is the cause of that man's walking so slowly ?
What is the reason of that girl singing so hoarsely ?

Come what, come may,
Time and the hour wear through the roughest day.—SHAKESPEAR.

Give me back him I love
From his stern will relenting.
But first and chiefest, with thee bring,
Him that high soars on golden wing.—MILTON.

But come, thou goddess fair and free,
In Heaven yclept Euphrosyne,
And, by men, heart easing Mirth.—MILTON.

Where you are liberal of your loves and counsels,
Be sure you be not loose ; for those you make friends,
And give your hearts to, when they once perceive
The least rub in your fortunes, fall away
Like water from ye, never found again
But when they mean to sink ye.—SHAKESPEAR.

Mark but my fall, and that that ruin'd me ;
Cromwell, I charge thee, fling away ambition ;
By that sin fell the angels ; how can man then,
The image of his Maker, hope to win by 't ?
Love thyself last ; cherish those hearts that hate thee,
Corruption wins not more than honesty.—SHAKESPEAR.

Whose mind is but the mind of his own eyes,
He is a slave—the meanest we can meet !—WORDSWORTH.

Sweet Heaven forfend ! his was a lawful right
Noisy he was, and gamesome as a boy ;
His limbs would toss about him with delight,
Like branches when strong winds the trees annoy.
WORDSWORTH.

If plants be cropt, because their fruits are small,
Think you to thrive, that bear no fruit at all.—QUARLES.

QUESTIONS FOR EXAMINATION.

ON THE HISTORY OF THE ENGLISH LANGUAGE.

1. To what great class of languages does the English belong?
2. Name the different forms of the language which are brought before us in studying the history of England.
3. When and how was the Latin language introduced into our country?
4. When and how was the English language introduced into Britain?
5. Explain the term *Anglo-Saxon?*
6. What is the origin of the word Wales?
7. What traces do we find in our language of the Danish invasion?
8. What language was introduced by the battle of Hastings, and how long was it spoken in this island?
9. Give some particulars of the changes in our language from the time of the Norman Conquest till the time of the Reformation.
10. Give some details of the spread of the English language in the Western Hemisphere.
11. In the Eastern Hemisphere, where is the English language spoken?

ORTHOGRAPHY AND ORTHOËPY.

12. What are the first subjects that come under consideration in studying Grammar?
13. Define *orthography*, and *orthoëpy*.
14. Why do not the orthography and orthoëpy of our language agree?
15. How many elementary sounds are there in English? Give instances of each.
16. What is a *syllable?* What are the different classes of words, as regards their syllables?
17. Why are these words *miss*, *butt*, or *less*, spelt with the repetition of the final consonant?
18. What is *accent?*
19. Give instances in which accent is distinctive.

PROSODY.

20. What is prosody?
21. What position does *accent* occupy in prosody?
22. How do you measure the length of a verse?
23. What is a *measure* in poetry?
24. What is *blank verse?*
25. Give an instance of couplet rhymes.
26. Give an instance of alternate rhymes.
27. What are the necessary conditions of words rhyming to one another?
28. Give an instance of single rhyme.
29. Give an instance of double rhyme.
30. Give an instance of treble rhyme.
31. Explain and illustrate the *Heroic measure.*
32. Explain and illustrate the two classes of blank verse.

ETYMOLOGY.

33. What is the meaning of the word etymology? of what does it treat?
34. What are the different ways in which changes are effected in words? Give instances.
35. Name the English parts of speech.
36. What is a proposition? How many kinds of propositions are there? Give instances.
37. Of what parts does a proposition necessarily consist?
38. Explain and illustrate the meaning and office of each of these parts.
39. Explain the difference between proper and common names. Also between variable and invariable names.
40. In how many ways are English names variable?
41. What is *Case?* How many cases are there in English?
42. What is a Pronoun? What is its place in a proposition?
43. Of what varieties are pronouns susceptible?
44. Name the different classes of pronouns. Give an instance of each.
45. Draw out a table of all the English pronouns, giving all their inflections.
46. Explain the difference between the true personals and the demonstratives which serve as personals.
47. Explain the difference between personal and possessive pronouns.
48. Explain the difference between interrogative and relative pronouns.
49. What have you to say as to the affinity between *who* and *which?*
50. What are the two divisions of the *numerals?*

51. What is there to observe on the word *self*?

52. Give the derivation of "*Article.*" Mention the English Articles.

53. What is a *Substantive*?

54. In what points does it agree with, and in what does it differ from, a pronoun?

55. What expressions of *gender* do substantives give?

56. What inflections of *case* have substantives?

57. Give the general rules for forming the plural of English substantives.

58. Explain and illustrate the term *collectives*.

59. What is the etymology of the words *alms* and *riches*?

60. How do you form the possessive case in the singular? How in the plural?

61. What is an adjective? What connection has it with the substantive?

62. What are degrees of comparison, and how are they formed?

63. Give the etymologies of the words *more*, *nether*, *near*, *farther*, *further*.

64. Give instances of double superlatives.

65. Explain what are abstract *substantives*. Show the fitness of the term *abstract* in this case.

66. What are verbals? What are their endings, and what do these endings denote?

67. What is a verb? and what is its power in a proposition?

68. What is a participle?

69. What words give the *copula* in a proposition?

70. How many kinds of actions are expressed by verbs? and what are they?

71. Mention some transitive verbs from which intransitives can be formed.

72. In what way can a verb be declined?

73. What difference is there in the present English from the Anglo-Saxon as to the declension of verbs, adjectives, and participles?

74. What do you mean by the conjugation of a verb?

75. Name the moods, and their distinctive features and signs.

76. How many tenses are there?

77. What are the two ways of forming the past or preterite?

78. Name the participles and their endings.

79. How far is there similarity between the past tense and the past participle?

80. In verbs, whose past tense is formed by changing the vowel, how is the past participle generally formed?

81. Give the etymology and meaning of the word *yclept*.

82. In verbs which admit two forms of preterite, how is the participle formed?

83. What are the inflections of *be*?

84. What are the inflections of *am*?
85. What are the inflections of *was*?
86. What is there to observe with respect to the ordinary arrangement of the verb *to be* as an irregular verb?
87. What confusion is commonly made between the verbs *lie* and *lay*?
88. Give instances of *dare* as an intransitive and as a *transitive* verb.
89. What are the etymologies of *own*?
90. Why are *would*, *should*, and *could*, written with an *l*?
91. Why is the *g* inserted in *might*?
92. What different meanings and etymologies has *do*?
93. How would you parse *quoth*?
94. How are adjectives changed into adverbs? What is the meaning of the syllable which forms so common a termination of adverbs?
95. Give the etymology of *eftsoons*.
96. What are *seldom* and *whilom*?
97. Give an instance of an adverb ending in *ling*.
98. Give the etymologies of *here*, *where*, *then*, *there*, *when*.
99. What inflection do adverbs take?
100. Give the etymology of *rather*.
101. Which are the parts of speech destitute of inflection?

DERIVATION.

102. Give instances of derivation by the addition of a vowel.
103. Mention the several letters which we find used as additions in derived words, and give an instance in each case.
104. Mention the syllables used as additions in derived words.
105. What class of words is derived from the Anglo-Saxon ending *ere*?
106. What fact is generally expressed by words ending in *en*?
107. Give the etymologies of *main*, *tight*, *uncouth*, *burthen*, *eyrie*.

COMPOSITION.

108. Write out instances of compound words, naming in each instance the parts of speech used to form the word.

SYNTAX.

109. Of what does Syntax treat?
110. In cases where it is difficult to distinguish between two separate words and a compound word, what test may be applied? Give instances.

111. What connection is there between the etymology and the syntax of a language?

112. Explain the meaning of *convertibility* as applied to the English language.

113. Explain what is meant by *Logical* Parsing.

114. What is Etymological Parsing?

115. Which are the two most important terms in Syntax?

116. What is *Concord?*

117. What is *Regimen?*

118. In dealing with collectives, how would you decide whether to use the *singular* or the *plural* of the verb?

119. Why do we treat of the pronoun before other parts of speech, both in Etymology and in Syntax?

120. Why, in parsing "*his father*," would you call "*his*" a possessive case of a personal pronoun, and not a possessive pronoun?

121. Give further illustration of the difference between personal and possessive pronouns.

122. Give instances of the indeterminate use of pronouns.

123. What is the construction of "*there*" and of "*it*," in such expressions as "There is no time," "It rains," "It snows"?

124. When do you use the article *an*, and why is it called *indefinite?*

125. When is it necessary to put the article before every substantive?

126. What is the construction of *myself*, *thyself*, *ourselves*, *yourselves?*

127. What is the construction of *himself*, *themselves?*

128. What is the difference between the *two first* and the *first two?*

129. What does the possessive case imply?

130. Give instances of the position of the possessive case in sentences.

131. Give instances of substantives in a state of government.

132. Give instances of substantives in apposition.

133. What are the rules for substantives in apposition?

134. Name the chief points in the Syntax of the degrees of comparison of adjectives.

135. Explain and give instances of *Pleonasm.*

136. Which is the only adjective that governs a case?

137. In what respects is the Syntax of participles and adjectives alike?

138. When the participle is combined with an article, in what case is it?

139. When the participle is combined with *have*, in what case is it?

140. Prove the correctness of this construction, by deduction from other languages.

141. In what respect is the Syntax of the participle coincident with the syntax of the verb?

142. In the sentence, "I am thinking," is the participle more of an *adjective* or of a *verb* as to its Syntax?

143. What are the connecting lines between substantives and verbs?

144. Show that verbs are susceptible of declension.

145. What are the points to be considered in the Syntax of verbs?

146. When is there a question of *Mood?*

147. Name the Moods. Give the derivation of their names; and instance each of them.

148. What is the syntax of the imperative mood?

149. What is the chief rule as to the infinitive mood?

150. What are the affinities between *Time* and *Tense?* What the discrepancies?

151. "I was speaking when he entered,"—how do you explain the use of the *present* participle, "*speaking*," when the sentence refers to *past* time?

152. Explain the mixture of past time and present in such expressions as "I have ridden," "I have spoken."

153. How is the future tense formed?

154. Explain the term *auxiliary* as applied to *verbs.* Give instances.

155. Under what circumstances may the subject of a verb be omitted?

156. Explain the expressions *methinks, meseems, melisteth.*

157. What observations may be made on the distinction between *shall* and *will?*

158. Give instances in which the subject and predicate need not agree in *number.*

159. What case follows the transitive verb?

160. Why must a transitive verb be followed by a substantive or pronoun?

161. Explain fully the difference between transitive and intransitive verbs.

162. Give instances of the same verb being used both in a transitive and intransitive sense.

163. How do adverbs enter into the composition of sentences?

164. Under what different classes or groups can adverbs be arranged?

165. How can you account for an objective case sometimes following an intransitive verb?

166. What do you mean by the *case absolute?*

167. What is the office of a preposition in a sentence?

168. What is the great distinction between adverbs and prepositions? Illustrate by example.

169. What is the construction of "This is a house of my father's"?
170. What is the construction of "The king of Saxony's army"?
171. What do you mean by a *complex* sentence? Give an instance.
172. Explain the terms *relative* and *antecedent*.
173. What are the two great rules for the relative and antecedent?
174. Give an instance of ellipsis of the relative.
175. Give a sentence in which the antecedent is *subjective*.
176. Give a sentence in which the antecedent is predicative.
177. When can the relative be expressed by *what*?
178. What is the office of *conjunctions*?
179. Analyze an apparently single sentence into its two propositions.
180. Why is the syntax of conjunctions difficult?
181. What is a *copulative* conjunction? What a *disjunctive*?
182. How is the idea expressed by a conjunction sometimes strengthened?
183. Name and instance the other kinds of conjunctions which denote the dependence of one act on another.
184. What is the rule for the *number* of the verb following conjunctions?
185. "I do this that I may succeed"—what rule is here illustrated?
186. What conjunctions govern the subjunctive mood? Give instances.
187. What is the construction of *as* and *than* in the following sentences—"Be so kind as to come here," "This is better than that"?
188. Give instances of *but* as an adverb, as a preposition, and as a conjunction.
189. In what number is the verb when preceded by two or more nouns connected by a conjunction?
190. In what number is the verb when preceded by two or more nouns connected by a copulative conjunction?
191. What is the great difference between a conjunction and a preposition in construction?
192. What is the position of the *negative* with respect to the verb?
193. What is the construction of two negatives?
194. What do you mean by "a question of appeal"?
195. What do you mean by "a categorical question"?

ENGLISH GRAMMAR

FOR

CLASSICAL SCHOOLS.

PART I.—HISTORY.

Distribution of the English Language over the British Isles.

§ 1. THE English language is spoken generally throughout all the counties of England.

§ 2. The English language is spoken in Wales, *partially*; *i. e.* in the principality of Wales there are two languages, the English and the Welsh as well.

How far the Welsh differs from the English may be seen from the following specimens:—

Parts of the human body.

English.	*Welsh.*	*English.*	*Welsh.*	*English.*	*Welsh.*
Head	Pen.	*Teeth*	Dannedd.	*Arm*	Braich.
Hair	Gwallt.	*Tongue*	Tafod.	*Hand*	Llaw.
Eye	Llygad.	*Ear*	Clust.	*Leg*	Coes.
Nose	Trwyn.	*Back*	Cefn.	*Foot*	Troed.
Mouth	Ceg.	*Blood*	Gwaed.	*Nail*	Ewin.

Names of animals.

Horse	Ceffyl.	*Lamb*	Oen.	*Goose*	Gwydd.
Cow	Buwch.	*Goat*	Gafr.	*Crow*	Brân.
Calf	Llo.	*Dog*	Ci.	*Bird*	Adar.
Sheep	Dafad.	*Fox*	Llwynog.	*Fish*	Pysg.

Numerals.

One	Un.	*Five*	Pump.	*Nine*	Naw.
Two	Dau.	*Six*	Chwech.	*Ten*	Deg.
Three	Tri.	*Seven*	Saith.	*Twenty*	Ugain.
Four	Pedwar.	*Eight*	Wyth.	*Hundred*	Cant.

§ 3. The English language is spoken in Scotland, *partially*; *i. e.* in the northern and in the western counties there are two languages, the English, and the *Scotch* Gaelic as well.

Parts of the human body.

English.	*S. Gaelic.*	*English.*	*S. Gaelic.*	*English.*	*S. Gaelic.*
Head	Ceann.	*Tooth*	Fiacal.	*Arm*	Gairdean.
Hair	Folt.	*Tongue*	Téauga.	*Hand*	Lamh.
Eye	Stúil.	*Ear*	Duas.	*Leg*	Cos.
Nose	Sron.	*Back*	Druim.	*Foot*	Cos.
Mouth	Beul.	*Blood*	Fuil.	*Nail*	Iongna.

Names of animals.

Horse	Each.	*Lamb*	Nan.	*Goose*	Geodh.
Cow	Bo.	*Goat*	Gabhair.	*Crow*	Fiannog.
Calf	Laogh.	*Dog*	Cu.	*Bird*	Eun.
Sheep	Caor.	*Fox*	Sionnach.	*Fish*	Iasg.

Numerals.

One	Don.	*Five*	Cuig.	*Nine*	Naoi.
Two	Dha.	*Six*	Se.	*Ten*	Deig.
Three	Tri.	*Seven*	Seachd.	*Twenty*	Fichead.
Four	Ceathar.	*Eight*	Ochd.	*Hundred*	Ceud.

§ 4. The English language is spoken in Ireland, *partially*; *i. e.* in Ireland there are two languages, the English, and the *Irish* Gaelic as well.

Parts of the human body.

English.	*I. Gaelic.*	*English.*	*I. Gaelic.*	*English.*	*I. Gaelic.*
Head	Cean.	*Tooth*	Fiacail.	*Arm*	Gairdean.
Hair	Folt.	*Tongue*	Teanga.	*Hand*	Lamh.
Eye	Súil.	*Ear*	Duas.	*Leg*	Cos.
Nose	Sron.	*Back*	Druim.	*Foot*	Cos.
Mouth	Beul.	*Blood*	Fuil.	*Nail*	Iongna.

Names of animals.

Horse	Fach.	*Lamb*	Uan.	*Goose*	Geodh.
Cow	Bo.	*Goat*	Gabhair.	*Crow*	Feannog.
Calf	Laogh.	*Dog*	Cu.	*Bird*	Ean.
Sheep	Caor.	*Fox*	Sionnach.	*Fish*	Iasg.

Numerals.

One	Aon.	*Five*	Cuig.	*Nine*	Naoi.
Two	Do.	*Six*	Sé.	*Ten*	Deich.
Three	Trí.	*Seven*	Seacht.	*Twenty*	Fitche.
Four	Ceathar.	*Eight*	Ocht.	*Hundred*	Ceud.

§ 5. The English language is spoken in the Isle of

Man, *partially; i. e.* in the Isle of Man there are two languages, the English, and the Manks as well.

Parts of the human body.

English.	*Manks.**	*English.*	*Manks.*	*English.*	*Manks.*
Head	Kione.	*Tooth*	Feeackle.	*Arm*	Clingan.
Hair	Folt.	*Tongue*	Chengey.	*Hand*	Lave.
Eye	Sooil.	*Ear*	Cleaysh.	*Leg*	Cass.
Nose	Stroin.	*Back*	Dreem.	*Foot*	Cass.
Mouth	Beeal.	*Blood*	Fuil.	*Nail*	Ingin.

Names of animals.

Horse	Agh.	*Lamb*	Eayn.	*Goose*	Guiy.
Cow	Booa.	*Goat*	Gonyr.	*Crow*	Feeagh.
Calf	Lhery.	*Dog*	Coo.	*Bird*	Eean.
Sheep	Keyrrey.	*Fox*	Shynnagh.	*Fish*	Eeast.

Numerals.

One	Unnane.	*Five*	Queig.	*Nine*	Nuy.
Two	Daa.	*Six*	Shey.	*Ten*	Jeih.
Three	Tree.	*Seven*	Shiaght.	*Twenty*	Feed.
Four	Kiare.	*Eight*	Hoght.	*Hundred*	Keead.

§ 6. The English language is spoken in the United States of America, in Canada, in Australia, and, more or less, in all the English colonies and dependencies.

The extension of the English language *beyond* the British Isles is a recent event when compared with its extension *over* the British Isles in the early periods of our history. Indeed, the former has taken place almost entirely since the reign of Queen Elizabeth. It was then that the first English colony, that of Virginia, was planted in North America; and it was only natural that the emigrants who left England should take their language with them. Upon the shores of America it came in contact and collision with the numerous dialects of the native Indians, and upon these it encroached just as, a thousand years before, it had encroached upon the original British of Britain. Numerous languages then became entirely lost, and, at the same time, the tribes who spoke them. Sometimes they were wholly exterminated; sometimes they were driven far into the interior of the land. In a short time populous cities stood upon the hunting-grounds of the expelled natives, and the language of the mother-country became naturalized in a New World. The subsequent settlements in Maryland, the Carolinas, and the remaining States of America completed the preponderance of the English language from the boundaries of Canada to the Gulf of Mexico.

During the Protectorate of Cromwell, the island of Jamaica was taken from the Spaniards, and from that time forwards the Eng-

* The Manks orthography is English.

lish has been the language of the greater part of the West Indian Islands.

In Canada, it first took root after the taking of Quebec, in the reign of George the Second. As Canada, however, had been previously a French colony, the European language that was first spoken there was not the English but the French. Hence, when Quebec was taken, the language of the country fell into two divisions. There were the different dialects of the original Indians, and there was the French of the first European colonists. At the present moment, both these languages maintain their ground ; so that the English is spoken only partially in Canada, the French and the Indian existing by the side of it.

At the Cape of Good Hope the English is spoken in a similar manner ; that is, it is spoken partially. The original inhabitants were the Caffre and Hottentot tribes of Africa, and the earliest European colonists were the Dutch. For these reasons Dutch and English, conjointly with the Hottentot and Caffre dialects, form the languages of the Cape of Good Hope. In Guiana, too, in South America, English and Dutch are spoken in the neighbourhood of each other, for the same reason as at the Cape.

In Asia the English language is spoken in India ; but, there, the original languages of the country are spoken to a far greater extent than is the case in either America or Africa.

Australia and New Zealand are exclusively English colonies, and, consequently, in Australia and New Zealand, English is the only *European* language that is spoken. In each of these settlements it encroaches upon the native dialects.

Malta, Gibraltar, Heligoland, Guernsey and Jersey, and many other localities of less note, are isolated spots, into which, being portions of the British dominions, the English language has been partially introduced.

§ 7. As late as the reign of Queen Elizabeth, and even later, the English language was not spoken universally and exclusively even in England. A second language was spoken in Cornwall, called the Cornish.

In the parish of Landewednack, the church service was read in that language, so late as the year 1690. A few specimens of it are still preserved in writing ; and a few of its words are incorporated in the provincial dialect as it is now spoken.

Parts of the human body.

English.	*Cornish.*	*English.*	*Cornish.*	*English.*	*Cornish.*
Head	Pen.	*Teeth*	Dyns.	*Arm*	Brech.
Hair	Bleu.	*Tongue*	Tavat.	*Hand*	Lof.
Eye	Lagat.	*Ear*	Scovorn.	*Leg*	Coes.
Nose	Tron.	*Back*	Chein.	*Foot*	Truit.
Mouth	Genan.	*Blood*	Guit.	*Nail*	Ivin.

Names of animals.

English.	*Cornish.*	*English.*	*Cornish.*	*English.*	*Cornish.*
Horse	March.	*Lamb*	Oin.	*Goose*	Guit.
Cow	Bugh.	*Goat*	Gavar.	*Crow*	Bran.
Calf	Loch.	*Dog*	Ky.	*Bird*	Ezn.

Two	Deu.	*Six*	Whe.	*Ten*	Dek.
Three	Try.	*Seven*	Seyth.	*Twenty*	Ugenis.
Four	Peswar.	*Eight*	Eath.	*Hundred*	Cant.

§ 8. In the first, second, and third centuries the English language was either not spoken in Great Britain at all, or spoken very partially.

A little consideration will show that the extension of the English language over the different English counties, and over the British Isles in general, was carried on in the same way as the extension of the English language over countries like America, Australia, and New Zealand. In America, Australia, and New Zealand, there were the original native languages, originally spoken by the original inhabitants. There was just the same in England.

In America, Australia, and New Zealand, the native languages still continue to be spoken, side by side with the English, although only partially. It is just the same in Wales, Scotland, Ireland, and the Isle of Man. In all these portions of the British Isles, the native languages still continue. They are encroached upon by the English; still, however, they continue. By observing this, we understand the important fact that, even in *England*, the *English* language is no native tongue, but an imported one; whereas the really native languages of Great Britain were languages allied to the present Welsh, Gaelic, and Manks. These, however, as the English dialects gradually extended themselves, gradually retreated.

Nor is this all. It is easy to see from the foregoing specimens that the languages which they represent belong to the same class. The Scotch and Irish Gaelic, indeed, are simply dialects of the same language. The Manks is closely akin to them; though the difference of spelling disguises the likeness. The same is the case with the Welsh and Cornish. Between, however, the Welsh and Cornish on one side, and the Gaelic and Manks on the other, the affinity is less evident. Still it exists.

Now the general name for the group to which these languages are referred is *Celtic*, *Keltic*, *Celt*, or *Kelt*, a name which applies to other languages besides those of the British Islands. It is well known that the same language was spoken by the old inhabi-

tants of France, as well as by the old inhabitants of England; in other words, the language of *Gallia* was also that of *Britannia*. At the present time, there is one important district in France where the peasants retain the original tongue—the province of Brittany. This is very closely allied to the Cornish, and almost as closely to the Welsh.

Parts of the human body.

English.	*Breton.*	*English.*	*Breton.*	*English.*	*Breton.*

The precise meaning of the word Anglo-Saxon is by no means a matter of certainty: inasmuch as the word *Saxon* may have either of the two following senses. It may be the name of a people, distinct and separate from the Angles; or it may be a second name for the Angles. In other words, the two designations may be synonymous. Neither is this distinction unimportant. Many good inquirers have gone upon the former of these alternatives, and, believing that the two names indicated two populations, have investigated the nature of the difference; asking, from what part of Germany the two nations respectively came; asking, how they differed; asking, how far that difference extended. And the question does not end here. If one part of England was Saxon and another Angle, it may be well to see whether traces of the original variation still exist; whether certain local customs may not be Saxon rather than Angle, certain points of dialect Saxon rather than Angle, and *vice versâ.* It is clear, on the other hand, that if no such original differences existed, no such considerations are necessary.

Let us look at our maps.—Three English counties, at the present moment, take their name from the word *Seaxe* (*Saxons*), and preserve the denomination of the three *Saxon* kingdoms—*viz.* Es-*sex*, Sus-*sex*, and Middle-*sex*. There is no doubt as to the analysis and import of these compounds. *Essex* is a slightly-

modified form of East Seaxe, Middlesex of Middle Seaxe, and Sussex of Suð Seaxe; and, when we find them in the pages of a Latin writer, their equivalents are *Orientales Saxones*, *Australes Saxones*, and *Mediterranei Saxones*. These three names we find at the present time. But, besides these, there is a fourth compound which is now obsolete. The counties of Hants, Wilts, Berks, Gloster, Dorset, with parts of the counties adjacent, originally constituted the kingdom of the *West Saxons*, or *Wessex; Occidui Saxones*, as they are called by the Latin writers. Hence, whatever may have been the character of the other parts of England, four districts carried their Saxon character in their name, and three do so at the present moment.

This, however, by no means proves that the Saxons and Angles were different. In the first place, it may be said with safety that, whatever may have been the original distinctions between the Angles and Saxons, they cannot be discovered by the closest enquiry at the present time. It is true that the provincial dialects of such counties as Northumberland, Durham, or Yorkshire, are capable of being strongly contrasted with those of Sussex or Hampshire; and it is true that there are differences in manners and customs between the North-county and the South-county Englishmen. But it is far from being certain that anything of this kind is due to the fact of one population having been Angle, the other Saxon. There may merely have been a difference of South and North.

Between the Angle and the Saxon counties which lie next to each other no such distinctions exist: *e. g.* Suffolk was a part of the kingdom of the East Angles; yet Angle Suffolk and Saxon Essex are as like as any two counties in England.

Again—the terms are used synonymously and indifferently by the early writers; who, when they mention the language of the English part of the island, say *lingua Anglorum—lingua Saxonum—lingua Anglorum sive Saxonum.*

Upon the whole, however, the term *Anglè* predominates; to which fact it must be added, that the king who first enacted that the whole island should take the name of England (*Angle*-land) was Ecbert, king of Wessex, or the West *Saxons*, and not king of any of the specially Angle parts of the island.

At the present time the Welsh know nothing of the *Angles*. *Their* name for an Englishman is *Saxon*.

At the present time, too, an Englishman calls himself an *Englishman*—not a *Saxon*.

In the opinion of the writer this gives us the clue to the meaning of the word Anglo-Saxon: for he considers that the difference between the *Angle* and *Saxon* was chiefly a difference of *name*. An *Angle* was a *Saxon* in the eyes of a Briton, and, as the Romans adopted the British names, the Angles of the most Roman portions of Britain were called Saxons.

Until the Norman Conquest the Anglo-Saxon was the language of both the learned and unlearned, and it was a written language as well as a spoken one. Not only was it written, but it was one of the earliest cultivated languages of modern Europe; so much so, that before there was a single line written either in French or Italian, in Spanish or Portuguese, there was a considerable Anglo-Saxon literature. Whilst a corrupted form of the Latin was the medium of communication through the southern half of Western Europe, the language of England was the language of legislators, annalists, and poets.

A poem, attributed to a monk of Whitby in Yorkshire, named Cædmon, is one of the most remarkable of the Anglo-Saxon poems. Much of its sublimity is taken from the Old Testament, of which it is a metrical paraphrase. The poem of Cædmon is an important specimen of the sacred poetry of the Anglo-Saxons. Next to it in point of importance are the following poems:—

Judith—A fragment on the actions of Judith, the slayer of Holophernes.

Andreas—The metrical life and acts of St. Andrew.

Helena—The discovery of the True Cross by Helena, mother of Constantine the Great.

Of the prose-writers, known to us by name, the two most conspicuous are Alfred the Great and Ælfric. The influence of the former upon the laws and learning of England is a matter of general history; whilst the most important collection of Anglo-Saxon homilies is the work of the latter.

The Anglo-Saxon is the mother-tongue of the present English; nevertheless, if we compare the present English of the nineteenth century with the Anglo-Saxon of the ninth, the following points of difference will be observed:

1. The Anglo-Saxon language contained words that are either wanting in the present English, or, if found, used in a different sense.

A. S.	English.	A. S.	English.
lyft	*air*	swithe	*very*
lichoma	*body*	sáre	*very*
stefn	*voice*	sith	*late*
theód	*people*	reccan	*care about*
ece	*everlasting*	ongitan	*understand*
hwæt	*sharp*	sweltan	*die*, &c.

These words, which are very numerous, although lost (or changed as to meaning) in the current English, are often preserved in the provincial dialects.

2. The present English contains words that were either wanting in the Anglo-Saxon, or, if found, used in a different sense—*voice*,

people, *conjugal*, *philosophy*, *alchemist*, *very*, *survey*, *shawl*, and other words, to the amount of some hundreds. These have been introduced since the time of the Anglo-Saxons, from the Latin, Greek, French, Arabic, and other languages.

3. Words found in both Anglo-Saxon and English appear in different forms in the different languages.

A. S.	English.	A. S.	English.
án	*one*	gærs	*grass*
eahta	*eight*	ic	*I*
nygon	*nine*	spræc	*speech*
endlufon	*eleven*	eáge	*eye*, &c.

4. The Anglo-Saxon contained grammatical forms that are wanting in the present English.

A. S.	English.	A. S.	English.
tung-*ena*	*tongues*	god-*ra*	*good*
word-*a*	*words*	wi-*t*	*we two*
treow-*u*	*tree-s*	gi-*t*	*ye two*
god-*an*	*good*	hwo-*ne*	*who-m*
god-*re*	*good*	we luf-*iath*	*we love*
god-*ne*	*good*	we luf-*odon*	*we loved*
god-*es*	*good*	to luf-*ianne*	*to love*, &c.

5. The present English contains grammatical forms that were wanting in Anglo-Saxon. The words *ours*, *yours*, *theirs*, *hers*, were unknown in Anglo-Saxon.

6. Grammatical forms found both in the Anglo-Saxon and the English, appear differently in the different languages.

A. S.	English.	A. S.	English.
smith-*es*	*smith's*	hvá-*m*	*who-m*
smith-*as*	*smith-s*	blets-*ode*	*bless-ed*, &c.

7. Phrases and sentences were used in Anglo-Saxon which are inadmissible in the present English.

8. Phrases and sentences are used in the modern English which were inadmissible in Anglo-Saxon.

§ 14. A fresh language was introduced into England by the Norman Conquest. This may be called either *Anglo-Norman*, or *Norman-French*.

It resembled the modern French.

Parts of the human body.

SPECIMEN,

From the Anglo-Norman Poem of Charlemagne.

Un jur fu Karleún al Seint-Denis muster,
Reout pris sa corune, en croiz seignat sun chef,
E ad ceinte sa espée, li pons fud d'or mer.
Dux i out e demeines e baruns e chevalers.
Li emperéres reguardet la reine sa muillers ;
Ele fut ben corunée al plus bel e as meuz.

The change effected upon the English language by the Norman Conquest was not less than the change effected by the same event upon the property of the country, its habits, its liberties, and its constitution ; and the results of the battle of Hastings upon the literature of England were proportionate to the alteration of our language. The language of the Conqueror was the language of his attendants also : and hence, the nobles who composed his court spoke Anglo-Norman amongst their equals, Anglo-Saxon to their servants. The language of the nobles was the language of the lawyers, and the language of the lawyers was the language of the church : so that the court, the courts of law, and the cloisters, were equally Normanized. Then, as a great portion of the original landholders were dispossessed, and their estates transferred to Norman barons, and as the new lords of the soil resided on their estates, and surrounded themselves with numerous retainers, the language that was spoken in the great castles became the language, more or less, of the country around.

Without knowing the exact extent to which the Anglo-Norman displaced the Anglo-Saxon, we may believe the following particulars :—

a. Letters even of a private nature were written in Latin till the beginning of the reign of Edward I., when a sudden change brought in the use of French.

b. Conversation between the Members of the Universities was ordered to be carried on in either Latin or French.

c. The Minutes of the Corporation of London were in French, as well as the proceedings in Parliament and the Courts of Justice.

A tract, however, of the beginning of the fourteenth century gives reasonable grounds for believing, that before the accession of Edward II., the Norman-French had ceased to be the *exclusive* language of even the aristocracy. At the request of the noble Lady Dionysia de Mounchensy, Walter de Biblesworth composed a poem in French verse, with interlineations in English, in order to teach the rising generation French—*ke les enfauns pussunt saver les propretez des choses ke veyunt, et kaunt dewunt dire* moun *et* ma, soun *et* sa, le *et* la, moy *et* ji.

On the other hand, the Anglo-Norman of England was not *exactly* the same as the French of France. In the reign of Edward III., Chaucer, describing the manners of an English nun, says that "she spoke French cleverly, but as it was spoken in the school of Stratford-le-Bow, rather than as it was spoken at Paris."

> And Frenche she spake full feteously,
> After the scole of Stratford atte Bowe,
> For French of Parys was to her unknowe.
> *Prologue to the Canterbury Tales.*

§ 15. From the Battle of Hastings to the death of John, the language of England is called, not *Anglo*-Saxon, but *Semi*-Saxon.

SPECIMEN.

In two Dialects,

Bladud hafde ene sune,	Bladud hadde one sone,
Leir was ihaten ;	Leir was ihote ;
Efter his fader daie ;	After his fader he held þis lond,
He heold þis drihlice lond,	In his owene hond.
Somed an his live,	Ilaste his lif-dages,
Sixti winter.	Sixti winter.
He makade ane riche burh,	He makade on riche borh,

þurh radfulle his crafte,	þorh wisemenne reade,
And he heo lette nemnen,	And hine lette nemni,
Efter him seolvan ;	After him seolve ;
Kaer-Leir hehte þe burh.	Kair-Leir hehte þe borh.
Leof heo wes þan kinge,	Leof he was þan kinge;
þa we, an ure leod-quide,	þe we, on ure speche,
Leir-chestre clepiad,	Leþ-chestre cleopieþ,
Geare a þan holde dawon.	In þan eolde daiye.

§ 16. From the death of John to the death of Edward the Second, the language of England is called *Early* English.

§ 17. From the death of Edward the Second to the death of Queen Mary, the language of England is called *Middle* English.

§ 18. The period of the *Modern* English begins with the reign of Queen Elizabeth, and the Modern English is the English of the present time.

Such is the exhibition of the *stages* of the English language; through which it has passed between the period of the Anglo-Saxons and the present day. The divisions thus established are of practical convenience in the consideration of the history of our language. Nevertheless, it must not be supposed that the transition from one stage to another is by any means so sudden and definite as it shows itself in the preceding dates. It cannot be believed that, *exactly* at the death of King John, the language changed from Semi-Saxon to Old English, or *exactly* at the accession of Edward the Third, from Old English to Middle. The change was *gradual*. The reigns, however, of the kings are taken for the sake of putting the epochs in question in the form best fitted for being remembered. For the sake, too, of explaining the real nature of the changes of the English Language, the following sketch of its history is annexed :—

The first four reigns after the Conquest were unfavourable to the cultivation of literature *at all:* since the Norman-French, although sufficient to depress the Anglo-Saxon, was not sufficient to establish a flourishing literature of its own. *Some* works were composed in *both* languages. They were, however, in each case both few and unimportant.

The reign of *Henry the Second* was a favourable period for *one* of the languages of England, viz. for the Norman-French.

A proclamation of *Henry the Third's* to the people of Huntingdonshire is generally considered to be one of the first specimens of

English, properly so called, *i. e.* of English, as opposed to Semi-Saxon. The date is A.D. 1258. Still the preponderating language for *written compositions* is the Anglo-Norman.

A reaction, however, begins. The father of English poetry, Chaucer, wrote under *Edward III.*; so did his cotemporary Wycliffe, and others of almost equal importance; their predecessors, who had written in English at all, having written either in the Old English, or the Semi-Saxon.

In the reign of *Edward IV.*, printing was introduced into England by Caxton. By this time, the Anglo-Norman language had become almost wholly superseded by the English, remaining only as the language of a few of the Courts of Law. The English, however, as may be expected, has changed from the English of Chaucer, and is approaching the character of the English of the writers under Henry VIII. In south Britain no poetical successor worthy of comparison with Chaucer has appeared. In Scotland, however, there is the dawning of a bright period.

The establishment of the Protestant religion, and the revival of Classical Learning, are the two great influences in the reign of *Henry VIII.*; the effects of both upon the style of our writers and the language itself being beneficial. The works of Sir Thomas More, and the earliest translations of the Bible, are the chief instances of the now rapidly-increasing English literature.

During the long reign of *Queen Elizabeth* the language underwent considerable change, and the early Elizabethan writers are much less like the writers of the present century than the later ones. Indeed, what is called the age of Queen Elizabeth comprises the reign of James the First, and part of that of Charles. This is the age of Shakspeare and his cotemporary dramatists. It is also the time when the present translation of the Bible was made. The extent to which the English of the time in question is marked by peculiar indications of antiquity is generally known; so that the present general sketch of the history of the English language ends with the death of James the First.

Particular relations of the English language with certain languages of the Continent of Europe.

MAP-WORK.

(*Map of British Isles and Northern Germany.*)

Make a list of words ending (or beginning with) *stow*, *sted* (*stead*), *ton*, *thorpe* (*dorf*), *hurst* (*horst*), *mere*, *ham* (*heim*, *hem*), *wick*.

Observe in what parts they are found most abundantly.

§ 19. The Early language, most closely allied to

the *Anglo*-Saxon, is known by the name of the *Old*-Saxon.

At the head of the specimens of the Old-Saxon stand what may be called the *Essen Roll*, or the *Essen Muniments* (quoted as *Rotulus Essensis*), and the *Essen Creed* (i. e. *Confessionis Formula Essensis*); the locality of which, as indicated by their titles, is the district about the Westphalian town of Essen.

1.

R. Ec gelobo in Halogan Gast.

The *Heliand* is believed, and that on good grounds, to represent the language of the parts about Münster. It is the most important of its class. *Heliand* means *Healer*, or Saviour; the work so entitled being a Gospel History in metre. Now, although it was in some part of Westphalia that the Heliand took its form, it was in an English library that the MS. of it was first discovered. Hence it passed for a form of the Anglo-Saxon. But this form was so peculiar as to require an hypothesis to account for it; and the doctrine that a certain amount of Danish influence was the cause so far prevailed as to establish the term *Dano*-Saxon. In the eyes, then, of Hickes, Lye, and the older Anglo-Saxon scholars, the Heliand was a Dano-Saxon composition, and so it continued until the present century, when not only was its Danish character denied, but its Westphalian origin was indicated.

Heliand, Nativitas Christi pastoribus annunciata.

Luc. II. 8– 13.

Tho uuard managun cud,	Then it was to many known,
Obar thesa uuidon uuerold.	Over this wide world.
Uuardos antfundun,	The words they discovered,
Thea thar, ehuscalcos,	They [that] there, as horse-grooms,
Uta uuarun,	Without were,
Ueros an uuahtu,	Men at watch,

Wuiggeo gomean,
Uehas aftar felda.
Gisahun finistri an tuue
Telatan an lufte ;
Endi quam lioht Godes,
Uuanum thurh thui uuolcan ;
Endi thea uuardos thar
Bifeng an them felda.
Sie uurdun an forhtun tho,
Thea man an ira moda.
Gisahun thar mahtigna
Godes Engil cuman ;
The im tegegnes sprac.
Het that im thea uuardos—
" Uuiht ne antdredin
Ledes fon them liohta.
Ic scal eu quadhe liobora thing,
Suido uuarlico
Uuilleon seggean,
Cudean craft mikil.
Nu is Krist geboran,
An thesero selbun naht,
Salig barn Godes,
An thera Davides burg,
Drohtin the godo:
That is mendislo
Manno cunneas,
Allaro firiho fruma.
Thar gi ina fidan mugun,
An Bethlema burg,
Barno rikiost.
Hebbiath that te tecna,
That ic eu gitellean mag,
Uuarun uuordun,
That he thar biuundan ligid,
That kind an enera cribbium,
Tho he si cuning obar al
Erdun endi himiles,
Endi obar eldeo barn,
Uueroldes uualdand."
Reht so he tho that uuord gesprace
So uuard thar engilo te them
Unrim cuman,
Helag heriskepi,
Fon hebanuuanga,
Fagar folc Godes,

Horses to tend,
Cattle on the field.
They saw the darkness in two
Dissipated in the atmosphere,
And came a light of God
—through the welkin;
And the words there
Caught on the field.
They were in fright then
The men in their mood.
They saw there mighty
God's angel come ;
That to them face-to-face spake.
It bade thus them these words—
" Dread not a whit
Of mischief from the light.
I shall to you speak glad things,
Very true ;
Say commands ;
Show strength great.
Now is Christ born,
In this self-same night ;
The blessed child of God,
In the David's city,
The Lord the good :
That is exultation
To the races of men,
Of all men the advancement.
There ye may find him
In the city of Bethlehem,
The noblest of children.
Ye have as a token
That I tell ye
True words,
That he there swathed lieth,
The child in a crib,
Though he be king over all
Earth and Heaven,
And over the sons of men,
Of the world the Ruler."
Right as he that word spake,

So was there of Angels to them,
In a multitude, come
A holy host,
From the Heaven-plains,
The fair folk of God,

Endi filu sprakun,	And much they spake
Lofuuord manag,	Praise-words many,
Liudeo herron.	To the Lord of Hosts.
Afhobun tho helagna sang,	They raised the holy song,
Tho sie eft te hebanuuanga	As they back to the Heaven-plains
Uundun thurh thiu uuolcan.	Wound through the welkin.
Thea uuardus hordun,	The words they heard,
Huo thiu engilo craft	How the strength of the Angels
Alomahtigna God,	The Almighty God,
Suido uuerdlico,	Very worthily,
Uuordun louodun.	With words praised.
"Diurida si nu," quadun sie,	"Love be there now," quoth they,
"Drohtine selbun,	"To the Lord himself
An them hohoston	On the highest
Himilo rikea;	Kingdom of Heaven,
Endi fridu an erdu,	And peace on earth
Firiho barnum,	To the children of men,
Goduuilligun gumun,	Goodwilled men
Them the God antkennead,	Who know God,
Thurh hluttran hugi."	Through a pure mind."

The following, from a translation of the Psalms, is held by some to be the Old Dutch of Holland rather than Old-Saxon:—

PSALM liv.

2. Gehori Got gebet min; in ne furuuir(p) bida mina; thenke ti mi; in gehori mi.

3. Gidruouit bin an tilogon minro, in mistrot bin fan stimmon fiundes, in fan arbeide sundiges.

4. Uuanda geneigedon an mi unreht, in an abulge unsuoti uuaron mi.

5. Herta min gidruouit ist an mi, in forta duodis fiel ouir mi.

6. Forthta in biuonga quamon ouer mi, in bethecoda mi thuisternussi.

7. In ic quad "uuie sal geuan mi fetheron also duuon, in ic fliugon sal, in raston sal."

§ 20. After the *Old*-Saxon, the Early language next in nearness to the Anglo-Saxon is the Early Frisian. This is the language of the Dutch province of Friesland in its oldest form.

Asega-bog, i. 3. pp. 13, 14. (*Ed. Wiarda.*)

§ 21. Of the existing forms of speech, the language most allied to the English is the *Modern* Frisian, still spoken in the Dutch Province of Friesland, in a few localities in Oldenburg and Hanover, in Heligoland, and on the western coast of the Duchy of Sleswick.

MAP-WORK.

Make a list of words ending in *-um*, and observe in what parts they occur most abundantly.

§ 22. After the Frisian, in the order of nearness to the English, comes the Dutch of Holland.

SPECIMEN.

MARK, Chap. i.

1. Het begin des Evangelies van Jezus Christus, den Zoon van God.
2. Gelijk geschreven is in de Profeten: Zeit, Ik zend mijnen Engel voor uw aangezigt, die uwen weg voor u heen bereiden zal.
3. De stem des roependen in de woestijn: Bereidt den weg des Heeren, maakt zijne paden regt!
4. Johannes was doopende in de woestijn, en predikende den doop der bekeering tot vergeving der zonden.
5. En al het Joodsche land ging tot hem uit, en die van Jerûzalem; en werden allen van hem gedoopt in the rivier de Jordaan, belijdende hunne zonden.
6. En Johannes was gekleed met kemelshaar, en met eenen lederen gordel om zijne lendenen, en at sprinkhannen en wilden honig.
7. En hij predikte, zeggende: na mij komt, die sterker is dan ik, wiên ik niet waardig ben, nederbukkende, den riem zijner schoenen te ontbinden.
8. Ik heb ulieden wel gedoopt met water, maar hij zal u doopen met den Heiligen Geest.

§ 23. After the Dutch of Holland, in order of nearness to the English, come the *provincial dialects* of Westphalia, Oldenburg, Holstein, Sleswick, Mecklenburg, Pomerania, and other parts of Northern and Western Germany; and after these the *provincial dialects* of Southern and Central Germany, and the cultivated language of literary Germany.

1.

FROM LESSING'S FABLES.

HERKULES.

Als Herkules in den Himmel aufgenommen ward, machte er seinen Gruss unter allen Göttern der Juno zuerst. Der ganze Himmel und Juno erstaunte darüber. "Deiner Feindin," rief man ihm zu, "begegnest du so vorzüglich?" "Ja, ihr selbst;" erwiederte Herkules. "Nur ihre Verfolgungen sind es, die mir

zu den Thaten Gelegenheit gegeben, womit ich den Himmel verdienet habe."

Der Olymp billigte die Antwort des neuen Gottes, und Juno ward versöhnt.

2.

From Herder.

Horch, horch die Lerch' am Himmelsthür singt,
Die liebe Sonn' wacht auf;
Aus allen Blümenkelchen trinkt
Sie schon ihr Öpfer auf.
Das Hochzeitknöspfchen freundlich winkt,
Und thut sein Äüglein auf;
Was hold und lieb ist, freundlich blinkt,
Wach schönes Kind wach auf,
Wach auf;
Wach schönes Kind wach auf.

§ 24. The Goths who sacked Rome under Alaric, and who succeeded to the empire of Augustulus under Theodoric, were of German origin, and the language that they spoke was German also. It is called the Mœso-Gothic.

Of this language we have a specimen, not later than the fourth century; and as no Anglo-Saxon work is of equal antiquity, the language in question is considered to be the oldest of all the Ger-

man tongues. The meaning of the word Mœso-Gothic will be understood if, by following the course of the Danube, we reach the Roman province of Mœsia. The *earliest* inhabitants of this province were not akin to any of the tribes of Germany, any more than the original Britons of England were akin to the Anglo-Saxon invaders. In the second century, however, they were conquered by tribes from (probably) the south-eastern parts of Germany. These were called Goths, or, more specifically, the Goths of Mœsia.

1.

Kong Christian stod ved höien Mast,
I Rög og Damp;
Hans Værge hamrede saa fast,
At Gothens Hjelm og Hjerne brast;
Da sank hvert fiendtligt Speil og Mast
I Rög og Damp.
Flye, skreg de, flye, hvad flygte kan!
Hvo staaer for Danmarks Christian
I Kamp?

Niels Juel gav Agt paa Stormens Brag,
Nu er det Tid!
Han heisede det röde Flag,
Og slog paa Fienden Slag i Slag;
Da skreg de höit blandt Stormens Brag:
Nu er det Tid!
Flye, skreg de, hver, som veed et Skjul!
Hvo kan bestaae for Danmarks Juel
J Strid?

O Nordhav! Glimt af Vessel bröd
Din mörke Skye.
Da tyede Kæmper til dit Skjöd;
Thi med ham lyned' Skræk og Död.
Fra Vallen hörtes Vraal, som bröd
Din tykke Skye.
Fra Danmark lyner Tordenskjold;
Hver give sig i Himlens Vold,
Og flye!

Du Danskes Vei til Roes og Magt,
Sortladne Hav!
Modtag din Ven, som uforsagt
Tör möde Faren med Foragt,
Saa stolt, som du, mod Stormens Magt,
Sortladne Hav!
Og rask igjennem Larm og Spil
Og Kamp og Seier för mig til
Min Grav!

2.

Frihedens Tempel i Normandens Dale
Stander saa herligt i Ly af hans Fjeld;
Frit tör han tænke, og frit tör han tale,
Frit tör han virke til Norriges Held.
Fuglen i Skove,
Nordhavets Vove
Friere er ei end Norriges Mand;
Villig dog lyder han selvgivne Love,
Trofast mod Konning og Fædreneland.

Elskede Land med de skyhöie Bjerge,
Frugtbare Dale og fiskrige Kyst!
Troskab og Kjærlighed fro vi Dig sværge!
Kalder Du, blöde vi for Dig med Lyst.
Evig Du stande,
Elskte blandt Lande!
Frit som den storm, der omsuser Dit Fjeld;
Og medens Bölgen omsnoer Dine Strande,
Stedse Du voxe i Hæder og Held!

§ 26. The Swedish of Sweden is allied to the German dialects in general, and consequently to the English.

SPECIMEN.

Kung Ring han satt i högbänk om julen och drack mjöd,
Hos honom satt hans drottning så hvit och rosenröd.
Som vår och höst dem båda man såg bredvid hvarann,
Hon var den friska våren, den kulna höst var han.

Då trädde uti salen en okänd gubbe in,
Från hufvud och till fötter han insvept var i skinn.
Han hade staf i handen och lutad sågs han gå,
Men högre än de andra den gamle var ändå.

Han satte sig på bänken längst ned vid salens dörr;
Der är de armas ställe ännu, som det var förr.
De hofmän logo smädligt och sågo till hvarann,
Och pekade med fingret på luden björnskinnsmann.

Då ljungar med två ögon den främmande så hvasst,
Med ena handen grep han en ungersven i hast,
Helt varligen han vände den hofman upp och ned,
Då tystnade de andre; vi hade gjort så med.

§ 27. The Icelandic of Iceland is allied to the German dialects in general, and consequently to the English.

þeim er or helju kom.

Sá var blóðugr
um brjóst framan,
ok galdrs föður
gól um lengi.
Framm reið Oðinn.
foldvegr dundi,
hann kom at háfu
Heljar ranni.

§ 28. The language of the Feroe Isles is allied to the German dialects in general, and consequently to the English.

§ 29. The Icelandic, in its oldest form, is called Old Norse.

§ 30. The Icelandic, Feroic, Danish, and Swedish, are all derived from the Old Norse, and consequently all allied to each other.

§ 31. The Old Norse, the Icelandic, the Feroic, the Swedish, and the Danish, are much more closely allied to each other than they are to any German dialect. Hence they form a separate group, which is sometimes called the *Norse*, and sometimes the *Scandinavian* branch of languages.

The English language stands to the Anglo-Saxon in the relation of a derived language to a mother tongue, or (changing the expression) the English may be called the Anglo-Saxon in its *most modern* form; whilst the Anglo-Saxon may, with equal propriety, be called the English in its *most ancient* form. However, it is not so important to settle the particular mode of expressing the nature of this relation, as to become familiar with certain facts connected

with recent languages as compared with the older ones from which they originate ; facts which chiefly arise out of the tenses of the verbs, and the cases of the nouns.

§ 32. The Middle English has inflections which are wanting in the Modern ; and the Early English has inflections which are wanting in the Middle. The Semi-Saxon has inflections that are wanting in the Early English ; and the Anglo-Saxon has inflections which are wanting in the Semi-Saxon.

§ 33. The Middle Frisian has inflections which are wanting in the Modern ; and the Early Frisian has inflections which are wanting in the Middle.

§ 34. The earlier the stage of the Dutch language, the more numerous the inflections.

§ 35. The earlier the stage of the High German, the more numerous the inflections.

§ 36. The inflections of the Mœso-Gothic are more numerous than those of any of the allied languages.

§ 37. The earlier the stage of the Danish, the more numerous the inflections.

§ 38. The earlier the stage of the Swedish, the more numerous the inflections.

So much for the comparison between the different stages of one and the same language. It shows that the earlier the stage, the fuller the inflection ; the later the stage, the scantier the inflection ; in other words, it shows that as languages become modern they lose their inflections.

Now there is another view of this fact ; a view which we get when we compare allied languages that change with different degrees of rapidity. *E. g.*—

§ 39. The Danish language has changed more rapidly than the Swedish, and consequently has, at the present moment, fewer of its original inflections.

§ 40. The Swedish language has changed more rapidly than the Feroic, and consequently has, at the present moment, fewer of its original inflections.

§ 41. The Feroic has changed more rapidly than the Icelandic, and consequently has, at the present moment, fewer of its original inflections.

§ 42. The Icelandic has changed so slowly, that it retains almost all the original inflections of the Old Norse.

§ 43. In all the languages allied to the English, the earlier the stage, the more numerous are the inflections, and *vice versâ*.

MAP-WORK.

(*England.*)

Make a list of the names of places:—

a. Beginning with *Carl*, *Skel*, *Skip*;
b. Beginning or ending with *kirk*;
c. Ending with *-by*;
d. Ending with *-chester* (or *-cester*), and *-caster*.

Observe in what parts they are found most abundantly.

PART II.—GRAMMAR.

§ 44. *Orthoëpy* signifies the right *utterance* of words. It deals with language as it is *spoken*, and determines how a word is to be *pronounced*. *Orthography* signifies the right use of *letters*. It deals with language as it is *written*, and determines how words should be *spelt*.

All languages were spoken long before they were written; and, at the present moment, there are numerous forms of speech which have never been reduced to writing at all. Hence, letters come later than the sounds they express, and orthography is subordinate to orthoëpy.

But as a picture never exactly and perfectly represents the object from which it is taken, so the orthography of a language never exactly and perfectly represents the orthoëpy; in other words, there is always some difference between language as it is spoken and language as it is written. Sometimes there are more sounds than letters. Sometimes words change their pronunciation as they pass from one people or from one generation to another; whilst no corresponding change is made in the manner of writing them. Sometimes fresh sounds from other languages are introduced; and, as no fresh letters are brought to represent them, they must be represented, as they best may, by the letters already in use.

§ 45. There are forty elementary *sounds* in English, thirty-four of which are simple, and six compound.

§.	*Vowels.*	1.	The sound of	the	letter	*a*	in *father.*
,,		2.	,,	,,	,,	*a*	,, *fate.*
,,		3.	,,	,,	,,	*a*	,, *fat.*

,,	16.	,, ,, ,,	*b*	,,	*bane.*
,,	17.	,, ,, ,,	*f*	,,	*fane.*
,,	18.	,, ,, ,,	*v*	,,	*vane.*
,,	19.	,, ,, ,,	*t*	,,	*tin.*
,,	20.	,, ,, ,,	*d*	,,	*din.*
,,	21.	,, ,, letters	*th*	,,	*thin.*
,,	22.	,, ,, ,,	*th*	,,	*thine.*
,,	23.	,, ,, letter	*k*	,,	*kill.*
,,	24.	,, ,, ,,	*g*	,,	*gun.*
,,	25.	,, ,, ,,	*s*	,,	*seal.*
,,	26.	,, ,, ,,	*z*	,,	*zeal.*
,,	27.	,, ,, letters	*sh*	,,	*shine.*
,,	28.	,, ,, letter	*z*	,,	*azure.*
Nasal.	29.	,, ,, letters	*ng*	,,	*king.*
Breathing.	30.	,, ,, letter	*h*	,,	*hot.*
Liquids.	31.	,, ,, ,,	*l*	,,	*low.*
,,	32.	,, ,, ,,	*m*	,,	*mow.*
,,	33.	,, ,, ,,	*n*	,,	*no.*
,,	34.	,, ,, ,,	*r*	,,	*row.*
Diphthongs.	35.	,, ,, letters	*ou*	,,	*house.*
,,	36.	,, ,, ,,	*ew*	,,	*new.*
,,	37.	,, ,, letter	*i*	,,	*pine.*
,,	38.	,, ,, letters	*oi*	,,	*voice.*

To these add, 39 and 40, the sounds of the letters *ch*, and *j*; as they are heard in words like *chest*, *child*, *cherry*, *jest*, *John*, &c.

The real sound in the first of these instances is that of *tsh*, or nearly so. Thus :—

Church might be spelt *tshurtsh*
Chide ,, *tshide*
Chirp ,, *tshirp*, &c.

In a few words this *-t* shows itself in the spelling. *Witch* = *female wizard* gives it; whereas *which*, the relative pronoun, is without it. It occurs, too, in *Dutch* as contrasted with *Duchy;* and *Pritchard* as compared with *Prichard* and *Richard.*

Again—the real sound of the *j* in *jest* is that of *dzh*, or nearly so : thus—

Join might be spelt *dzhoin*
Jump ,, *dzhump*
Jet ,, *dzhet*

In several words this *-d* shows itself in the spelling; *e.g.* in *judge* (*dzhudzh*), *grudge*, &c.

Such being the case it becomes clear that, for all the purposes of etymology, words ending in the sound of *ch*, are the same as words in *sh*, so that rules which apply to words like *lash*, apply also to words like *church*. This, if spelt phonetically, would be *tshurtsh* —or nearly so.

For these rules, however, to apply, the *ch* must have its usual power. When it represents the Greek χ, as in *monarch*, *patriarch*, *heresiarch*, &c., it is, to all intents and purposes, *k*.

Mutatis mutandis—what applies to *ch* and *sh*, applies to *j* and *zh*: though as *j* never appears at the end of words, and as *zh* is never written, the relations are not quite so clear.

The two sounds, taken together, are conveniently called *compound sibilants;* the *simple* sibilants being *s*, *sh*, *z*, and *zh* (French *j*). They are called sibilants from their hissing sound—*sibilans*, *sibilantis*, from *sibilo* = *I hiss*.

§ 46. Of the fourteen mutes, seven are surd, seven sonant.

Surds.

1. The sound of the *p* in *pain*.
2. – – *f* in *vane*.
3. – – *t* in *tin*.
4. – – *th* in *thin*.
5. – – *k* in *kill*.
6. – – *s* in *sign*.
7. – – *sh* in *shine*.

Sonants.

1. The sound of the *b* in *bane*.
2. – – *v* in *vane*.
3. – – *d* in *dine*.
4. – – *th* in *thine*.
5. – – *g* in *gun*.
6. – – *z* in *zeal*.
7. – – *z* in *azure*.

§ 47. Each surd corresponds with a sonant, and each sonant with a surd.

p is the surd sound of *b*.
f – – *v*.
t – – *d*.
th in *thin* – – *th* in *thine*.
k – – *g*.
s – – *z*.
sh in *shine* – *z* in *azure*.

and, conversely,

b is the sonant sound of *p*.
v – *f*.
d – *t*.
th in *thine* – *th* in *thin*.
g – *k*.
z – *s*.
z in *azure* – *sh* in *shine*.

Hence,

p is the surd equivalent of *b*.
b is the sonant of *p*.
f is the surd of *v*.
v is the sonant of *f*.
t is the surd of *d*.
d is the sonant of *t*.

and so on throughout.

§ 48. Two mutes, one of which is sonant, and the other surd, coming together in the same syllable, cannot be *pronounced*.

This may be understood by practising a few combinations according to the following table.

Sonant.		Surd.	
p	f	b	v
t	th	d	th
k	—	g	—,
s	sh	z	z*

Now, taking whatever letter we choose from the one side of the line, and joining it with any one whatever from the other side of the line, we find the combination unpronounceable.

abt,	*avt*,	*abth*,	*avth*.
agt,	*agp*,	*agf*,	*ags*.
apd,	*afb*,	*apv*,	*afd*.
atb,	*akd*,	*akz*,	*akb*.
asd,	*ashd*,	*asg*,	*ashg*, &c.

Of course, combinations of this sort can be *written*, and they can be *spelt*; they cannot, however, be *pronounced*.

In order to become *pronounced*, a change must occur: one of the sounds must change its character, and so accommodate itself to the other. This change takes place in one of two ways; either the first of the two sounds takes the sonancy of the second, or else

* As the *z* in *azure*.

the second takes the sonancy of the first. Thus, *abt* becomes pronounceable either by *b* becoming *p*, or by *t* passing into *d*; in other words, it changes either into *apt* or into *abd*. So on with the rest.

avt	becomes	either	*aft*,	or	*avd*.
abth	,,	,,	*apth*,	,,	*abdh*.
agt	,,	,,	*akt*,	,,	*agd*.
ags	,,	,,	*aks*,	,,	*agz*
apd	,,	,,	*apt*,	,,	*abd*.
asd	,,	,,	*ast*,	,,	*azd*.
ashd	,,	,,	*asht*,	,,	*azhd*.
asg	,,	,,	*ask*,	,,	*azg*.

This change is necessary and universal. It holds good not for the English alone, but for all languages. The only difference is that different languages change different letters; that is, one language accommodates the first letter to the second, and so turns *agt* into *akt*; whilst another accommodates the second letter to the first, changing *agt* into *agd*.

There is no fact that requires to be more familiarly known than this; since there are, at least, three formations in the English language where its influence is most important. These are the Possessive forms in *-s*, the Plurals in *-s*, the Preterites in *-d* and *-t*.

The *s* in the word *stags* is surd; the *g* in the word *stags* is sonant. Notwithstanding this, the combination *ags* exists. It exists, however, in the spelling only. In speaking, the *s* is sounded as *z*, and the word *stags* is pronounced *stagz*. Again, in words like *tossed*, *plucked*, *looked*, the *e* is omitted in pronunciation. Hence the words become *tossd*, *pluckd*, *lookd*; that is, the surd *d* comes in contact with the sonant *k* and *s*. Now, this combination exists in the spelling only; since the preterites of *pluck*, *look*, and *toss*, are in *speech*, pronounced *pluckt*, *lookt*, *tosst*.

§ 49. A surd mute immediately preceded by a sonant one, is changed into its surd equivalent.

The most important application of this rule is the change that takes place when the sound of the letter *s* is added to any word ending in the sounds of *b*, *v*, *d*, *th*,* or *g*. In all such cases, *although the spelling remains unaltered*, the *sound* is changed. Thus,

Slabs	from	*slab*	is	pronounced	*slabz*.
Slaves	,,	*slave*	,,	,,	*slāvz*.
Lads	,,	*lad*	,,	,,	*ladz*.
Stags	,,	*stag*	,,	,,	*stagz*.

* As in *thine*.

§ 50. A sonant mute immediately preceded by a surd, is changed into its surd equivalent.

The most important application of this rule is the change that takes place when the sound of the letter *d* is added to any word ending in the sound of *p*, *f*, *k*, or *s*; when

Stepped from *step* is pronounced *stept*.
Packed ,, *pack* ,, ,, *packt*, &c.

§ 51. Two consonants with the same power, coming together in the same syllable, cannot be sounded.

This rule, like the one that precedes it, though a very important one, reads like a paradox. To all appearance, nothing is much commoner than a double consonant at the end of a syllable. Are there not such words as *miss*, *till*, *add*, *still*, *will*, and numerous others, in all of which the final consonants are both identical and doubled?

Such is undoubtedly the case; so that the objection, as far as it goes, is true. But it is not true that these double letters are *sounded*. It is only true that they are *written*. We have only to try to pronounce *bat't*, *sap'p*, &c., to see this. The writing is one thing, the utterance another. As far as mere *letters* go, we may accumulate any number of them; for it is evident that it is just as easy to write *tapp* as *tap*, *tappp* as *tapp*, *tapppp* as *tappp*, &c., so going on *ad infinitum*. Spell them, however, as we will, they are all *pronounced* alike. The final syllable in the preposition *un-til* is sounded like the verb *till*. The first syllable of *mis-place* is sounded like the single word *miss*. Between being *pitied* for one's misfortunes, and *pitted* against a rival, or with the small-pox, few make any difference of pronunciation.

So much for consonants coming together in the *same* syllable. Those that come together in *different* syllables are in a different condition. They *can* be sounded, though they are, by no means, common. They are found only in a certain class of words—and that class is a small one. It contains only compounds and derivatives, and not many of these. However, when one part of such a word *ends* with the same consonant with which the other begins, we have a true concurrence of like-sounding consonants.

Thus—let a substantive (*soul*) end in *-l*. Let it take the affix *-less*. The result is *soul-less:* a compound in which both the *l's* should be pronounced. In

Clay not dead but *soulless*,
  Though no mortal man would choose thee,
An immortal *no less*
  Deigns not to refuse thee.—Byron.

it stands as a rhyme to *no less*. The rhyme, however, is an imperfect one.

Again—to an adjective ending in *-l*, add the common affix *-ly*. This gives, from

whole *wholly.*
full *fully.*

where, whatever the spelling may be, the sound, if accurately delivered, should give that of a double *l*.

Compounds like *book-case*, *seaport-town*, are of this kind.

If this is the case, *i. e.* if the *sounds* of a double consonant are so rare, why is it that the doubling of the *letters* is so common?

The doubling of the letter, when the sound itself is single, is entirely a point of spelling. We may call it an orthographical expedient. It serves to show that the vowel which precedes it is short. Write *pited*, and the chances are that a reader would sound it *pi-ted*. Write *pitted*, and the short sound of the *i* is ensured.

This expedient is an old one. It occurs, in Latin and Greek, in words like *terra* and *θαλασσα*; where it is not likely that either the *r* or the *σ* was actually doubled in sound. It occurs, with the exception of the Lithuanic (where it is studiously avoided), in most modern languages. It occurs in the Anglo-Saxon; and in a work of the thirteenth century, known as the Ormulum, it occurs not only as a matter of course in certain words of which the spelling was known, but as a systematic piece of improved orthography. The author writes thus:—

And whase wilenn shall þis boc,
  Efft oþerr siþe writenn,
Himm bidde icc þatt hett write rihht,
  Swa sum þiss boc himm tæcheþþ;
All þwertt utt affterr þatt itt iss
  Uppo þiss firrste bisne,
Wiþþ all swilc rime als her iss sett,
  Wiþþ alse fele wordess:
And tatt he loke wel þat the
  An boc-staff write twiggess,
Eggwhær þær itt uppo þiss boc
  Is writenn o þat wise:
Loke he well þatt hett write swa,
  Forr he ne magg noht elless,
On Englissh written rihht te word:
  þatt wite he wel to soþe.

§ 52. The letter *h*, preceded by a consonant in the same syllable, is never sounded.

If the previous notices have been read with due attention our remarks may be anticipated. We know what to expect. There

will be the difference between our spelling and our speaking; there will be the apparent exceptions like the *ph* in *Philip*, and the *th* in *thin*. They are all, however, orthographical expedients. A Greek wrote -θιν by means of the single letter θ. Betwen *Philip* and *filip* there is no difference of sound.

What happens when the consonant and *h* are in different syllables? *Mutatis mutandis* our remarks upon the double consonant apply here. In compound words where the latter element begins with -*h*, there is a true double sound, *e. g.* in *hap-hazard*, *ink-horn*, *nut-hook*, *with-hold*, *fool-hardy*, *un-hinge*, &c. In words of this kind the *h* is sounded, but not in words like *philosophy*, *thin*, and *shine*.

§ 53. The number of the letters in the English alphabet is twenty-six.

It is not thought necessary to give the details of the English A B C, nor yet the division of the *letters* into vowels, consonants, &c. or the like. It is not in the *alphabet* that questions of this kind are best studied. Their proper place is the Table of Sounds.

It is clear, however, from what has preceded, that the English alphabet is by no means perfect. The very fact of there being forty sounds to twenty-six letters is enough to prove this. So is the existence of orthographical expedients. It is clear, too, that, in many cases, the spelling does anything but coincide with the pronunciation; in other words, that there is an antagonism between the orthography and the orthoëpy.

§ 54. *C*, *Q*, and *X* are *Superfluous*.

C has two sounds; its sound in the word *city*, and its sound in the word *cat*. The first may be represented by *s* (*sity*), and the second by *k* (*kat*).

Q has the same sound as *kw*, so that *queen* may be spelt *kween*.

X has two sounds; its sound in the word *explain*, and its sound in the word *exist*. The first may be represented by *ks* (*eksplain*), and the second by *gz* (*egzist*).

§ 55. The *ch* in *chest* has a double, or compound sound, and is expressed, accordingly, by a combination of letters. The *j* in *jest* is equally compound as a sound, but is not expressed by an equally compound sign. On the contrary, it is spelt like a simple single sound, by the simple single sign *j*. This is an instance of Inconsistency.

§ 56. The sound of the *ee* in *feet* is erroneously considered to be the long sound of the *e* in *bed;* whereas it is the long sound of the *i* in *pit.*

§ 57. The *i* in *bite* is erroneously considered to be the long sound of the *i* in *pit;* whereas it is a diphthongal sound.

§ 58. The *ou* in *house* and the *oi* in *oil* are erroneously looked upon as the compounds of *o* and *i* and of *o* and *u* respectively; whereas the latter elements of them are not *i* and *u*, but *y* and *w*.

§ 59. The *th* in *thin* and the *th* in *thine* are erroneously dealt with as one and the same sound; whereas they are sounds specifically distinct.

§ 60. The *ch* in *chest* is erroneously dealt with as a modification of *c;* whereas its elements are *t* and *sh*. These are instances of actual Error as to the nature and relation of articulate sounds.

§ 61. Two identical vowels in the same syllable may show that the syllable in which they occur is long—*feet, cool.*

§ 62. Two *different* vowels in the same syllable may do the same—*plain, main.*

§ 63. The addition of the *e* mute may do the same —*plane, mane.*

These are instances of orthographical expedients. Assuredly the English alphabet, along with its application to the English orthography, is far from perfect. On the other hand, some of its deficiencies may be accounted for, and some (perhaps) excused.

The primary object of an alphabet is, of course, to represent the sounds of a language. But besides this, there are in most languages one or more secondary objects besides. Thus,

If we looked to the *sound* only, *city* would be spelt with an *s*- (*sity*). The word, however, is derived from the Latin, where it is spelt with a *c*- (*civitas*). To change this *c* into *s* conceals the origin and history of the word. For this reason it is retained, although,

as far as the mere expression of the sound is concerned, it is a superfluity. The secondary object in this case is an *etymology*.

On the other hand, there is a second principle—*ob differentiam*. When the word *main* (as in *mainland*) is spelt by means of *ai*, whilst *mane* (as *of a horse*) is spelt by means of *a - e*, a distinction is drawn in the spelling which has no existence in the pronunciation, and this difference guards against an ambiguity in language.

But this is not all. In considering its deficiencies, no alphabet should be criticized without a reference to its history.

The following sounds are wanting both in French and German, whilst they occur in English:—

The *th* in *then*.
,, *th* in *thine*.
,, *j* in *judge*.
,, *ch* in *church*.
,, *u* in *duck*.
,, *w* in *will*.

Meanwhile, the following are wanting in English, whilst they occur both in German and French:—

The *u* in *lune*.*
,, *eu* in *neuf*.†

Hence it appears that an alphabet may be very well adapted for one language, without being so well suited to another.

Nearly all the alphabets of Europe are derived from the Latin.

The English alphabet is founded upon the alphabet of the Anglo-Saxons.

The alphabet of the Anglo-Saxons was derived from the Latin alphabet.

In applying the Latin alphabet to the Anglo-Saxon language, the accommodation, without being particularly faulty, was imperfect.

In applying the Anglo-Saxon alphabet to the English, the accommodation was not only imperfect, but faulty.

This arose chiefly from the influence of the Norman Conquest.

The Norman alphabet, although (like the Anglo-Saxon) it was derived from the Latin, was accommodated to a different language; so that the Anglo-Norman and the Anglo-Saxon principles of spelling were conflicting.

The Anglo-Saxon language had a simple single sign for the simple single sound of the *th* in *thin* (þ). This became lost after the Conquest.

The Anglo-Saxon had a simple single sign for the simple single sound of the *th* in *thine* (ð). This also became lost after the Conquest.

* In German, spelt *ü*. † In German, spelt *ö*.

The Anglo-Saxon language spelt words beginning with *ch*, by means of *ce*. The Anglo-Norman spelt them by means of *ch*—*Chester*, *Ceaster*.

Other details could be added, but these are sufficient to show that the imperfections of the English alphabet are not things that have been adopted from choice, but that they are, to a certain extent, the natural results from the history of the language.

ACCENT.

§ 64. Certain differences of sound are called *accents*, and the marks that indicate them are called *accents* also.

To understand the nature of *accents*, the following sentences should be read aloud, and particular attention should be directed to the words in *italics*, as well as to the marks over them. If this be done, it will be observed that in each pair of sentences the same word occurs twice; but it will also be noticed that there is a difference in the pronunciation. The first time that each word occurs, the accent is on the first syllable; the second time it occurs, it is on the last. Furthermore, the word that is accented on the first syllable is a noun; the word that is accented on the second is a verb. When the difference between the nouns and verbs has been explained, the importance of this change of accent will appear. It will then be seen that certain nouns may be converted into verbs, simply by transposing the accent.

1. The *éxports* from London are very great; the *imports* to London are very great also. 2. America *expórts* corn and *impórts* cloth.

1. Honey is an *éxtract* from flowers. 2. You cannot *extráct* honey from all flowers.

1. I have *fréquent* opportunities of visiting home. 2. I *frequént* the playground.

1. This is the *óbject*. 2. I hope you do not *objéct*.

1. These *pérfumes* are agreeable. 2. The flower *perfúmes* the air.

1. This is a *présent*. 2. I *presént* you with this.

1. This is the *próduce* of the farm. 2. Few farms *produce* more.

1. I have a *próject* on my mind. 2. The walls *projéct*.

1. The *rébels* are in danger. 2. He is a bad man who *rebéls*.

1. Take a *súrvey* of the world at large. 2. *Survéy* the world at large.

1. I am in a state of *tórment*. 2. This *torménts* me.

1. He is an *ábsent* man. 2. He is going to *absént* himself.

1. I am going to a *cóncert*. 2. He is going to *concért* a plan with me.

1. This is bad *cónduct*. 2. I hope that I shall *condúct* myself well.

1. Berwick-upon-Tweed is upon the *cónfines* of England and Scotland. 2. He *confines* himself to his studies.

1. There is a *cóntract* between us. 2. All things *contráct* under the influence of cold.

To these instances add the following:—

Nouns.	*Verbs.*	*Nouns.*	*Verbs.*
ábstract	abstráct.	déscant	descánt.
áccent	accént.	dígest	digést.
affix	affíx.	éssay	essáy.
augment	augmént.	férment	ferménт.
cólleague	colléague.	fréquent	frequént.
cómpact	compáct.	íncense	incénse.
cómpound	compoúnd.	ínsult	insúlt.
cómpress	compréss.	pérmit	permít.
cóncrete	concréte.	préfix	prefíx.
cónflict	conflíct.	présage	preságe.
cónserve	consérve.	prótest	protést.
cónsort	consórt.	récord	recórd.
cóntrast	contrást.	réfuse	refúse
cónverse	convérse.	súbject	subjéct.
cónvert	convért.	tránsfer	transfér.
désert	desért.	tránsport	transpórt.

Words accented on the last syllable.—*Brigáde, pretéuce, harpoón, reliéve, detér, assúme, besoúght, beréft, befóre, abroád, abóde, abstrúse, intermíx, superádd, cavaliér*, &c.

Words accented on the last syllable but one.—*An'chor, ar'gue, hísten, fáther, fóxes, smíting, húsband, márket, vápour, bárefoot, disáble, terrífic*, &c.

Words accented on the last syllable but two.—*Régular, an'tidote, for'tify, suscéptible, incontrovértible*, &c.

Words accented on the last syllable but three (rare).—*Régulating, tálkativeness, ábsolutely, lúminary, inévitable*, &c.

The *accent* of words may be expressed in English on a principle like that whereon the *quantities* of words are expressed in Latin and Greek. Thus, if for every accented syllable we write *a*, and, for every unaccented one, *x*—

Words	like	*brigáde*, &c.,	become	*x a*
,,	,,	*ánchor*	,,	*a x*
,,	,,	*régular*	,,	*a x x*
,,	,,	*disáble*	,,	*x a x*
,,	,,	*cavalíer*	,,	*x x a*
,,	,,	*régulating*	,,	*a x x x*

QUANTITY.

By comparing the *a* in *fate* with the *a* in *fat*, we perceive a likeness and a difference. The likeness consists in both sounds having the character of *a;* the difference in the unequal length of the two. In *fate* the vowel is pronounced slowly, so that the time taken up in the utterance is, comparatively speaking, *long*. In *fat* the vowel is pronounced less slowly, so that the time taken up in the utterance is, comparatively speaking, *short*.

Long Vowels.	*Short Vowels.*
a in *father*	. . . .
,, in *fate*	*a* in *fat*
ee in *feet*	*i* in *pit*
oo in *cool*	*u* in *bull*
aw in *bawl*	. . . .
o in *note*	*o* in *not*
. . . .	*u* in *but*

The difference between long and short sounds is expressed by the marks ¯ and ˘.

Long.	*Short.*	*Long.*	*Short.*
bāte	băt	feēt	fĭt
pāte	păt	beāt	bĭt
hāte	hăt	peăt	pĭt
strāit	săd	coōl	bŭll
gāte	glăd	poōl	pŭll

§ 65. In every syllable there must be one vowel sound. In no syllable can there be more than one.

These two facts taken together show that the vowel is the essential part of the syllable. The application of this fact will appear within a few sentences. At present it is necessary to inquire into the length of syllables.

The syllable *men* and the syllable *mend* are of different lengths. The latter is longer than the former by a sound, *i. e.* by the sound expressed by the letter *d*. In both syllables, however, the vowel is the same, and consequently of the same quantity. Thus we see that, as far as the vowel, *taken by itself*, is concerned, the two syllables are of the same length; whilst they are of different lengths if the vowel *be considered along with the consonants that follow it* (*n*, *d*).

Again, the syllable *seen* and the syllable *see* are of different lengths. The latter is shorter than the former by a sound, *i.e.* by the sound expressed by the letter *n*. In both syllables, however, the vowel is the same, and consequently of the same quantity. Thus we see that, as far as the vowel *taken by itself* is concerned, the two syllables are of the same quantity; whilst they are of

different quantities, if the vowel *be considered along with the consonant or consonants that follow it.*

Hence there are two ways of determining the quantity of a syllable.

1st, By the *vowel.*—In this case short vowels form short syllables, even though the number of consonants that follow them be great; and long vowels form long syllables, even though few or no consonants follow.

2nd, By the *vowel and consonant or consonants* taken together. —In this case short vowels constitute long syllables when followed by a number of consonants, and long vowels constitute short syllables when followed by few or no consonants.

In the English language it is the former measure that is adopted; that is, the quantity of the vowel determines the quantity of the syllable.

ETYMOLOGY.

§ 66. ETYMOLOGY exhibits and explains the changes of form which words undergo.

GENERAL VIEW OF COMPOSITION AND DERIVATION.

§ 67. Changes are effected by either Composition or Derivation.

§ 68. When two or more *separate words* are joined together, the result is a *compound;* as, *rose-tree*, *gentleman*, *midshipman*.

It is sometimes difficult to determine whether a word be really compound, *i. e.* whether it be not *two* words. In this case the accent helps us. When it lies equally on each we have *two* words. Where one is more strongly accented than the other we have a compound.

All blúe bélls are not blúebells.
All bláck bírds are not bláckbirds.

§ 69. When a word is changed by the *addition of some new sound*, or by the *change of one previously existing*, it is said to be *derived*.

hunt-*er*	from	hunt	gos-*ling*	from	goose
gird-*le*	,,	gird	drunk-*ard*	,,	drunk
wood-*en*	,,	wood	east-*ern*	,,	east
shad-*ow*	,,	shade	good-*ness*	,,	good
thrif-*t*	,,	thrive	spin-*ster*	,,	spin, &c.

A little consideration shows that this list could easily be enlarged. At present, however, it is enough to show that, whilst Composition consists in the addition of *one whole word to another whole word*, Derivation consists in the addition of *parts of words to whole ones*.

Certain Derivations are called Inflections. They constitute

what is called the Accidents of the Noun and Verb. The full meaning of this will be seen as we proceed. Meanwhile we may state that—

1. The Inflection of a Noun is called its Declension; Nouns being *Declined.*

2. The Inflection of a Verb is called its Conjugation; Verbs being *Conjugated.*

PRELIMINARY LOGIC.—PROPOSITIONS.

However, before these and similar terms can be thoroughly understood, it is necessary to be familiar with certain preliminary facts connected with the structure of *Propositions* and the nature of *Names.* It is most especially necessary to be acquainted with the nature and structure of Propositions; inasmuch as nine hundred and ninety-nine thousandths, at least, of the ordinary discourse of mankind consists of them. Every sentence contains one: many sentences contain more than one. Indeed, it is not too much to say, that where there is no proposition there is no sentence. A few combinations of words, no doubt, are to be found, which fail to deliver a proposition. They are, however, very few. In the so-called Interjections, words like *oh*, *ah*, *pish*, &c., there is none. Neither is there a sentence. In broken and incomplete utterances, there is neither a full sentence nor a proposition; and in the case of the Conjunctions there is and there is not a proposition. Upon this, however, more will appear in the sequel. At present, it is enough to say, that combinations of words which fail to deliver a proposition are extremely rare; and that, as a general rule, discourse consists of propositions, and of nothing but propositions. *Man is mortal,—Summer is pleasant,—Winter is cold,—Life is short,—Art is long,—Fire is hot,—Iron is useful,—Bread is cheap*, to which may be added innumerable others, are all propositions. Moreover, they are all propositions of one sort, and that of the simplest.

For the sake of ascertaining the parts of which propositions consist, let us take two persons talking together.

It is certain that they talk about something,—*e. g. the weather.*

It is also certain that they say something about something,—*e.g.* they say of the weather *that it is hot*, or *that it is not hot.*

One may assert that it is *hot.* In this case the subject spoken of is *the weather*, concerning which there is a fact affirmed, *viz.* that *it is hot.*

The other may assert that it is *not hot;* in which case the subject spoken of is the *weather*, concerning which a fact is *denied*, viz. the fact of its being *hot.*

This gives us two *somethings*—the *something* spoken *about*, and the *something* said concerning it. Thus, in the proposition *man is*

mortal, the quality, property, or attribute, expressed by the word *mortal* is affirmed concerning the being *man;* so that *man* is one part of the proposition, *mortal* another.

Again,—in the proposition *ice is not hot*, the property, quality, or attribute, expressed by the word *hot* is denied of *ice*. *Ice*, therefore, is one part of the proposition, *hot* another.

Summer is pleasant,
Winter is cold,
Life is short,
Iron is useful,
Bread is cheap ;

or,

Summer is *not* pleasant,
Winter is *not* cold,
Life is *not* short,
Iron is *not* useful,
Bread is *not* cheap,

are all examples of the same kind.

There must be something the name of which answers to the question *What are you talking about?*

And, when that is answered, there must also be another something the name of which answers to the question *What do you say about it?*

Thus,—

Q. *What do you talk about?*
A. *The weather.*
Q. *What did you say about it?*
A. *That it was hot.*

or,

A. *That it was not hot.*

To say *summer is*—, *winter is*—, *life is*—, &c., is to combine words to no purpose. The combination conveys no meaning.

To say—*is pleasant*,—*is cold*,—*is short*, &c., is also to combine words to no purpose. The combination conveys no meaning.

But, further, to say *summer—pleasant*, *winter—cold*, *life—short*, is to combine words to no purpose. The combination conveys no meaning. This shows that there are *three* parts in a proposition.

Each of the above-mentioned expressions is imperfect, and it may be seen how it is imperfect.

In the expression *summer is*—, we have the name (*summer*) denoting the object concerning which we affirm something; and we have also the word denoting the existence of an affirmation (*is*). What, however, that affirmation is, is unexplained.

In the expression *is pleasant*—, we find what was wanted in the

previous one, *viz.* an affirmation concerning something. The name, however, of this *something* is wanting.

Lastly, in the expression *summer—pleasant*, although we find both the name of an object (*summer*), and the name of a property, quality, or attribute (*pleasant*), we find no word or sign by which we can tell whether this property, quality, or attribute of *pleasantness* belongs or does not belong to summer ; in other words, there is nothing to show whether the quality expressed by the word *pleasant* is denied or affirmed of the word *summer*. Hence, every proposition consists of three parts.

§ 70. Speech consists of (1) Commands, (2) Questions, and (3) Assertions or Statements. The combination of words by which these are effected is called a Proposition.

§ 71. Propositions which convey Commands are called Imperative ; as, *do this—do not delay—walk.*

§ 72. Propositions which convey Questions are called Interrogative ; as, *what is this?—who are you?—is it here?*

§ 73. Propositions which convey Statements or Assertions are called Declaratory ; as, *summer is coming—I am here—this is he.* Declaratory Propositions are the commonest in discourse.

§ 74. In respect of their structure, Propositions consist of Terms and Copulas.

§ 75. Terms are of two kinds, Subjects and Predicates.

§ 76. The Subject is the Term by which we express the person or thing concerning which the statement is made or the question asked.

§ 77. The Predicate is the Term by which we express what we declare, ask, or command.

There is no Subject without its corresponding Predicate ; no Predicate without its corresponding Subject ; and without both a Subject and a Predicate there is no such thing as a Proposition.

Without Propositions there are no Questions, Commands, or

Declarations; and without Questions, Commands, or Declarations, there would scarcely be such a thing as Language. The little which there would be would consist merely of exclamations like *Oh! Ah! Pish*, &c.

§ 78. In Declaratory Propositions the Subject precedes the Predicate. We say, *fire is hot*, rather than *hot is fire*.

§ 79. In Interrogative Propositions the Predicate precedes the Subject; as *what is this?* rather than *this is what?*

§ 80. In Imperative Propositions the name of the Subject is usually suppressed; *e. g.* we say, *shut the door*, instead of *shut thou the door*. No difficulty, however, arises from the suppression, since the person spoken to is the Subject.

The previous Propositions are *purely* Declaratory, *purely* Interrogative, and *purely* Imperative. In the following the import is mixed:—

1.

May you be happy.

Subject—*You.*
Copula—*be.*
Predicate—*happy.*

Sentences of this kind are called Optative. By more than one good authority, they are placed in a class by themselves as a third species of Proposition. And it cannot be denied that they are expressions of a peculiar character.

Would I could.

This is, also, Optative, meaning *I wish I could;* or, more fully,

I wish
that
I could.

Such being the case, we have two propositions conveyed by three words. There is the omission of the conjunction *that;* and (more remarkable) there is that of the Personal Pronoun as well.

2.

How well you look.

Subject—*You.*

Predicate—*look.*
Copula—involved in Predicate.

Sentences of this kind convey an exclamation of surprise, and have been called Exclamatory.

Optative Propositions are, to a certain extent, Imperative, and, to a certain extent, Declaratory. In expressions like

May you be happy,

change the place of *may* and *you*, and the result is an ordinary assertion,

You may be happy.

On the other hand,

You be happy,

is a command. There is no command, however, without a real or supposed wish on the part of the speaker.

Exclamatory Propositions are, to a certain extent, Interrogative, and, to a certain extent, Declaratory.

3.

In expressions like

How well you look,

change the place of the essential parts, and the result is an ordinary assertion,

You look well.

Meanwhile, *how* indicates the degree or extent of your well-looking. But it only *indicates* it. The degree itself is undefined; and (as such) the possible object of a question; for

How do you look?

is an actual Interrogation.

§ 81. Different words constitute different parts of a proposition.

§ 82. *Sun, winter, bright, cold,* &c., can, *by themselves and without the addition of any other word,* constitute terms.

§ 83. *A, an, the, brightly, from, and,* &c., can only form *parts of terms.* We can say, *the fire is bright.* We can *not* say, *the is bright, fire is the,* &c.

§ 84. Other words are capable of forming, *by themselves and without the addition of any other word,* terms, *and something more, e. g.* water *boils.* Here

boils = *is boiling*, and serves for predicate and copula as well.

§ 85. Others, without entering into any *single* term, or proposition, may stand between *two*.

All men are black *or* white.
The water is boiling,
because
The fire is blazing.

§ 86. Others, like *oh*, *pish*, *ah*, may exist without forming, or helping to form, or connecting propositions at all. The class, however, to which these and their like belong is not very important.

The following words, amongst many others, are capable of forming, by themselves, Subjects:—

man	bow	wealth
mother	fishing-rod	length
daughter	hunter	fire
horse	shooter	water
dog	book	soul
ox	pen	atmosphere
ass	ink	firmament
bird	virtue	sky
egg	vice	essence.

The following words, amongst many others, are capable of forming, by themselves, Predicates:—

good	deep	shooting
great	happy	laughing
red	womanly	conquered
hot	fatherlike	moved
cold	bodily	beaten
weak	atmospheric	drifted
strong	essential	sifted.

The following words, amongst others, are capable of forming, by themselves, both a Predicate and a Copula, at once:—

eat	teach	shoot
die	petrify	laugh
see	sigh	murmur
hear	hunt	astonish
speak	fish	pine
hunger	impeach	beat.

Of the following words not one can form a term by itself; that is, not one of them can be either Subject, Predicate, or Copula, so long as it stands alone. No one says *wisely is good*, *from is black*, *man is wisely*.

wisely	then	in
justly	to-morrow	over
slowly	of	through
once	for	near
twice	by	on
thrice	with	about, &c.

NAMES.

§ 87. *Substance and Attribute—Abstract and Concrete.*—We now come to four terms, that mutually illustrate each other. They run in pairs, (1 and 2) *Substance and Attribute;* (3 and 4) *Abstract and Concrete.*

Let us take, in the way of illustration, an orange. It strikes our senses. We see that it is more or less *round*, that it is more or less *yellow*, that it is more or less *smooth*. Our *eyes* tell us all this. They tell a great deal more; but this it is unnecessary to enlarge on. By our *ears*, we detect a sound if we rub the skin with our fingers. We *smell* it and find a peculiar and not unpleasant aroma. We *taste* it and are gratified by a not unpleasant flavour. We *feel* that it is elastic, or endowed with the attribute of elasticity. We feel, too, that it has a certain figure and size. We feel, too, that it has a certain weight. On the strength of all this we say that an orange is *round*, *yellow*, *smooth*, *capable of exciting sounds*, *fragrant*, *sapid*, *elastic*, &c., and when we say that an orange is this, we *attribute* to it certain properties, or qualities. What are they? We do *not* say that an *orange has the property of round*, *yellow*, *smooth*, &c. On the contrary, we say that it has the property of *round-ness*, *yellow-ness*, *smooth-ness*, &c.

So much for the attributes of an *orange;* at least, for some of them. The attributes of a *guinea*, a *loaf*, a *man*, a *fish*, or anything else, may be considered in the same way. They are, of course, when taken altogether, different from those of an orange. The principle, however, of considering them is the same.

And now, let us divest the orange of all its attributes *without supplying it with new ones.* Take away its original colour without

replacing it by any fresh one. Let it lose its softness without becoming hard, its roundness without becoming of any other form. Annihilate its weight, taste, and smell. Let it have no means of appealing to eye, ear, taste, smell, or touch, so that it become, at one and the same time, impalpable, invisible, imperceptible. What will it be then? Will it be anything at all? What becomes of the attributes? What becomes of the orange? Is it annihilated by the abstraction of its attributes, one and all? Few are prepared to say *yes* to this question. Few divest themselves of the notion that sensible, and material, objects are nothing more than the combination of certain properties, qualities, and attributes, each and all of which may be removed in such a way as to leave an absolute nothing. We rather imagine that, where there are certain attributes in union, there is a certain link which connects them; a basis or foundation which supports them; a basis or foundation different from the attributes themselves,—something, which they are not, but something upon which they rest. This *something supports* them. This *something* stands *under* them. This *something* is the *sub-stance*, or *under-standing*, of objects, as opposed to, and contrasted with, their *attributes*.

Concrete terms are the names of Substances; whilst Abstract terms are the names of Attributes; *e. g.*:—

Abstract.		Concrete.
Brightness, *Heat*, *Light*, *Mortality*, *Vitality*, *Animality*, *Solidity*, *Resistance*, *Fluidity*, &c.	are Attributes of the Substances	*Sun*. *Fire*. *Spark*. *Animal*. *Man*. *Horse*. *Wood*. *Stone*. *Water*, &c.

Vice versâ.

Concrete.		Abstract.
Sun, *Moon*, *Stars*, &c. *Man*, *Horse*, &c.	are Substances with the Attributes	*Brightness*. *Heat*. *Warmth*. *Mortality*. *Animality*.

§ 88. Besides Abstract or Concrete, Names are Invariable or Variable.

Words like *stone*, *tree*, *man*, &c., denote certain objects which constitute a class, including an indefinite number of individuals.

To any of these the name may apply. It cannot, however, apply to an object belonging to a different class. It is nonsense to call a *tree* a *stone*, or a *stone* a *tree*. Each name applies to the individuals of a certain group, and, as it cannot be applied otherwise, it is an *invariable* name.

All names, however, are not invariable. The word *I*, for instance, is *variable*. It changes its meaning with the person speaking. When William says *I*, it means William; when John says *I*, it means John. So, again with *you*—it denotes the person to whom I happen to be speaking at the moment: but the next moment I may alter its meaning by speaking to some one else. The same applies to *that*, *this*, *these*, and several other words.

If a *mother* say *I*, it means a *mother* and a *female;* if a *father* say *I*, it means a *father* and a *male*. Even if an inanimate object be personified, and be supposed to speak about itself and to say *I*, it means that inanimate object. It denotes the speaker, whoever he may be; but it is not the invariable name of any speaker whatever. Or, it denotes the object spoken of, whatever it may be; but it is not the invariable name of any object whatever. The word *this* means a *table*, when the speaker is talking of *tables*, a *dog* when he is talking of *dogs*, &c.

PARSING—GRAMMATICAL AND LOGICAL.

§ 89. *Parsing* is of two kinds, Grammatical and Logical.

§ 90. *Grammatical* Parsing deals with the words which constitute sentences, as so many Nouns, Pronouns, Verbs, Participles, and the like; taking cognizance of them as *Parts of Speech*. Hence, such a sentence as

Man is mortal,

consists of (1) *man*, a Substantive in the Nominative Case and the Singular Number; (2) *is*, a Verb in the third person of the Singular Number, of the Present Tense, of the Indicative Mood; and (3) *mortal*, an Adjective.

In many instances, Grammatical Parsing is carried further. This may be seen in words like *hunter's*, *gifts*, *sparkling*, &c., &c. In each of these there are three elements; the words being divided thus, *hunt-er-'s*, *gif-t-s*, *spark-l-ing*.

The last is an *Inflection*—the *'s* in *hunter-'s* being the sign of the Possessive Case; the *s* in *gif-t-s* being that of the Plural Number; the *ing* in *spark-l-ing* that of the Present Participle.

These being taken away, there remain *hunt-er*, *gif-t*, and *spark-le;* words which carry with them no signs of Case, Tense, or the like. On the contrary, they are words to which such signs may be attached. Many grammarians call them crude forms. The present writer prefers to call them *themes*—a theme being a word capable of inflection, but not inflected.

The themes themselves, however, may be secondary forms. They are so in the instances just given. *Hunt-er* is derived from *hunt; gif-t* from *give; spark-le* from *spark.* It is possible that these words may themselves be derivatives also; but until they are shown to be so, they are treated as *roots, i. e.* as words from which themes and inflections may be derived, but which are themselves ultimate forms.

As a general rule we stop at the root. If it were not so, we could scarcely call it the ultimate form. The root itself, however, may occur in an older stage of the language than the one under notice; or it may occur in some allied language; or it may occur in a different form; or with a modification of sense. In cases, however, like these, we have a question for the advanced student; for the comparative philologue rather than for the beginner.

Practice.

1.

It is an ancient mariner,
  And he stoppeth one of three:
By thy long grey beard and glittering eye,
  Now wherefore stops't thou me?

2.

The bridegroom's doors are open wide,
  And I am next of kin;
The feast is set; the guests are met;
  Mays't hear the merry din.

Coleridge.—*Ancient Mariner.*

It is the Nominative, Singular, Neuter of *he*, a Pronoun originally demonstrative, but now used personally. *He* originally meant *that person.* The neuter was formed by adding *-t*; so that *hi-t* meant *that thing.* In the modern language the initial *h* is lost. The A. S. form, however, was *hit.* The inflection *-t* is the same as the *-d* in the Latin *id.* Compare,

Latin—*is, ea, id.*
A. S.—*he, heo, hit.*

The root is *e* or *i*, either alone or preceded by a breathing.

Is—Third, Singular, Present. The root is a very old one, being found not only in all the German tongues, but also in the Latin, Greek, Sanskrit, Lithuanic, and Slavonic.—See § 158.

An—Indefinite Article. Originally the Numeral *one*. Root old, being found in the Latin *un*-us, Greek ἑ-ν, Lithuanic, *ven*-s, &c.

Ancient—Adjective: a word derived from the French.

Mariner—Substantive. The root is *m-r* = *sea*.

And—Conjunction.

He—See *it*.

Stoppeth—Third, Singular, Present, Indicative, from *stop*. Rhetorical, poetic, archaic, rather than modern or colloquial in form. The ordinary word is *stop-s*. The *-eth*, or *-s*, is an inflection. *Stop* is the theme, and (probably) the root also.

One—Numeral.—See *an*.

Of—Preposition.

Three—Numeral. The root is common to the Latin, Greek, and other languages—*tres*, τρεῖς, &c.

By—Preposition.

Thy—Possessive Case of *thou*, Pronoun of the second person. It corresponds with the Latin *tui*, not with *tuus*, *tua*, *tuum*. Hence, *thy long beard* = *tui longa barba* = *the long beard of you*.

Grey—Adjective.

Beard—Substantive.

And—Conjunction.

Glittering—Participle Present, from *glitter* (theme). Root *glit*. Though this word is not known to occur, its existence is inferred from the derivational character of the *-er*.

Eye—Substantive.—Comparative philology tells us that the *-y* represents a *-g*. The A. S. form was *eáge*: the German is *auge*. This is the Latin *oc- ul- -us* (*oculus*)—where *-us* is the inflection; *-ul*, the theme (or crude form); and *oc-* the root.

Now—Adverb.

Wherefore—A Conjunction. A compound word = *where* + *for*. Originally *where* was the Dative Singular Feminine of *who*; *-re* being an inflection. The *wh-* is the *qu* in the Latin *qui*, the *k* in the Greek κ-οῖος, κ-ότερος, &c., the root being one of the oldest in the language.

Stoppest—See *stoppeth*. The *-st* is the sign of the Second person Singular, and an inflection.

Thou—Nominative Singular—See *Thy*. The root a very old one, = the *tu* in Latin and other languages.

Me—Pronoun of the First Person, truly Personal—Accusative Case. Root old. Compare *me* in the Latin and other languages.

The—Definite Article. Same root as in *th-is*, *th-at*, &c.

Bridegroom's—Possessive Case, Singular Number of *bridegroom*, a Substantive.

Doors—Nominative Plural from *door*, a Substantive. Theme *door*. Root *d-r*, an old one, being the Greek θυρ-α, the Latin *for-es*. The *-s* in *doors* is inflectional.

Are—Third plural present, from root of *am* and *is*.

Open—In form a Participle from *ope;* in sense an Adjective.

Wide—Adjective.

And—Conjunction.

I—Pronoun of Third Person, truly Personal, Uninflected ; inasmuch as *me*, *my*, &c., have no etymological connection with it. A modified form of a root ending in the sound of *-g* or *-k* ; being in A. S. *ic*, in Latin and Greek *eg-o*, and εγ-ω.

Am—See *are* and *is*.

Next—Adjective in the Superlative Degree ; from *nigh*.

Kin—Substantive. A very old root ; being the *gen-* in the Latin *gen-us*, and Greek γεν-ος.

The—Definite Article. Undeclined.

Feast—Substantive.

Is—See above.

Set—Past Participle, from *set*.

Guests—Nominative Plural. The *-s* is an inflection, *guest* being the theme or crude form.

Met—Past Participle from *meet*.

Mayest—Second Singular, from *may*. The *-y-* represents *-a*, *-g*, the A. S. forms being *mag*. The root is the *mag* in the Latin *mag-nus*, and denotes power. The full construction would be *thou mayest*. The Personal Pronoun, however, is omitted.

Hear—Infinitive Verb—*not* preceded by *to*.

Merry—Adjective root *m-r*,—as is shown by the form *mir-th*. The *-y* represents an A. S. *ig*—See p. 92.

Din—Substantive.

§ 91. *Logical* Parsing deals with the words which constitute propositions as Terms and Copulas; taking cognizance of them as Subjects or Predicates, or as parts thereof. Under this view the sentence

Man is mortal,

contains

Man	Subject.
Mortal . . .	Predicate.
Is	Copula.

PARTS OF SPEECH.

§ 92. The place that a word takes in a proposition, *combined with the principle on which it takes it*, determines the class to which a word belongs as a part of speech, *i. e.* as a Substantive, Adjective, Verb, Conjunction, and the like.

The words in italics are important. Although position itself is *generally* sufficient to determine the character of a word, it is not so *always*. The words *I* and *father* can equally, by themselves and without the addition of any other word, constitute *either* subject or predicates, as (1) *I am coming—it is I.* (2) *Father is coming—it is father.* Yet *I* is a pronoun, whereas *father* is a substantive.

AMOUNT OF INFLECTION IN ENGLISH.

How far have we Genders in English?

The distinction of sex by wholly different words, such as *boy* and *girl; father* and *mother; horse* and *mare*, &c., is *not* gender. Neither are words like *man-servant, he-goat*, &c., contrasted with *maid-servant, she-goat*, &c.

The Latin words *genitrix* = *a mother*, and *genitor* = *a father*, give an approach to gender rather than gender itself. This is because the difference of sex, though shown by the syllables *-or* and *-ic* is not shown in the inflection.

	Singular.		*Plural.*		
Nom.	Genitor	Genitrix.	*Nom.*	Genitor-*es*	Genitric-*es*.
Gen.	Genitor-*is*	Genitric-*is*.	*Gen.*	Genitor-*um*	Genitric-*um*.
Dat.	Genitor-*i*	Genitric-*i*.	*Dat.*	Genitor-*ibus*	Genitric-*ibus*.
Acc.	Genitor-*em*	Genitric-*em*.	*Acc.*	Genitor-*es*	Genitric-*es*.
Voc.	Genitor	Genitrix.	*Voc.*	Genitor-*es*	Genitric-*es*.

Contrast with this the words *domina, a mistress*, and *dominus* = *a master*.

	Singular.		*Plural.*		
Nom.	Domin-*a*	Domin-*us*.	*Nom.*	Domin-*æ*	Domin-*i*.
Gen.	Domin-*æ*	Domin-*i*.	*Gen.*	Domin-*arum*	Domin-*orum*.
Dat.	Domin-*æ*	Domin-*o*.	*Dat.*	Domin-*abus*	Domin-*is*.
Acc.	Domin-*am*.	Domin-*um*.	*Acc.*	Domin-*as*	Domin-*os*.
Voc.	Domin-*a*	Domin-*e*.	*Voc.*	Domin-*æ*	Domin-*i*.

Here the letters in italics, or the signs of the cases and numbers, are different. Hence, it is evident that, if *genitrix* be a specimen

of gender, *domina* is something more. It is a specimen of true gender.

How far have we Numbers in English?

We have a Singular and a Plural; but no Dual—none, at least, in the present English. In the Anglo-Saxon, however, there *was* an approach to one: *wit* = *we two; git* = *ye two*. Why is this only an approach? Because *git* is, really two words, *ye two* in a contracted form. There is no dual in the present German. In the ancient German there *was* one. In the present Danish and Swedish there is no dual. In the Old Norse and in the present Icelandic a dual number is to be found. From this we learn that the dual number is one of those inflections that languages drop as they become modern.

Over what extent of language have we a plural? The Latins say, *bonus pater* = *a good father; boni patres* = *good fathers*. In English it is only the substantive that is changed. Hence, in the Latin language the numbers were extended to adjectives; whereas in English they are confined to the substantives and pronouns. In the Anglo-Saxon, however, there were plural forms for the adjectives.

How far have we Cases in English?

This depends on the meaning we attach to the word. In *a house of a father*, the relation between the words *father* and *house* is expressed by the preposition *of*. In *a father's house*, the relation, or connection, is conveyed, not by a preposition, but by a change of form, *father* becoming *father's*. In *the father taught the child* there is neither preposition nor change of form; and the connection is denoted by the arrangement only.

Now if the relation alone between two words constitute a case, the words or sentences, *child; to a father; of a father; and father's*, are all equally cases; of which one may be called the accusative, another the dative, a third the genitive, and so on. The relationship alone does *not* constitute a case.

For etymological purposes it is necessary to limit the meaning of the word; and, as a sort of Definition, it may be laid down that *where there is no change of form there is no case.*

INFLECTION OF PRONOUNS.

§ 93. Pronouns fall into three classes. In the first, the Declension is purely Pronominal; in the second it is that of a Substantive; in the third it is that of an Adjective; *i.e.* it is nothing at all.

Now although this last is a negative fact, it is well to note it in a positive and decided manner; inasmuch as the differences in the

declension of pronouns coincide with certain differences of power. Whilst words like *same* and *any* are both in import and in the want of declension closely akin to the Adjective, whilst *self*, with its plural *selves*, is Substantival, the typical Pronouns like *who* or *I*, &c., are neither one nor the other, either in sense or inflection; but members of a class, *per se*.

§ 94. The Adjectival Pronouns with the *no*-declension may be disposed of at once. They are *same*, *any*, *many*, and others. Their place is the dictionary rather than the grammar. Though now undeclined, they were declined in A. S.

§ 95. The Substantival Pronouns are *self*, *other*, and *one*.

(1.)

Sing.		*Plur.*	
Nom.	Self	*Nom.*	Selves.
Poss.	Self's	*Poss.*	Selves'.

Declined like *shelf*.

(2.)

Sing.		*Plur.*	
Nom.	Other	*Nom.*	Others.
Poss.	Other's	*Poss.*	Others'.

Declined like *mother*.

(3.)

Sing.		*Plur.*	
Nom.	One	*Nom.*	Ones.
Poss.	One's	*Poss.*	Ones'.

Declined like *swan*.

The identity of form between the words *one* the indefinite pronoun and *one* the numeral is entirely accidental. The numeral *one* = *unus*, and has no plural number. The word under notice is from the French, and is the *on* in such expressions as *on dit*; this being, in its turn, from the Latin *homo* = *man*. The German for *on dit*, at the present time, is *man sagt* (*man says*); and until the Norman Conquest the same mode of expression prevailed in England.

One is often called the Indeterminate Pronoun. It is used in the Possessive Case, and in the Plural Number in such expressions as—*One is unwilling to put one's friend to trouble.*—*My wife and little ones are well.*—*These are my two little ones' playthings.* Such forms as *self's* and *selves'* are undoubtedly rare. At the same time they are possible forms, and, if wanted, are strictly

grammatical. Substitute the word *individuality* for *self*, and we see how truly its nature is *substantival*.

§ 96. The purely pronominal forms fall into two classes. Of the first, *who*, of the second, *thou* is the type.

The small, but important, class to which *who*, with its congeners, belongs, gives two Numbers, more than two Cases, and, in its fuller form, three Genders—three *true* Genders.

It gives two Numbers ; a Singular and a Plural, as *this*, *these*.

It gives, at least, three Cases: a Nominative *who*, a Possessive *whose*, and an Objective *whom*.

Finally, it gives, at least, two true Genders and fragments of a third. One of these Genders is a Neuter.

§ 97. The neuter ends in *-t*, and in the three words wherein it occurs we have the pronominal inflection in its typical form.

The first division contains—

1. The Interrogative ;
2. The Relative ;
3. The Demonstrative Pronouns ;

all declined on the same principle. For this reason they form a natural group : because they best exemplify the pronominal inflection, they come first.

The Interrogative comes before the Relative, because it is, apparently, the older part of speech. In our own, and many other languages, these two Pronouns are identical. In the Irish Gaelic, however, they are different ; and in more than one other tongue there is no Relative at all. The Interrogative, however, is universal. Though there are several languages which have an Interrogative without a Relative, I know of none where there is a Relative without an Interrogative.

The present declension of the Demonstrative Pronouns is as follows :—

(1.)

He.

	Masc.	*Neut.*	*Fem.*
Nom.	He	It	—
Obj.	Him	It	Her.
Poss.	His	—	Her.
Secondary, or Predicatively Adjectival, Poss.	—	Its	Hers.

No plural form.*

(2.)

She—Defective in the oblique cases.

(3.)

That.

Sing.	*Nom.*	That	*Plur.*	*Nom.*	They
	Obj.	That		*Obj.*	Them
	——			*Poss.*	Their
	——			*Secondary, or Predicatively Adjectival, Poss.*	Theirs.

Hira was the A. S. Genitive Plural.

That *it*, notwithstanding the loss of the initial breathing, is a true inflection of *he* we learn from the A. S., where the genders run Masc. *he*, Fem. *heo*, Neut. *hit*.

Its.—This is not only a catachrestic form, but a recent one. It is in English such a form as *idius*, or *illudius*, instead of *ejus* or *illius* would be in Latin; giving us an inflection engrafted upon an inflection, *i. e.* an *-s* as the sign of the Possessive Case attached to a *-t* as the sign of the Neuter Gender.

Hoo.—The A. S. heo = she.—Though replaced in the present language by *she*, the A.S. *heo* is still to be found as a provincialism —generally as *hoo*.

Him.—Now objective, *i. e. either* dative or accusative. Originally, dative only.

Hyne.—In A. S. the accusative was *hyne*, now obsolete, though not extinct. It is the *en* (= *him*) of the Dorsetshire dialect.

She.—At present this word is uninflected. In A. S., however, it was a truly feminine form, from *se*. It had not, however, its present power; but rather coincided with the definite article, which, in Greek, ran—

Se = ὁ
Seo = ἡ
Thæt = τὸ

The language in which we have the fullest inflection of *s* is the Lithuanic, wherein it has the following Numbers, Genders, and Cases:—

Singular.

	Masculine.	*Feminine.*
Nominative.	szìs	szì
Accusative.	szi	szié
Locative.	sziamè	sziojè
Dative.	sziám	szeì
Instrumental.	sziùm	sziè
Genitive.	szió	sziós

	Dual.	
Nominative.	sziŭ̆du*	szẽdoi
Accusative.	sziŭ̆du	szëdoi
Dative.	szëmdvëm	sziómdoëm
Instrumental.	szemdvëm	sziomdvem
Genitive.	sziudvëjú	sziudvëjú
	Plural.	
Nominative.	szẽ	sziós
Accusative.	sziŭs	sziès
Locative.	sziŭsè	szïosè
Dative.	szẽms	sziómis
Instrumental.	szeís	sziomìs
Genitive.	sziú	sziú

The Demonstrative for objects in the far distance is *yon*. It is only its history which brings the word in its present class. Looking to its declension only, it belongs to the adjectival pronouns. *Historically*, however, it is a word of importance. It is an old one. It is German, being the *jen-* in *jen-er*. It is the Lithuanic *anás*, = *yon;* and, in both the German and the Lithuanic, it is declined in full. The declension, however, in English is obsolete.

The name for objects near enough to be considered at-hand, and, at the same time, far enough to be separated from anything within touch (there or thereabouts), yet not in the vague distance, is √*th*, or the root *th-*, as in *this* and *that*. I can devise no better exposition than this. The word in question is not *this*, is not *that*, is not *the*. It is something which, without being either one or the other exactly, gives us all three.

The details between *these* and *those* are obscure. At the present time *those* is the plural of √*th-* ; of which the neuter is *that*. In like manner *these* is the plural of *this;* a word which is declined on the same principle as the preceding. Hence it had *þisne* (provincial *thisn*) as an accusative, *þisum* as a dative, *þises* as a genitive, *þissa* as a genitive plural. In some of the allied dialects we find the feminine and genitive plural forms in *-re*, and *-ra*, as *þisre*, *þisra*. Now it is clear that in *these* the *-s* is no inflection, but a radical part of the word, like the *s* in *geese*. But what of the final *e?* Was it mute? If so, it is a mere point of spelling. Dr. Guest, however, has made this view untenable, and shown that, in the Old English at least, it was an actual sign of number.

When *thise* Bretons tuo were fled out of *this* land.—Robert of Bourne.

This is thilk disciple that bereth witnessyng of *these* thingis, and wroot them.—Wicliffe, John xxi.

* Meaning √*sh* + *two*.

Say to us in what powers thou doist *these* thingis, and who is he that gaf to thee *this* power.—WICLIFFE, Luke xx.

The word *the* in such expressions as *all the more*, is a different word from the article *the*. It originated in the A.S. *þy*, an Instrumental Case of *this*, and exactly corresponds with the Latin *eo* in *eo majus*.

Upon the whole, the Demonstratives are declined like the Interrogatives. No wonder. They answer to them.

Question. *What* is that?

Answer. It is *this*, *that*, *he*, *she*, or *it*, as the case may be.

Upon the whole, the two sections belong to the same class; though there are details in which they differ. All, however, have a neuter in *-t*; as *wha-t*, *tha-t*, *i-t*.

And now the neuter termination *-t* commands attention. Although, in the English language, it is found in three pronouns only, the form is an important one. In the Mœso-Gothic it pervades the whole inflection of adjectives; so that their neuters end in *-ta*, just as truly as the Latin neuters end in *-um*, or the Greek in *-ον*.

Masc.	*Fem.*	*Neut.*
Blind-*s*,	blind-*a*,	blind-*ata*;

like

Masc.	*Fem.*	*Neut.*
Cæc-*us*,	cæc-*a*,	cæc-*um*.

In Norse, too, at the present moment, *all* neuters end in *-t*. *skön* = *pulcher*, *sköntt* = *pulchr-um*. In the modern High-German this *-t* becomes *-s*, M. *blind-er*, N. *blind-es*. But it is the Latin *-d*, in *i-d*, *illu-d*, *istu-d*—and, as such, a very old inflection. And now comes a fact which, whilst it justifies the importance and prominence given to the pronominal inflection, of which this neuter in *-t* has been the characteristic, shows us how, in languages of the same order, a mere alteration in the distribution of certain inflections may effect a great change. There are two types of inflection in the way of Gender, one given by the Substantives, the other by the Pronouns. The Adjectives have none of their own. They take that of the Substantive, or the Pronoun, according to the language. The *Latin* adjectives, along with the *Greek*, follow the substantives, the result being *cæc-us*, *cæc-um*, like *dominus*, *regn-um*. The *German* adjectives follow the pronouns; the result being *blind-s*, *blind-ata*, like *who*, *what*.

§ 98. *Ours*, *yours*, *hers*, *theirs* are of recent origin, and are formed after the manner of possessive cases, as is shown by their termination. But as *our*, *your*, *her*, and *their* were themselves possessive, we have, in the words under notice, instances of a case formed

on a case. The analysis, then, is *ou-r-s*, *you-r-s*, *he-r-s*, *thie-r-s*.

The INDEFINITE Pronouns are, one and all, without declension. The history, however, of many of them is important. Some are compounds, though the fact of their being so is disguised.

Such.—The Anglo-Saxon form is *swylc*. In the Old Saxon (*i. e.* the Saxon of Germany), we find *sulîc*. That this is *so-like* is shown by the still older form *svaleiks*. A similar combination has already been noticed, viz. *which* for *who-like*.

Each.—The fuller forms are *ælc*, *jeglich*, and *iegelich*, all of which contain the sound of *l*, now lost. This shows that *each* is, also, a compound of *lik* or *like*. In Scotch, the word *ilka*, in the sense of *each one*, still represents the Anglo-Saxon.

Which.—In like manner *which* is *whi-lik*, in Scotch *whilk*, being no true neuter of *who*, but a compound. The true neuter of *who* is *wha-t*.

Aught in the sense of *anything.*—The fuller forms of this word are *âwet*, *awiht*, *êowiht*, in which we have the almost obsolete substantive *whit*, as in the phrase *not a whit*. By prefixing the negative sign *n* we get—

Naught in the sense of *nothing*.

Any.—The fuller and older form is *ænig*, from *án* = *one*.

THE NUMERALS.—The Ordinal numbers are formed from the Cardinals.

Between *one* and *first* there is no etymological relation. *First* is a superlative form, derived from the root *fore;* in Anglo-Saxon, *fyrmest*.

Between *two* and *second*, there is no etymological relation. *Second* is from the Latin *secundus*, meaning the *following*.

Third, *fourth*, &c., are derived from *three*, *four*, &c., by the addition of *th*, subject to slight variations. In *third*, *th* becomes *d*, and the letter *r* is transposed. In *fifth*, the vowel is shortened.

The difference between the termination *-teen* and *-ty*, as they appear in the words thir-*teen* and thir-*ty*, requires notice. In both cases they are connected with the word *ten*. Indeed, they may be said to mean *ten*. They differ, however, in their way of doing so. *Teen* means simply *ten;* so that *thirteen* is *three* and *ten*. *Ty*, however, was originally *tig*, and meant a *collection of ten*, just as *sixpence* means a single *sixpenny piece* rather than six separate pennies. Hence, *thirty* means *three collections of ten*.

INFLECTION OF SUBSTANTIVES.

§ 99. The A. S. Possessive *Singular* ended in *-es;* as *cyning*, *cyning-es* = *rex*, *reg-is*. The A. S. Nomi-

native *Plural* ended in *-as*, as *cyning-as* = *reg-es* The present English ejects the vowel, and reduces the two cases to the same form. It distinguishes them, however, in the *spelling;* inasmuch as we write *kings* = *reg-es*, but *king's* = *regis*.

§ 100. The Possessive *Plural*, in A.S., ended in *-a;* as *cyning-a* = *regum*. The present English rarely forms a *real* Possessive Plural at all. When it does, it adds the *-s* of the Singular to the Nominative Plural; as *ox-en, ox-ens*.

But this is only done with those few words where the Nominative Plural does *not* already end in *-s; men, men's; brethren, brethren's; children, children's*. If it were not so we should have such expressions as *the fatherses children, the sisterses brethren, the masterses men*.

In *writing*,

The fathers' children means *the children of one father;*	*The master's men, the men of one master;*
The sister's brethren, the brethren of one sister;	*The owner's oxen, the oxen of one owner.*

Whilst—

The fathers' children means *the children of different fathers;*	*The masters' men, the men of different masters;*
The sisters' brethren, the brethren of different sisters;	*The owners' oxen, the oxen of different owners.*

§ 101. Subject to a few exceptions, and the rules of euphony,* the Plural of Substantives is formed from the Singular by adding *-s*, as in *father, father-s*.

* The rules of euphony are—

(1.) Two mutes, one of which is surd and the other sonant, coming together in the same syllable, cannot be *pronounced*.

(2.) A surd mute, immediately preceded by a sonant one, is changed into its sonant equivalent.

(3.) A sonant mute, immediately preceded by a surd one, is changed into its sonant equivalent.

(4.) In certain cases, a vowel or a liquid has the same effect upon the surd letter *s*, as a sonant mute. Thus,

Hills is pronounced *hillz*.
Stems „ *stemz*.

The plural of—

wife	*is not*	wifes*	*but*	wives†
loaf	,,	loafs	,,	loaves
knife	,,	knifes	,,	knives
half	,,	halfs	,,	halves
life	,,	lifes	,,	lives
leaf	,,	leafs	,,	leaves
calf	,,	calfs	,,	calves.

If we ask the reason of this peculiarity, we shall find reason to believe that it lies with the *singular* rather than with the *plural* forms. In Anglo-Saxon, *f* at the end of a word was, probably, sounded as *v;* and it is likely that the original *singulars* were sounded *loav*, *halv*, *wive*, *calv*, *leav*. In the Swedish language the letter *f* has the sound of *v;* so that *staf* is sounded *stav*. Again, in the allied languages the words in question end in the *sonant* (not the *surd*) mute,—*weib*, *laub*, *calb*, *halb*, *stab*, &c. = *wife*, *leaf*, *calf*, *half*, *staff*.

Pence.—A contracted form from *pennies;* and collective rather than plural. *Sixpence*, compared with *sixpences*, is no plural, but a singular form.

Dice.—This distinguishes *dice* for play from *dies* for coining. *Dice*, like *pence*, is collective rather than plural.

Eaves.—In A. S. *efese:* so that *-s* belongs to the root.

Alms.—In Anglo-Saxon *ælmesse.*

Riches.—This is from the French *richesse*, so that the *-s* is no sign of the plural number, but is part of the original singular, like the *-s* in *distress.*

News.—Here the *-s* (unlike the *-s* in *alms* and *riches*) is no part of the original singular, but the sign of the plural, like the *s* in *trees.* Notwithstanding this, we cannot subtract the *s*, and say *new*, in the same way that we *can* form *tree* from *trees.*

Means.—From the French *moyen*, *moyens.* The singular form *mean*, as in the phrase *the golden mean*, means *middle course.*

Pains.—In the original French *peine*, *peines.*

Amends.—The form in French is *amende*, without the *s.*

Mathematics, metaphysics, politics, ethics, optics, physics.—Let

Horns	is pronounced	*hornz.*
Stars	,,	*starz.*
Boys	,,	*boyz.*

(5.) When two identical or cognate sounds come together in the same syllable, they must be separated from each other by the insertion of the sound of the *e* in *bed*—*loss*, *loss-es; blaze*, *blaz-es.* Here we must remember, not only that *z*, *zh*, and *sh* comport themselves as *-s*, but the *-ch* in *church*, &c., and *-ge* in *judge*, &c., are really *tsh* and *dzh*, whence *church-es*, *judges*, &c. In *monarch*, &c., the *ch* is not *tsh* but *k* (*x*): the plural being *monarchs.*

* As if written *wīfce*, &c. † As if written *wīvz*, &c.

the arts and sciences of Greece be expressed by a substantive and an adjective combined, rather than by a simple substantive; for instance, let it be the habit of the Greek language to say the *musical art*, rather than *music*. Let the word for *art* be of the feminine gender; *e.g.* τέχνη, so that the *musical art* be ἡ μουσίκη τέχνη. Let the article and substantive be omitted; so that, for the *musical art*, or for *music*, there stand only the feminine adjective. Let there be a series of books, or treatises; the Greek for *book*, or *treatise*, being a neuter substantive, βίβλιον. Let the substantive meaning *treatise* be, in the course of language, omitted; so that whilst the science of *physics* is called φυσίκη, from ἡ φυσίκη τέχνη, a series of treatises upon the science shall be called φύσικα, or *physics*. In this we have an explanation of the preceding forms. *Physic* and *Logic*, &c., give the names of the art or science, *Mathematics*, *Optics*, &c., the names of the treatises upon them.

§ 102. *Plurals not ending in* -s.—Besides the usual plural forms in *s* (*father-s*, *son-s*), there are four other methods in English of expressing a *number* of objects.

1. By the change of a vowel.
2. By the addition of *-en* or *-n*.
3. By the addition of *-er* or *-r*.
4. By a combination of some two of the preceding methods.

§ 103. *Plurals formed by a change of vowel.*—This class consists in the present English of the following words:

1. *Man*, *men*. The vowel *a* changed to the vowel *e*.

2. *Foot*, *feet*. The vowel *oo* (sounded as the *ou* in *could*) changed to the vowel *ee*.

3, 4. *Tooth*, *teeth*; *goose*, *geese*. The vowel *oo* (as in *food*) changed to *ee* as in *feet*.

5, 6. *Mouse*, *louse*; *mice*, *lice*. The diphthong *ou* changed to the diphthong *i* (as in *night*). The combination *ce* is used instead of *se*, for the

same reason as in *pence* and *dice*, *i. e.* lest, if written *mise*, *lise*, the words should be pronounced *mize*, *lize*.

§ 104. *Plurals formed by the addition of* -en *or* -n. —In the present English the word *oxen* is the only specimen of this form in current use. In the older stages of our language the number of words in *-en* was much greater than at present.

hos-en	=	*hose or stockings.*
shoo-n	=	*shoe-s.*
ey-ne	=	*eye-s.*
bischop-en	=	*bishop-s.*
eldr-en	=	*elder-s.*
arw-en	=	*arrow-s.*
scher-en	=	*shire-s.*
doghtr-en	=	*daughter-s.*
sustr-en	=	*sister-s.*
uncl-en	=	*uncle-s.*
tre-en	=	*tree-s.*
souldr-en	=	*soldier-s.*

§ 105. *Plurals formed by a combination, &c.*—Three words occur in this class.

1. *Kyne* = *cows*; a plural formed from a plural by the addition of *-n*; as *cow*, *kye*, *ky-ne*. *Kye* is found in provincial English, and *cý* in Anglo-Saxon.
2. *Children*; a plural formed from a plural by the addition of *-en*; as *child*, *child-er*, *child-er-en* = *children*.
3. *Brethren*; a plural formed from a plural by the addition of *-en*; as *brother*, *brether (?)*, *breth-er-en*=*brethren*.

§ 106. When the singular ends in *o*, the plural ends in *oes*; as *cargo, cargoes*. When the singular ends in *y*, preceded by a consonant, the plural ends in *-ies*; as *lady, ladies; quantity, quantities*. In *youth, oath, truth*, and *path*, the *th*, though sounded in the singular as in *thin*, is generally sounded in the plural as in *thine*.

Singular.		*Plural.*
You*th*,	pronounced	You*thz*, not You*thce*.
Oa*th*	—	Oa*thz*, — Oa*thce*, &c.

DEGREES OF ADJECTIVES.

§ 107. An Adjective shows that the Substantive with which it is united possesses a certain quality. To say that *glass is smooth, clear, brittle, and bright*, is to say that it possesses the qualities of *smoothness, clearness, brittleness*, and *brightness*.

§ 108. Qualities may be possessed in different degrees. One piece of glass may be as *bright* as another; a second may be *brighter;* and a third the *brightest* of all. Adjectives, therefore, though they have neither Gender nor Number, nor yet Case, have three Degrees of Comparison, viz.:—

1. The *Positive:* which gives the word in its simple form; as *bright:*
2. The *Comparative:* formed from the Positive by the addition of *-er;* as *bright-er:*
3. The *Superlative:* formed from the Positive by the addition of *-est;* as *bright-est.*

§ 109. The Superlative may, also, be formed from the Comparative by changing *r* into *s* and adding *t*, as dark-*er*, dark-*es*, dark-*es-t*.

This second mode of forming the Superlative appears, at first sight, to be both complex and superfluous. The following facts, however, will show that it is neither. Although it is quite true that, by adding *-est* to the Positive, a Superlative can be formed, it is by no means certain that such is the process by which it actually *was* formed.

In the oldest language of the class to which the English belongs, the Comparatives themselves ended in *z*; so that *ald-iza*, *bat-iza*, *sut-iza*, &c., are the original forms of what was afterwards *alt-iro*, *bets-iro*, and *suats-iro*, and what is now *old-er*, *bett-er*, and *sweet-er*.

Again,—whilst many languages have a Comparative without a Superlative, there is no such thing as a Superlative without a Comparative. Putting these facts together, it has been held, that, in the languages akin to the English, the Superlative is formed, not *directly* from the Positive, but *indirectly* from the Comparative—and that at a time when the latter ended in *-z*, or *-s*.

§ 110. *Good* and *bad* have no Comparative and no Superlative, *worse* and *better* no Positive, forms.

A little consideration shows the nature of the foregoing rule. The Comparatives and Superlatives of *good* and *bad*, if they existed at all, would be *gooder* and *goodest*, *badder* and *baddest*. Yet it is well known that no such words occur in the language. It is also well known that there is no such word as *bet*, of which *better* could be the Comparative.

As far, however, as *meaning* is concerned, *better* is the Comparative of *good*, and *worse* of *bad*. The *words*, however, are different, and as neither is derived from the other, nor yet from any common source, there is no etymological connection between them. Such connection as there is, is logical.

The words under notice (and there are others like them) are each defective, though defective in a different manner. What one wants the other supplies.

§ 111. In Anglo-Saxon the following words, along with some others, changed their vowels in the Comparative and Superlative degrees:—

Lang (*Long*).	Lengre (*Longer*).
Strang (*Strong*).	Strengre (*Stronger*).
Geong (*Young*).	Gyngre (*Younger*).
Sceort (*Short*).	Scyrtre (*Shorter*).
Heah (*High*).	Hyrre (*Higher*).

In the present English the words *elder* and *eldest*, from *old*, do the same.

§ 112. The words *inmost*, *outmost*, *upmost*, *midmost*, *foremost*, *hindmost*, *utmost*, are *doubly* Superlative.

§ 113. The words *nethermost*, *uppermost*, *uttermost*, *undermost*, *outermost*, and *innermost*, are not only *doubly* Superlative, but Comparative as well.

These last two statements require explanation. The common statement concerning words like *utmost* is, that they are compounds, formed by the addition of the word *most*. This, however, is more than doubtful; inasmuch as the Anglo-Saxon language presents us with the following forms:—

Innema (inn-ema)	Inmost.	Forma (for-ma)	Foremost.
Utema (ût-ema)	Outmost.	Æftema (æft-ema)	Aftermost.
Sithema (sith-ema)	Latest.	Ufema (uf-ema)	Upmost.
Lætema (læt-ema)	Latest.	Hindema (hind-ema)	Hindmost.
Nithema (nith-ema)	Nethermost.	Midema (mid-ema)	Midmost.

Besides these there are, in the other allied languages, words like *fruma* = *first*, *aftuma* = *last*, *miduma* = *middle;* in all of which the *m* that appears in the last syllable of each has nothing to do with the word *most*.

Upon this basis, however, was formed, in Anglo-Saxon, a regular superlative in the usual manner; viz., by the addition of *-st;* as *æfte-m-est*, *fyr-m-est*, *læte-m-est*, *siδ-m-est*, *yfe-m-est*, *ute-m-est*.

Hence, in the present English, the different parts of words like *upmost* come from different quarters. The *m* is the *m* in the Anglo-Saxon words *innema*, &c.; whilst the *-st* is the *st* in *brightest*, &c. Hence, in separating them into their component parts, we should write—

Ut-m-ost	*not*	Ut-most.	In-m-ost	*not*	In-most.
Up-m-ost	—	Up-most.	Hind-m-ost	—	Hind-most.
Fore-m-ost	—	Fore-most.	Out-m-ost	—	Out-most.

§ 114. At the present time, the English adjective

is wholly destitute of Inflection. In A. S. it was not only declined, but it had two declensions; one Indefinite, and one Definite. The former ran thus:—

Singular.

	Masculine.	*Feminine.*	*Neuter.*
Nominative.	Gód	Gód	Gód
Accusative.	Gódne	Góde	Gód
Ablative.	Góde	Gódre	Góde
Dative.	Gódum	Gódre	Gódum
Genitive.	Gódes	Gódre	Gódes.

Plural.

	Masculine.	*Feminine.*	*Neuter.*
Nominative.	Góde	Góde	Góde
Accusative.	Góde	Góde	Góde
Ablative.	Gódum	Gódum	Gódum
Dative.	Gódum	Gódum	Gódum
Genitive.	Gódra	Gódra	Gódra.

§ 115. The Definite Declension, which was used, when the Adjective was preceded by either the Definite article or a Demonstrative Pronoun, was characterized by the predominance of the forms in *-n*. Thus:—

Singular.

	Masculine.	*Feminine.*	*Neuter.*
Nominative.	Góde	Góda	Góde
Accusative.	Gódan	Gódan	Gódan
Ablative.	Gódan	Gódan	Gódan
Dative.	Gódan	Gódan	Gódan
Genitive.	Gódan	Gódan	Gódan.

Plural.

	Masculine.	*Feminine.*	*Neuter.*
Nominative.	Gódan	Gódan	Gódan
Accusative.	Gódan	Gódan	Gódan
Ablative.	Gódum	Gódum	Gódum
Dative.	Gódum	Gódum	Gódum
Genitive.	Gódena	Gódena	Gódena.

§ 116. The Declension of the Participle was, in the main, that of the Adjective.

Singular.

	Masculine.	*Feminine.*	*Neuter.*
Nominative.	Bærnand	Bærnand	Bærnand
Accusative.	Bærnandne	Bærnande	Bærnand
Ablative.	Bærnande.	Bærnandre	Bærnande
Dative.	Bærnandum	Bærnandre	Bærnandum
Genitive.	Bærnandes	Bærnandre	Bærnandes.

Plural.

	Masculine.	*Feminine.*	*Neuter.*
Nominative.	Bærnande	Bærnande	Bærnande
Accusative.	Bærnande	Bærnande	Bærnande
Ablative.	Bærnandum	Bærnandum	Bærnandum
Dative.	Bærnandum	Bærnandum	Bærnandum
Genitive.	Bærnandra	Bærnandra	Bærnandra.

This fulness of inflection of both the Adjective and the Participle, during the Anglo-Saxon period, contrasts with the utter absence of declension at the present moment, and may serve as an illustration of what we may call *virtual*, as opposed to *actual*, inflections. An adjective agreeing with a substantive, denoting a male, is *virtually* in the masculine gender, inasmuch as, if there were such a thing, at the present time, as the sign of gender, it would take that of the masculine. It really did this in an earlier stage of the language. The same applies to the questions of Number and Case. Adjectives agreeing with Substantives in the Plural Number, or the Possessive Case, are virtually Possessive and Plural Adjectives. The same applies to Participles.

Inflection of the Adjective in Old English.

1. In these lay a gret multitude of *syke* men, *blinde*, crokid, and *drye*.—WICLIFFE, John v.

> In all the orders foure is none that can
> So much of dalliance and faire language,
> He hadde ymade ful many a marriage—
> His tippet was ay farsed ful of knives,
> And pinnes for to given *faire* wives.
>
> CHAUCER, *Prol.*

3. And *al* the cuntre of Judee wente out to him, and *alle* men of Jerusalem.—WICLIFFE, Mark i.

4. He ghyueth lif to *alle* men, and brething, and *alle* thingis; and made of von *al* kynde of men to inhabit on *al* the face of the erthe.—WICLIFFE, Dedis of Apostlis, xvii.

5. That fadres sone which *alle* thinges wrought;
> And *all*, that wrought is with a skilful thought,
> The Gost that from the fader gan procede,
> Hath souled hem.
>
> CHAUCER, *The Second Nonnes Tale.*

6. And *alle* we that ben in this aray
And maken *all* this lamentation,
We losten *alle* our husbondes at that toun.
CHAUCER, *The Knightes Tale.*

7. A *good* man bryngeth forth *gode* thingis of *good* tresore.—WICLIFFE, Matt. vii.

8. So every *good* tree maketh *gode* fruytis, but an yvel tree maketh yvel fruytes. A *good* tree may not make yvel fruytis, neither an yvel tree may make *gode* fruytis. Every tree that maketh not *good* fruyt schal be cut down.—WICLIFFE, Matt. vii.

9. Men loveden more darknessis than light for her werkes weren *yvele*, for ech man that doeth *yvel*, hateth the light.—WICLIFFE, John iii.

VERBALS.

§ 117. Certain words, like *hunter* and *cleansing*, are called Verbal Substantives or Verbals.

§ 118. Every Verbal has its corresponding Verb. *Hunter* is formed from *hunt*, by the addition of *-er*; *cleansing* from *cleanse*, by the addition of *-ing*.

In form these Verbals are for the most part identical with the Participle; and there is no want of writers who treat them as such. *Hunting*, for instance, is made the Participle of *hunt*; *rising*, of *rise*. That the resemblance, however, is accidental, and that the two forms have no original connection, becomes clear upon a little consideration. In the first place there are such plural forms as *the risings of the north*; *the huntings of the hare*; *the watchings and wakings of an anxious man*. Secondly, the Anglo-Saxon form of the Substantive was not *-ing*, but *-ung*; whilst that of the Participle was *-nd*. The Participle of *clœnsian* = *to cleanse*, was *clœnsiand*; the equivalent to the word *cleansing* was *clœnsung*.

§ 119. The Verbals in *-ing* denote actions and results. *Hunting* is the act performed by a *hunter*; *sleeping* the deed done by one who *sleeps*.

§ 120. Instead of the Verbal we may use the Verb preceded by *to*—*Rising early is good for the health*; or, *To rise early is good for the health*.

§ 121. The Verbals in *-er* denote agents; a *hunter* being one who *hunts*, a *sleeper* one who *sleeps*.

§ 122. The Verbals in *-er* are true English words; and they must be distinguished from those in *-or*, which are derived from the Latin. Words like *baker*, *singer*, *fisher*, &c., are English, words like *actor* are Latin.

As a general rule the forms in *-or* are masculine; *i. e.* they give us the names of men rather than women. An *actor* is a *man* who *acts;* a *female* who *acts* being an *actress*.

Words in *-ess*, like words in *-or*, are of Latin origin; either directly or indirectly. The Latin termination is *-ix*, which, in French, becomes *-ice*. In Anglo-Saxon it has no existence at all; so that feminines in *-ess* match masculines in *-or*, not masculines in *-er*. The French equivalent to *-or* is *-eur:* so that *actor* becomes *acteur*.

It is true, indeed, that in some few cases we attach the syllable *-ess* to words of English origin. So accurate a writer as Ben Jonson uses the word *huntress*.

> Queen and *huntress* chaste and fair,
> Now the sun is lain to sleep,
> Seated in thy silver chair,
> State with wonted splendour keep.
> Hesperus invokes thy light,
> Goddess exquisitely bright.—CYNTHIA'S REVELS.

The word, however, is exceptionable; as are all words (though there are many of them in the language) which are made up out of two languages. Let any one write *bakor*, *singor*, *fishor*, and form from them such words as *bakress*, *singress*, *fishress*, and he will see that the combination is, to say the least of it, unfamiliar.

In *actor* and *actress* there is a change from one syllable to another. But this is not always the case. There are many masculines in which no such syllable as *-or* is to be found, and where the feminine is formed by the *addition*, rather than the *substitution*, of *-ess*. Such are—*Peer*, *Duke*, *Marquis*, for the Masculine; *Peeress*, *Duchess*, *Marchioness*, for the Feminine.

The true English form of the feminine verbal is nearly obsolete. It is, however, the syllable *-ster*. In Anglo-Saxon—

Sangere, *a male singer*,	were opposed to	Sangestre, *a female singer*.
Bæcere, *a male baker*,		Bacestre, *a female baker*.
Fiðelere, *a male fiddler*,		Fiðelstre, *a female fiddler*.
Webbere, *a male weaver*,		Webbestre, *a female weaver*.
Rædere, *a male reader*,		Rædestre, *a female reader*.
Seamere, *a male seamer*,		Seamestre, *a female seamer*.

In the Dutch *waschter* means *washerwoman*. In English, however, the only true representative of the old form is the word *spinster*, meaning a *female who spins*. The opposite to this is *spinner*. As to the words *Baxter*, *Webster*, and *Brewster*, they are now known only as proper names. Originally, however, they meant a *female baker*, a *female weaver*, and a *female brewer*.

ABSTRACTION AS CONNECTED WITH THE VERB.

Abstraction, important in both the Etymology and Syntax of the Noun, is, also, important in the Etymology and Syntax of the Verb. It is of high import in all grammars; but especially in that of the English language. In English we have such lines as

To err is human, *to forgive* divine—
To be or not to be, that is the question—

in which a Substantive in the Nominative Case is represented by a Verb with a Preposition before it. *To err* means *error* and *to forgive* means *forgiveness*. How is this? Let us see how far the idea of abstraction helps us to an answer; and let us take the Adjective first.

Two objects such as a ribbon and an orange are yellow. I have a clear notion of both. But suppose that I wish to consider the quality common to the two. It is manifest that I must separate, or draw it off from the roundness, the fragrance, and the other qualities of the fruit, as well as from the texture, the pattern, and the other qualities of the ribbon. I must take it by itself. I must get the idea of yellowness, independent of the particular objects to which it may be attached.

And so I act with the Verbal. A horse may *run*, or a man may *run*. The horse may *run* to-day, the man may have *run* yesterday; but if I wish to have the notion of the act of *running*, I must separate, or *draw it* off, from both the horses and the men who perform it, as well as from the time at which it was performed.

In both these cases the result is something which I can imagine, but which I cannot perceive through any of my senses. I can see a *man* in a *state of happiness* and I can see a *horse* in the *act of running*. *Happiness*, however without some happy object, or *the act of running*, without some object that runs, I cannot perceive, though I can imagine it.

Both, however, are Substantives; one being the name of a quality, the other that of an action.

For the present this is nearly all that need be said. We are passing from one of the chief parts of speech to another, from the

Pronoun, the Substantive, and the Adjective, to the Verb and Participle. Which class is the most important it is difficult to say. The Verb, by many grammarians, is looked upon as the primary part of speech, and from this view it derives its name. The Latin *verbum* means *word*, and the Verb has been held to be pre-eminently *the word* in language. Whether this doctrine be right or wrong need not now be asked. The object of the present remarks is to show that the difference between the two great classes is by no means very great; and in order to do this, an apparent deviation from the right line of investigation has been resorted to. The Verbal is evidently derived from the Verb; and the Verb is the basis of the Verbal. Yet the Verbal, though a secondary and derived form, has been taken first. By thus taking it, we show more clearly the connection between the Verb and the Substantive.

VERBS.

§ 123. Certain Verbs are made Transitive by changing the vowel; as, *risė, raise = make to rise.*

In Anglo-Saxon, these pairs of words were much more numerous than they are at present. There were, for instance, in Anglo-Saxon—

Intransitive.		*Transitive.*	
Yrnan,	*to run.*	Ærnan,	*to make to run.*
Byrnan,	*to burn.*	Bærnan,	*to make to burn.*
Drincan,	*to drink.*	Drencan,	*to drench.*
Sincan,	*to sink.*	Sencan,	*to make to sink.*
Licgan,	*to lie.*	Lecgan,	*to lay.*
Sittan,	*to sit.*	Settan,	*to set.*
Drífan,	*to drift.*	Dræfan,	*to drive.*
Feallan,	*to fall.*	Fyllan,	*to fell.*
Weallan,	*to boil.*	Wyllan,	*to make to boil.*
Fleogan,	*to fly.*	A-fligan,	*to put to flight.*
Beogan,	*to bow.*	Bígan,	*to bend.*
Faran,	*to go.*	Feran,	*to convey.*
Wacan,	*to wake.*	Weccan,	*to awaken.*

§ 124. In respect to their inflection, Verbs are (1) related to the Substantive, (2) related to the Adjective, and (3) characterized by peculiarities of their own.

§ 125. So far as the Verb is related to either the Substantive or the Adjective it is Declined. So far as it is characterized by peculiarities of its own it is Conjugated.

DECLENSION OF VERBS—SUBSTANTIVAL.

§ 126. So far as a Verb is declined as a Substantive it is either an Infinitive or a Gerund.

§ 127. In Anglo-Saxon there was a true Infinitive Mood which ended in *-an*, as *bærnan* = *burn*, *lufian* = *love*. When this was preceded by *to*, *-an* became *-enne*; as *to lufienne* = *to love*, *to bærnenne* = *to burn*.

That this form in *-enne* was distinct from the one in *-an* is so clear that it would be a waste of time to enlarge on the fact of its being so. It is more important to state that a difference of construction closely agreed with this difference of form, and that traces of it are to be found even at the present moment.

A well-known rule tells us that the latter of two verbs is in the Infinitive Mood, and that the sign of the Infinitive Mood is the preposition *to*. This is illustrated by such phrases as the following:—*I wish to speak; thou meanest to go; he prepares to fight.*

But besides such combinations as these, there is a second series, wherein no such word as *to* is to be found. The words *can*, *may*, *shall*, *will*, and a few others are just as much verbs as *wish*, *mean*, or *prepare;* yet their construction is different. No one says *I can to speak*, or *I may to go;* but, on the contrary, *I may go*, or *I can speak*. The explanation of this lies in the original difference between the forms in *-an* and *-enne*. After *can*, *may*, &c., the former, after the other verbs the latter, was used.

If two words differ from each other in their endings only, and those endings be lost, the difference will be abolished. From bærn *-an* take *-an*, from bærn-*enne* take *-enne*, and the result is bærn. From *bærn-an*, however, comes the *burn* in *I can burn;* and from *bærn-enne* the *burn* in *I begin to burn*.

Of these two forms, the one in *-n* corresponds with the Latin Infinitive, so that *bærnan* = *urere;* the one in *-nne*, on the other hand, corresponds with the Gerund; so that *to bærnenne* = *ad urendum*.

DECLENSION OF VERBS—ADJECTIVAL. PARTICIPLE.

§ 128. So far as a Verb is declined as an Adjective it is a Participle.

§ 129. The Participles in English are two; the Present and the Past.

§ 130. The Present always ends in *-ing*, as com-*ing*, plant-*ing*, writ-*ing*.

§ 131. The Past varies in form, which is *generally* regulated by that of the Past Tense.

§ 132. When the Preterite Tense ends in *-ed*, or *-t*, the Participle, *for the most part*, does the same, as *I called, I have called.*

This identity, however, is accidental. The Anglo-Saxon form of the Preterite was *-ode*, *-de*, or *-te*, as *lufode*, *bærnde*, *dypte* = *loved*, *burnt*, *dipped*. Meanwhile the Participle ended in *-ed* or *-t*, as *-lufod*, *-bærned*, *-dypt*.

§ 133. When the Preterite is formed by changing the vowel, the Participle, *for the most part*, ends in *-n*.

Present.	*Preterite.*	*Participle.*	*Present.*	*Preterite.*	*Participle.*
Fall	Fell	Fallen	Shear	Shore	Shorn
Hold	Held	Holden	Wear	Wore	Worn
Draw	Drew	Drawn	Break	Broke	Broken
Shew	Shewed	Shewn	Shake	Shook	Shaken
Slay	Slew	Slain	Take	Took	Taken
Fly	Flew	Flown	Get	Got	Gotten
Blow	Blew	Blown	Eat	Ate	Eaten
Crow	Crew	Crown	Tread	Trod	Trodden
Know	Knew	Known	Bid	Bade	Bidden
Grow	Grew	Grown	Forbid	Forbade	Forbidden
Throw	Threw	Thrown	Give	Gave	Given
Beat	Beat	Beaten	Arise	Arose	Arisen
Weave	Wove	Woven	Smite	Smote	Smitten
Freeze	Froze	Frozen	Ride	Rode	Ridden
Steal	Stole	Stolen	Stride	Strode	Stridden
Speak	Spoke	Spoken	Drive	Drove	Driven
Swear	Swore	Sworn	Thrive	Throve	Thriven
Bear	Bore	Borne	Strive	Strove	Striven
Bear	Bare	Born	Write	Wrote	Written
Tear	Tore	Torn	Bite	Bit	Bitten.

1. The verbs *engrave*, *hew*, *lade*, *mow*, *sow*, *shave*, *shew*, *strew*, and some others, form their preterites in *-d*, as *engraved*, *hewed*, *laded*, *mowed*, &c. Nevertheless, their participles end in *-n*, as *engraven*, *hewn*, *laden*, *mown*, *sown*, *shaven*, *shewn*, *strewn*.

2. Several words, which in Anglo-Saxon ended in *-en*, have, in the present stage of the language, dropped that ending.

Come, Shone, Swum, Run, &c., } were in Anglo-Saxon { *Ge*-cum*en*, *Ge*-scin*en*, *Ge*-swumm*en*, *Ge*- runn*en*, &c.

From *drunk* and *sink* we may form either *drunk* or *drunken*, *sunk* or *sunken*. No one, however, says *I have sungen a song*, but, rather *I have sung one.*

The prefix *ge-* deserves notice. In Anglo-Saxon it was as necessary a part of the past participle as the terminations *-d*, or *-n*; and so it is in German at the present moment. The German says—

Ich habe *ge*sagt = I have said.
Ich habe *ge*sehen = I have seen, &c.

In modern English, however, it is obsolete. At the same time, it occurs in a word, which, though only found in such writings of the present century as affect an antiquated form, occurs in a poem so well known as the Allegro of Milton—

But hail thou, goddess, fair and free,
In heaven *ycleped* Euphrosyne;
But by men heart-easing mirth, &c.

It means *called;* and was in Anglo-Saxon, *geclepod*, from *clepian = to call.*

The words like *engraven*, *mown*, &c., were quoted, in order to show that a participle in *-n* was compatible with a preterite in *-d*. It must not, however, be supposed that they exclude the ordinary form. Concurrently with—

Engraven, Mown, Shewn, &c., } we have { Engraved, Mowed, Shewed.

§ 134. In Anglo-Saxon, there were a few words which changed *s* into *r* in the Participle.

Ceóse, *I choose;* ceâs, *I chose;* curon, *we chose;* gecoren, *chosen.*
Forleóse, *I lose;* forleás, *I lost;* forluron, *we lost;* forloren, *lost.*
Hreose, *I rush;* hreás, *I rushed;* hruron, *we rushed;* gehroren, *rushed.*

This accounts for the Participial form *forlorn* or *lost.*
In Milton's lines,

——————————— the piercing air
Burns *frôre*, and cold performs the effect of fire.
Paradise Lost, b. ii.,

we have a form from the Anglo-Saxon *gefroren = frozen.*

§ 135. In respect to their tenses, the Verbs fall into two divisions. In the first the Past Tense is formed by changing the vowel, as *speak*, *spoke*. In the second it is formed by adding the sound of *-ed*, *-d*, or *-t*, as *plant-ed*, *move-d*, *wep-t*.

In the following list, all the verbs belong to the first division. They have, however, *two* forms of the Past Tense: one of which, is, in some words (*i.e.* those marked by the asterisk), obsolete.

Present.	*Past.*	
rise	rose	*ris
smite	smote	smit
ride	rode	*rid
stride	strode	strid
slide	*slode	slid
chide	*chode	chid
drive	drove	*driv
thrive	throve	*thriv
write	wrote	writ
slit	*slat	slit
bite	*bat	bit
swim	swam	swum
begin	began	begun
spin	span	spun
sing	sang	sung
spring	sprang	sprung
sting	*stang	stung
ring	rang	rung
wring	*wrang	wrung
fling	*flang	flung
cling	*clang	clung
string	*strang	strung
sling	slang	slung
sink	sank	sunk
drink	drank	drunk
shrink	shrank	shrunk
stick	*stack	stuck
burst	*barst	burst
bind	*band	bound
find	*fand	found
grind	*grand	ground
wind	*wand	wound

For *barst* we occasionally find *brast*. The forms like *fand* are chiefly Scotch.

§ 136. In A. S., many words which now form their past tense in *-ed*, *-d*, or *-t*, formed it by the change of vowel.

Present.	*Existing Past.*	*A. S. Past.*
Wreak	Wreaked	Wræ'c.
Fret	Fretted	Fræ't.
Mete	Meted	Mæ't.
Shear	Sheared	Scear.
Braid	Braided	Bræ'd.
Knead	Kneaded	Cnæ'd.
Dread	Dreaded	Dred.
Sleep	Slept	Slep.
Fold	Folded	Feold.
Wield	Wielded	Weold.
Wax	Waxed	Weox.
Leap	Leapt	Hleop.
Sweep	Swept	Sweop.
Weep	Wept	Weop.
Sow	Sowed	Seow.
Bake	Baked	Bók.
Gnaw	Gnawed	Gnóh.
Laugh	Laughed	Hlóh.
Wade	Waded	Wód.
Lade	Laded	Hlóh.
Grave	Graved	Gróf.
Shave	Shaved	Scof.
Step	Stepped	Stóp.
Wash	Washed	Wócs.
Bellow	Bellowed	Bealh.
Swallow	Swallowed	Swealh.
Mourn	Mourned	Mearn.
Spurn	Spurned	Spearn.
Carve	Carved	Cearf.
Starve	Starved	Stærf
Thresh	Threshed	Thærsc.
Hew	Hewed	Heow.
Flow	Flowed	Fleow.
Row	Rowed	Reow.
Creep	Crept	Creáp.
Dive	Dived	Deáf.
Shove	Shoved	Sceáf.
Chew	Chewed	Ceáw.
Brew	Brewed	Breáw.
Lock	Locked	Leác.
Suck	Sucked	Seác.

Present.	*Existing Past.*	*A. S. Past.*
Reek	Reeked	Reác.
Smoke	Smoked	Smeác.
Bow	Bowed	Beáh.
Lie	Lied	Leáh.
Gripe	Griped	Gráp.
Span	Spanned	Spén.
Eke	Eked	Eóc.
Fare	Fared	Fôr.

§ 137. In the Verbs of the first division, the Past Tense was originally Reduplicate.

In the Mœsogothic, these preterites fell into twelve classes, of which the first two give *salta* and *saisal*, *háita* and *háiháit*.

In the next four the reduplication continues, *but the vowel is changed as well.*

In the last six the vowel is changed, *but the reduplication ceases.*

	Present.	*Preterite.*	*English.*		
Simple reduplication.	1. Salta	Sái-salt	*Leap*	and	*Leaped.*
	2. Háita	Hái-háit	*Hight*	„	*Hight.*
Reduplication, and change of vowel.	3. Stáuta	Stái-stáut	*Strike*	„	*Struck.*
	4. Slêpa	Sái-zlêp	*Sleep*	„	*Slept.*
	5. Láia	Taito	*Laugh*	„	*Laughed.*
	6. Grêta	Gáigrôt	*Weep*	„	*Wept.*
Change of vowel only.	7. Svara	Svôr	*Swear*	„	*Swore.*
	8. Greipa	Gráip	*Gripe*	„	*Griped.*
	9. Buida	Báup	*Bid*	„	*Bade.*
	10. Giba	Gab	*Give*	„	*Gave.*
	11. Stila	Stal	*Steal*	„	*Stole.*
	12. Rinna	Rann	*Run*	„	*Ran.*

In Anglo-Saxon, though the reduplication is lost, the classification is essentially the same as the Mœsogothic.

Present.	*Preterite.*	*English.*		
1. Fealle	Feol	*Fall*	and	*Fell.*
2. Swape	Sweop	*Sweep*	„	*Swept.*
3. Hleape	Hleop	*Leap*	„	*Leapt.*
4. Slepe	Slep	*Sleep*	„	*Slept.*
5. Blawe	Bleow	*Blow*	„	*Blew.*
6. ——	——	——	—	——
7. Fare	For	*Fare*	„	*Fared.*
8. Bide	Bad	*Bide*	„	*Bode.*
9. Creope	Creap	*Creep*	„	*Crept.*
10. Swefe	Swæf	*Slumber*	„	*Slumbered.*
11. Nima	Nam*	*Take*	„	*Took.*
12. Helpe	Healp	*Help*	„	*Helped.*

A great many of these obsolete preterites are still to be found by those who know where to seek them, viz. amongst the provincial

* This word was in use in Shakespeare's time, and signifies *take.*

dialects of Great Britain, where they are stigmatized as vulgarisms, though they belong to the language as it was spoken by the venerable Bede and written by the learned Alfred.

Let us remember that in both the Latin and the Greek there are not only two forms for the preterite tense, but two meanings also. Where *we* use a circumlocution, and combine the participle with the verb *have*, the Greeks availed themselves of an inflection, and expressed such a phrase as *I have written* by the single word *gegrafa*. Meanwhile, *egrapsa* stood for *I wrote*. The effect of this was to give the language two tenses; both tenses of past time, though not exactly expressive of the same idea.

2. The same was the case in Latin, except that though both forms were to be found in the language, they were seldom, if ever, to be found in the same word. As a consequence of this their meaning was uncertain. *Cucurri*, a preterite of *curro*, meant either *I ran* or *I have run*. Meanwhile, no such word as *cursi* is known. On the other hand, *rexi* (*reg-si*), from *rego* = *I rule*, meant either *I have ruled* or *I ruled*—no such form as *re-regi* existing. From facts like these the Latin language is considered to have but one preterite tense, though it is clear that, originally, there were two.

3. It is reasonably believed that the same is the case in the English and the languages allied to it; in all of which the forms like *did*, *spoke*, and *swum* coincide with the forms like *cucurri* and *gegrafa*, whilst those in *-d* or *-t* coincide with *egrapsa* and *rexi*. The exact details are, indeed, different. The principle, however, is the same. Two tenses, originally distinct, coalesce into one—some verbs keeping to one form, some to the other.

The preceding rules are sufficient to give a general idea of the principles upon which the Past Tense and the Past Participle are formed. There are, however, several details which still stand over for notice. The Preterite, even in its simplest form, is by no means invariable. That it sometimes ends in *-ed*, sometimes in *-d*, and sometimes in *-t* has already been stated. We have not, however, said under what circumstances these several endings are used.

In respect to *-ed* we sometimes sound it in *all* words, viz. when we declaim or utter words of special solemnity. In reading the actual text of the Scriptures we say *bless-ed:* only, however, in the actual text. In the *version* of the Psalms we make the word a monosyllable, *e.g.*

How *blessed* is he who ne'er consents.

In ordinary conversation and reading *-ed* is only sounded when the original word ends in *-d* or *-t*, as *instruct*, *slight*, where we say *instructed* and *slighted*, because *instrucktt* and *slightt* would be unpronounceable.

T is added when the original word ends in *-p*, *-k*, *-s*, or *-sh*; as *dip*, *pluck*, *toss*, *push*. Here, although we write

Dipped, Plucked, Tossed, Pushed, } we pronounce the words { Dipt. Pluckt. Tosst. Pusht.

In most other cases the addition is the simple sound of *-d*—*serve*, *served*; *cry*, *cried*; *fill*, *filled*; *stab*, *stabbed*, &c.; wherein the Present and Preterite have the same number of syllables. This would not be the case if *-ed* were actually added. All such words as *whizzed*, *stabbed*, *judged*, *filled*, &c., though dissyllables to the eye, are monosyllables to the ear.

Such are the changes which affect the *end* of the word. In many cases, however, the middle parts are changed and the vowel of the root is altered.

Sometimes it is simply shortened, as *leave*, *left*; *creep*, *crept*; *flee*, *fled*.

Sometimes it is actually changed, as *tell*, *told*; *sell*, *sold*.

Sometimes there is a change of the *consonant*. The most remarkable words in this respect are the following:—

1. *Bought*, from *buy*. The Anglo-Saxon was *bycgan* and *bohte*.
2. *Sought*, from *seek*. The Anglo-Saxon was *secan* and *sohte*.
3. *Beseech* is a compound of *seek*. Hence its preterite is *besought*.
4. *Taught*, from *teach*. Anglo-Saxon, *tæcan* and *tohte*.
5. *Caught*, from *catch*. Anglo-Saxon, *cacan*, *cahte*.
6. *Brought*, from *bring*. Anglo-Saxon, *bringan* and *brohte*.
5. *Thought*, from *think*. Anglo-Saxon, *thencan* and *thohte*.
8. *Wrought*, from *work*. Here there is a transposition as well as a change. The Anglo-Saxon was *wyrcan* and *wrohte*.

It is not difficult to discover the reason for these apparent irregularities. All the words of the preceding list contain the sound of either *g* (as in *go*), or its ally *k* (or *c*); sounds which have a great tendency to change. They pass into *h*, into *y*, into *tsh*, and into *dzh*. The details, however, of these changes belong to the province of the general grammarian.

§ 138. *Made*, *had*, and *laid* are contractions. The older forms were *macode*, *hæfde*, and *legde*.

The confusion between *lie* and *lay* is so common, and, at the same time, so blameworthy, that it is advisable to notice it. To *lie* is a verb neuter or intransitive, the preterite of which is *lay*. To *lay* is a verb transitive, the preterite of which is *laid*. In meaning the words are as different as *sit* and *set*, one meaning simply to *lie down*, the other to *cause to lie down*. We may say either *I lie down to sleep*, or *I lay myself down*, in the Present

Tense. We may also, in the Preterite say *I lay down* or *laid myself down.* We cannot, however, say *I mean to lay down*, nor yet *I mean to lie myself down.*

The proper Participle of *lie* is *lien.* It is, however, nearly replaced by the newer form *lain.*

§ 139. *Dare* is both Intransitive and Transitive. We can say *I dared to fight* and *I dared* (or *challenged*) *him to fight.*

§ 140. *Durst* is Intransitive only. It never means *challenge.* It can, however, be used both as a Present and as a Preterite. We can say, *I durst not do so now*, and *I durst not so when you spoke to me.*

§ 141. *He owned to having done it* means, *he admitted, conceded,* or *granted that he had done it.* When *own* has this sense it is a different word from the *own* which signifies *possess*, and comes from the Anglo-Saxon *an*, meaning *I have granted*, of which the plural is *unnon.*

§ 142. *Own* meaning *possess* is a different word from *own* meaning to *grant.* It comes from *owe*, and until after the reign of Elizabeth was destitute of the *-n.*

> See where he comes ; nor poppy nor mandragora,
> Nor all the drowsy syrups of the world,
> Shall ever med'cine thee to that sweet sleep
> Which thou *owed'st* yesterday.—*Othello.*

§ 143. *Owe*, the older form of *own*, meaning *possess*, comes from the Anglo-Saxon *ah*, meaning *I have acquired*, of which the plural is *ágon.*

§ 144. The Anglo-Saxon Preterite of *sceal* was *sculde ;* so that the *l* in *should*, though not pronounced, belongs to the word. The same is the case with *would* from *will.*

Here we may remark that the second person singular of *shall* ends in *-t*, as *shalt*. So does the second person singular of *am*, *was*, *were*, and *will*, which are *art*, *wast*, *wert*, and *wilt*.

§ 145. The Anglo-Saxon Preterite of *can* was *cuðe*, in Old English *coud*. The *l* of the present language is not sounded, and ought not to be written. It is inserted after the false analogy suggested by the words *would* and *should*.

§ 146. The Anglo-Saxon form of *may* was *mag*, of which the plural was *mugon*. Hence the *-g-* in *might*.

§ 147. *That dress becomes you* means *that dress suits you*. When *become* has this sense it is a different word from the *become* in such phrases as *the weather became colder*. It comes from the Anglo-Saxon *becweman*, of which the preterite was *becwemede*, and corresponds with the German *bequem*=*convenient*.

§ 148. *Become* in such phrases as *the weather became colder* is a different word from *become* meaning *to suit*. It comes from the Anglo-Saxon *becomman*, of which the preterite was *becam*.

§ 149. *This will do* means *this will answer the purpose*. When *do* has this sense it is a different word from the *do* which signifies *to act*. It comes from the Anglo-Saxon *deáh*, of which the preterite was *dohte*, and corresponds with the word *taugen* in German and *duge* in Danish. In its present form it has lost a *-g*.

§ 150. *Do* meaning *to act* is a different word from *do* meaning *to answer the purpose*. It comes from the Anglo-Saxon *dó*, of which the preterite is *dyde*, and corresponds with the German *thun*.

§ 151. In *did* it is the first *d* which is the sign of the tense; the second the consonant of the original verb.

§ 152. Certain words have two forms for the Preterite, one in *a*, another in *u*. When this is the case, the Participle agrees with the latter. We cannot correctly say *I have swam, I have began, I have ran*, though many are in the habit of so doing.

Present.	*1st Preterite.*	*2nd Preterite.*	*Participle.*
Swim	Swam	Swum	Swum
Begin	Began	Begun	Begun
Sing	Sang	Sung	Sung
Sink	Sank	Sunk	Sunk
Drink	Drank	Drunk	Drunk
Run	Ran	Run	Run

If we ask how this double form originated, we shall find our answer in the Anglo-Saxon, where words like *sing, swim*, &c., changed *i* into *a*, and became *sang* and *swam*. However, in the *second* person Singular, and in *all* the persons of the Plural, a second change took place, and *a* became *u*.

Singular.		*Plural.*	
Ic sang	*I sang*	We sungon	*we sung*
þu sunge	*thou sungest*	Ge sungon	*ge sung*
He sang	*he sang*	Hi sungon	*they sung.*

This shows that in such a form as *thou sangest* a double departure from the old practice has taken place. The *a* is the vowel of the first and third persons, whilst the *-st* is borrowed from the second person singular of the Present.

There are other words where this double form prevails, and where it is explained on the same principle.

The Preterites of *smite* are *smote* and *smit*. In Anglo-Saxon, *smát* was the singular, *smiton* the plural, form. Similarly—

Ic bat	*I bit*	biton	*we bit*
Ic scean	*I shone*	we scinon	*we shone*
Ic arás	*I arose*	we arison	*we arose.*

§ 153. *Be* takes three forms—*be*, *being*, and *been*. The form *be-est*, used by Milton, is obsolete.

§ 154. *Be* is only used in Commands, in Conditional Propositions, and in the Infinitive Mood; as, *be gone; if it be so; I wonder how it can be; I wish to be alone.*

§ 155. *Being* is the Present, *been* the Past Participle; *whilst one was being planted, the other was being cut down*; *I have been at work.*

§ 156. *Am* takes four forms; as, *I am, thou art, N.* or *M. is, we, ye, they are.*

§ 157. The *-m* in *a-m* is no part of the original word, but the sign of the first person. *Am* is the only word that has such a sign.

§ 158. The *t* in *ar-t*, as a sign of the second person singular, is found in three other words, *wast* (and *wert*), *shalt*, and *wilt*.

The evidence that *is* is connected with *am*, *art*, and *are* can only be got through the allied languages.

Sanskrit	Asmi	Asi	Asti
Lithuanic	Esmi	Essi	Esti
Slavonic	Yesmi	Yesi	Yesty
Latin	Sum	Es	Est
Mœso-Gothic	Im	Ist	Ist
Anglo-Saxon	Eom	Art	Is

§ 159. *Was* is found in two moods, the Indicative and the Subjunctive.

Indicative.

I was — *We were*
Thou wast — *Ye were*
He was — *They were.*

Subjunctive.

If I were — *If we were*
If thou wert — *If ye were*
If he were — *If they were.*

It is usual to call the verb *be* irregular, and to conjugate *am* and *was* as if they belonged to it. That this is incorrect is plain,

inasmuch as there is no etymological connection between the three words. They are separate verbs, expressive of a similar idea. Each is defective in some part of its conjugation; whilst the parts which are wanting in one are made by the forms of the other two. There is no Preterite to *be* and *am*, no Present to *was*.

In *was* and *were* observe the change from *s* to *r*.

Adverbs.

§ 160. Adjectives can be converted into Adverbs by adding *-ly*, as *sweet, sweetly; brave, bravely*. In such words, *-ly* is an abbreviation of *like*.

§ 161. *Else, unawares, eftsoons*, and *needs*, are Adverbs that have arisen out of Possessive Cases. So have *once, twice*, and *thrice*.

Eftsoons means *soon after*, and is a compound of *soon* and *eft* = *after*. It is used by the older writers, and such moderns as imitate them.

In such a sentence as *he needs must come when called*, the word *needs* means *of necessity*.

The older forms of *once, twice, thrice*, are *ones, twies, thries*, wherein the *s* is as truly the sign of a Possessive Case as the *-s* in *father's* or *mother's*. *Hence, whence*, and *thence*, are in a similar predicament. The *-ce* represents an original *-es;* the older forms being *hennes, whennes*, and *thennes*.

§ 162. *Seldom*, along with the obsolete word *whilom*, is an Adverb that has grown out of a Dative Case, which, in many Anglo-Saxon words, ended in *-um*.

Hvile in Danish means *rest* or *pause*. In English *meanwhile* means *in the mean time*. In like manner *while* and *whilst* mean *during the time that*. An allied meaning is preserved in the expression *to while* (*pass*) *away the time*.

§ 163. *Darkling* means *in the dark*, and is one of the few Adverbs now remaining which end in *-ling*.

In Scotch these forms are more numerous. In Scotch, for instance, *blindlins* means *blindfold; stowlins, clandestinely; sidelins, obliquely*, &c.

§ 164. *Here*, *there*, and *where* were originally the Dative Cases of the Singular Number and the Feminine Gender.

§ 165. *Then* and *when* were originally the Accusative Cases of the Singular Number and the Masculine Gender.

§ 166. *Why* was originally an Instrumental Case.

The Nominative Cases of these words were *he*, *this*, and *who*; so that

Here meant *in this place.*
There ,, *in that place.*
Where ,, *in which place.*
Then ,, *at that time.*
When ,, *at what time?*
Why ,, *for what reason?*
**The* ,, *by so much.*

It is clear that *hither*, *thither*, and *whither*, are derived from the same roots.

How can be shown to be an allied form of *why*, which meant *in what manner—for what reason?* The English language, however, conceals the likeness; whilst the Danish and Swedish, where we find the forms *hvi* and *hu*, show it more clearly.

§ 167. The only inflection which Adverbs take is that which expresses the Degrees of Comparison: which are those of the Adjective—*soon*, *sooner*, *soonest*; *often*, *often-er*, *often-est*.

There are not many words which do this. We *hear*, indeed, sometimes such expressions as *tightlier*, *quicklier*, *backwarder*, and *tightliest*, *quickliest*, *backwardest*, &c. We rarely, however, find them in writing.

§ 168. *Rather* is the comparative of *rath*, meaning *quick*, *early*, *ready*, *willing*. *I would rather do so and so* means, *I would more quickly*, *or sooner*, *do*, *&c.*

Rathe, though obsolete, is still to be found in poetry. The *rathe primrose* means *the early primrose*. In this case the *a* is sounded as in *fate*. In *rather*, however, the *a* is sounded as in

* As in *all the more*. See p. 61.

father. Why is this? In order to see this we must go back to the Anglo-Saxon.

The Anglo-Saxon differed from the present English in having two distinct inflections for the degrees of Adjectives and Adverbs. The Adjectives ended in *-re*, and *-est*, as *heard*, *heardre*, *heardest* = *hard*, *harder*, and *hardest*. Meanwhile, the Adverbial forms were *-or* and *-ost*; as *heardor*, *heardost* = *hardlier* and *hardliest*.

But this was not all. The vowel *o*, as compared with *e*, is what is called Broad; *e* being Slender. In like manner, the *a* in *father* is also Broad; the *a* in *fate* Slender. In the present English this difference in the Breadth or Slenderness of the vowels is of little importance; of less importance than it is in almost any language on the face of the earth. Elsewhere, however, it commands a great deal of attention. Elsewhere there is a very decided tendency to accommodate the vowel of root to those of the inflection, or *vice versâ*; a tendency which would change the *a* in *fate* to the *a* in *father* whenever such a termination as *-or* or *-ost* became attached.

In Anglo-Saxon this was actually the case. The word *rathe* had two series of degrees.

1. The Adjectival, as *rathe*, *rathre*, and *ratheste*; where the *a* was sounded Slender, and

2. The Adverbial, which ran *rathe*, *rather*, *rathost*, where the *a* was Broad, *i.e.* sounded as in *father*.

§ 169. Certain Adjectives may be used as Adverbs. *The sun shines bright; the time flies fast; the snail moves slow.*

These are expressions to which many grammarians object. Doubtless, it is better to say *brightly* and *slowly*. There is one class of words, however, where we have no choice, viz. the Adjectives in *-ly*. We cannot well derive *dailily* from *daily*. There exist, however, such phrases as *he labours daily; he sleeps nightly; he watches hourly*, and others; in all of which the simple Adjective is used as an Adverb. *Virtually*, this Adjective is in the Neuter Gender.*

§ 170. Prepositions, Conjunctions, and Interjections, being wholly destitute of Inflection, will be noticed more fully in the Syntax.

After the notice of Declension and Conjugation, comes that of Derivation and Composition.

* See p. 71.

Derivation.

Addition of a vowel. *Babe, bab-y.* In Lowland Scotch this is far more common, and is spelt *-ie;* as *dogg-ie, lass-ie, ladd-ie, mous-ie, wif-ie.*

Addition of L.—1. Substantives.—*Gird-le, kern-el.*

2. Adjectives.—*Litt-le, mick-le.*

3. Verbs.—*Spark-le.*

Addition of R.—Substantives.—*a.* Words that in A. S. ended in *-er*, and were of the masculine gender—*laugh-t-er, slaugh-t-er.*

b. Words that in A. S. ended in *-er*, and were of the neuter gender—*lay-er, fodd-er.*

c. Words that in A. S. ended in *ere*, and were of the masculine gender. These are almost all the names of agents—*Read-er, sinn-er, harp-er, full-er, bak-er, brew-er, thatch-er, weav-er, spinn-er, wait-er, eat-er, drink-er,* &c.

d. Words that in A. S. ended in *-ra*, and were masculine—*gander* (A. S. *gandra*).

Verbs.—*Hind-er, low-er.*

Addition of N.—Substantives.—*Maid-en, main* (as in *might and main*). That the *-n* is no part of the original word in *mai-n*, we see from the word *may*. The idea in both *may* and *mai-n* is that of *power*. Words of this sort express the fact of the object to which they are applied being *made of the material of which* the radical part of the derivative is the name: thus, *gold-en* is a derivative from *gold*, the material of which *golden guineas* are made. —So, also, *oak-en, ash-en, beech-en, braz-en, flax-en, lead-en, silk-en, wood-en, wooll-en, hemp-en, wheat-en, oat-en, wax-en.*

Addition of the sound of O, originating in *-ow* or *-ov*, and spelt in the present English *-ow*. By comparison with *shade* and *mead*, the forms *shad-ow* and *mead-ow* are shown to be derivative.

Addition of T.—1. Substantives.—*a.* Words which in A. S. ended in *-t, gif-t, shrif-t, thef-t, wef-t* (*weave*), *rif-t, drif-t, thrif-t, fros-t* (*freeze*), *grist* (*grind*), *fligh-t, sigh-t, draugh-t* (*draw*), *weigh-t.*

b. Words which in A. S. ended in *-ta.* The compounds of the word *wright* (from the root *work*, in the old past tense *wrought*); such as *cart-wrigh-t, wheel-wrigh-t, mill-wrigh-t,* &c.

2. Adjectives.—*Tigh-t* (*tie*).

Addition of D.—1. Substantives.—*Bran-d* (*burn, brenn*, obsolete), *floo-d* (*flow*), *mai-d* (*may* in Lowland Scotch), *see-d* (*sow*), *bur-d-en* (*bear*).

2. Adjectives.—*Col-d* (*cool*).

Addition of TH (A. S. þ as sounded in *thin*).—1. Substantives. —*Dea-th, bir-th* (*bear*), *heal-th, leng-th, bread-th, heigh-th, dep-th,*

mir-th, *tru-th*, *weal-th*, *fil-th*, *til-th* (*tillage, or tilled ground*), *ki-th* (as in the phrase *kith and kin*).

2. Adjectives.—The syllable *-cou-th* in the compound word *un-cou-th*. This word originally means *unknown*, originating in the word *ken* = to *know*.

Addition of TH (A. S. ð) as sounded in *thine*.—1. *Bur-th-en* derived from *bear*.

Addition of the sound of the Z in *zeal* and the S in *flags* (*flagz*).—Verbs.—*Clean-se* (*clenz*), from *clean*. In A. S. *clæn-s-i-an*.

Addition of the sound of K.—*Hill-ock*.

Addition of the sound of the vowel E (as in *feet*), originating in *-ig*, and spelt in the present English *-y*.—All the derivative adjectives that now end in *-y*, ended in A. S. in *-ig*; as *blood-y*, *craft-y*, *drear-y*, *might-y*, *mist-y*, *mood-y*, *merr-y*, *worth-y*, of which the A. S. forms were *blôd-ig*, *cræft-ig*, *dreôr-ig*, *miht-ig*, *mist-ig*, *môd-ig*, *myr-ig*, *worth-ig*.

Addition of the syllable *-ing*.—*Clean-s-ing*, *dawn-ing*, *morn-ing*. In these words the *-ing* was originally *-ung*; as *clæn-s-ung*, *dag-ung*, A. S.

Addition of the syllable *-l-ing*.—*Gos-l-ing* (*little goose*), *duck-l-ing* (*little duck*), *darl-ing* (*little dear*), *hire-l-ing*, *found-l-ing*, *fond-l-ing*, *nest-l-ing*, &c. The words of this class are generally diminutives, or words expressive of smallness.

Addition of the syllable *-kin*.—*Lamb-kin* (*little lamb*), *mann-i-kin* (*little man*). Words ending in *-kin* are chiefly diminutives.

Addition of the syllable *-rel*.—*Cockerel* (*little cock*), *pick-erel* (*little pike*). Diminutives.

Addition of the syllable *-ard*.—*Drunk-ard*, *stink-ard*.

Addition of the syllable *-old*.—*Thresh-old*.

Addition of the syllable *-ern*.—*East-ern*, *west-ern*, *north-ern*, *south-ern*.

Addition of the syllable *-ish*.—*Child-ish*, *Engl-ish*, *self-ish*, *whit-ish*. The original form was *-isk*; *cild-isc* (*child-ish*), *Engl-isc* (*English*), A. S.

Addition of the syllable *-ness*.—*Good-ness*, *bad-ness*, *wicked-ness*, *bright-ness*, *dark-ness*, *weari-ness*, *dreari-ness*, &c.

Addition of the syllable *-ster*.—*Song-ster*, *pun-ster*. Originally words in *-str-* were limited to the names of females.

Change of Sounds.—1. Consonants.—*Price*, *prize*; *cloth*, *clothe*;* *use*, *use* (pronounced *uze*); *grass*, *graze*; *grease* (pronounced *greace*), *grease* (pronounced *greaze*). In each of the pairs of words given above, the former is a substantive, and the latter a verb.

2. Vowels.—*Rise*, *raise*; *lie*, *lay*; *fall*, *fell*; *sit*, *set*. The generality of these words are verbs. There are, however, a few nouns, as *top*, *tip*; *cat*, *kit*.

* Pronounced *clothe*.

The termination *-ry* in words like *rookery*, *fishery*, &c., presents some difficulty. It is clear that the *-r* forms no part of the original word; for, though there is such a word as *fisher* = *fisherman*, there is no such word as *rooker*. Neither does *fishery* mean a collection of *fishermen*, but one of *fishes*. *Yeomanry* and *Jewry*, words of similar origin and meaning. They carry with them the idea of a collection, or assemblage. The words *Englishry*, *Danishry*, *Welshery*, are to be found in old authors.

Eyrie is generally said to mean the *nest* of an eagle. It rather means the *collection of eggs or eggery*.

COMPOSITION.

Substantives preceded by Substantives.—*Day-star*, *morning-star*, *evening-star*, *hazel-nut*, *fire-wood*, *sun-light*, *moon-light*, *star-light*, *torch-light*, &c.

Substantives preceded by Adjectives.—*Blind-worm*, *grey-beard*, *green-sward*, *black-thorn*, *mid-day*, *quick-silver*, *holy-day*, &c.

Substantives preceded by Verbs.—*Turn-spit*, *spit-fire*, *dare-devil*, *sing-song*, *turn-coat*, &c.

Substantives preceded by the form in *-ing*.—*Turning-lathe*, *sawing-mill*.

Adjectives preceded by Substantives.—*Sinful*, *thankful*, *blood-red*, *eye-bright*, *coal-black*, *snow-white*, *nut-brown*, *heart-whole*, *ice-cold*, *foot-sore*, &c.

Adjectives preceded by Adjectives.—*All-mighty*, *two-fold*, *many-fold*, &c.

Adjectives preceded by Verbs.—*Stand-still*, *live-long*.

Verbs preceded by Substantives.—*God-send*. Rare.

Verbs preceded by Adjectives.—*Little-heed*, *rough-hew*. Rare.

Verbs preceded by Verbs.—*Hear-say*. Rare.

Present Participles preceded by Adjectives.—*All-seeing*, *all-ruling*, *soft-flowing*, *fast-sailing*, *merry-making*.

Past Participles preceded by Adjectives.—*New-born*, *free-spoken*, *fresh-made*, *new-made*, *new-laid*.

Present Participles preceded by Substantives.—*Fruit-bearing*, *music-making*.

Past Participles preceded by Substantives.—*Heaven-born*, *bed-ridden*, *blood-stained*.

Verbal Substantives preceded by Substantives.—*Man-eater woman-eater*, *kid-napper*, *horn-blower*.

Verbal Adjectives preceded by Substantives.—*Mop-headed*, *chicken-hearted*.

Verbal Adjectives preceded by Adjectives.—*Cold-hearted*, *flaxen-haired*, *hot-headed*, *curly-pated*.

Adverbs entering into composition are of two sorts:—

1st. Those that can be separated from the word with which they combine, and, nevertheless, appear as independent words; as *over*, *under*, *well*, &c., in *over-do*, *under-go*, *well-beloved*, &c.

2nd. Those that, when they are separated from the verb with which they combine, have no independent existence as separate words; *e. g.* the syllables *be-*, *un-*, *a-*, in *be-hove*, *be-fit*, *be-rhyme*, *un-bind*, *un-do*, *un-loose*, *un-lock*, *un-wind*, *a-rouse*, *a-rise*, *a-wake*, *a-wak-en*, *a-bet*, *a-bide*.

SYNTAX.

§ 171. Syntax treats of the arrangement of words, and the principles upon which they are put together, so as to form sentences. It deals with groups or combinations of words; in this respect differing from Etymology, which deals with individual words only.

The notice of the Compounds of a language leads from Etymology to Syntax; for it is clear that in expressions like *hot-headed*, *horn-blower*, and the remainder of the preceding series, we have something more than an individual word, and, consequently, something which, in some sense, belongs to Syntax.

It is not always an easy matter to distinguish between two separate words and a Compound. A crow is a *black bird*. It is not, however, a *blackbird*. The best criterion is the accent.

When the two words are equally accented, the result is a pair of separate words, connected with one another, according to the rules of Syntax—the *crow is a bláck bírd*.

When the two words are *un*equally accented, the result is a Compound—as *the bláckbird is akin to the thrush*.

The Syntax of a language is always regulated by its Etymology; so that in those languages where the signs of Gender, Number, Case, Person, Tense, and Mood are numerous, the rules of Syntax are also numerous. On the other hand, where the Etymology is simple, the Syntax is of moderate dimensions.

In English, as has been seen, our Etymological forms are few. There were, for instance, but few Cases, and there were but few distinctions of Gender. The Adjective was remarkably wanting in forms: yet it is a part of speech which, in many languages, has, at least, two Genders—often three. In French, for instance, we say *le bon père* = *the good father*; but *la bonne mère* = *the good mother*. In Latin *bonus pater* = *good father*; *bona mater* = *good mother*; *bonum telum* = *good weapon*. Meanwhile, the Plural runs *boni patres*, *bonæ matres*, *bona tela*. The Frenchman who said *bon mère* or *bonne père* might be accused of making a false

Concord, inasmuch as he would join an Adjective in one Gender to a Substantive in another. No Englishman can possibly commit an error of this kind; because, in the word *good* there is no change at all, and, because, in English, we say *good father*, *good mother*, *good thing*, *good fathers*, *good mothers*, and *good things* indifferently.

The same applies to the Articles. In French there are the forms *un* and *une* = *a* (or *an*); along with *le*, *la*, *les*. Meanwhile, the German says *der*, *die*, *das*, and *einer*, *eine*, *eines*, where the Englishman says simply *the*, and *a* (or *an*). Of course, then, the rules for the Syntax of the Article must be simpler in English than in German.

On the other hand, English Syntax has certain decided peculiarities—peculiarities which require to be thoroughly understood, in order that certain difficulties and ambiguities may be avoided.

In languages where each part of speech has its own peculiar and characteristic termination it is scarcely possible to confound a Substantive with a Verb or a Verb with a Substantive. In English, however, where these distinctive signs are rare, it is, by no means easy, in all cases, to separate them. Take, for instance, the word *black*. It is, doubtless, in its origin, adjectival; and if we ask what it is, as a part of speech, the answer is that *it is an Adjective*. As such, we can give it the degrees of Comparison, and say (for instance) *this ink is black, this is blacker, but that is the blackest of all.* But what when we use such an expression as the *blacks of Africa* or the *blacks are falling*, where there is the sign of the plural number? Surely, we must say that *black* means *black man*, or *black thing*, and that the word is no longer an Adjective but a Substantive.

But this is not all. The word may be used as a Verb and a Participle, and the man who has *had his shoes blacked* may say that *the little boy at the corner of the street blacked them.*

A little consideration will teach that, in most cases, the laws of Syntax are neither more nor less than the dictates of common sense applied to language, and that, in many cases, the ordinary rules are superfluous. This applies most especially to the Concords, or Agreements. No one, who speaks English, need be told that in speaking of a man we say *he;* a woman, *she;* an inanimate object, *it.* In doing this we suit the Pronoun to the Substantive, and use a masculine, a feminine, or a neuter form accordingly. Consequently, the words seem to agree with one another. It would, however, be strange if they did not. The word *man* is the name of a male. The pronoun *he* is the same. They are applied to the same object.

Again—if certain Pronouns, such as *they*, apply only to a number of individuals, and never to a single person, and if such a verb as *calls* applies to a single individual only, and never to a number, it requires no great amount of ingenuity to discover that

such an expression as *they calls* is nonsensical. *They* denotes a multitude; *calls* a single individual. How can the two be united?

It is, of course, useful to know that the first of these instances gives what the grammarians call a Concord of Gender; the second a Concord of Number. Common sense, however, lies at the bottom of both. A Substantive and a Pronoun which each denote an object of the same sex cannot fail to be in the same Gender, and because they are this, they are said to agree with one another. In like manner a Pronoun and a Verb, when each means the same person or the same number of persons, exhibit the Concords of Person and Number.

Some sentences consist of a single proposition, as—*the sun shines;* others, of two propositions combined, as—*the sun shines, and therefore, the day will be fine.*

This is made plainer by writing the words thus—

The sun shines,
and therefore
The day will be fine.

The Syntax of Single Propositions, being the simplest, comes first under notice.

SYNTAX OF PRONOUNS.

As the Pronouns had the fuller inflection, they preceded both the Substantive and the Adjective when we treated of their Etymology. For the same reason they come first in Syntax.

Whether we say *feed the horse* or the *horse feeds* is indifferent; inasmuch as, in *Substantives* like *horse*, there is no difference between the Objective and Nominative.

Whether we say *a good book* or *good books* is indifferent; inasmuch as, in *Adjectives* like *good*, there is no difference between the Plural and the Singular.

Whether we say *feed he* or *feed him* is by no means indifferent; inasmuch, as in *Pronouns* like *he*, &c., the Objective and the Nominative differ.

Whether we say *this book* or *these books* is by no means indifferent, inasmuch, as in *Pronouns* like *this*, &c., the Plural and the Singular differ.

§ 172. *His* and *her* are personal pronouns in the Possessive Case rather than true Possessive Pronouns. If it were not so, such expressions as *his mother* and *her father* would be ungrammatical. In other words they are the equivalents to *ejus* rather than *suus*.

§ 173. With *my*, *thy*, *our*, *your*, *her*, and *their*, the

Substantive is expressed; as, *this is my hat*. We cannot say, *this hat is my*.

§ 174. With *mine*, *thine*, *ours*, *yours*, *hers*, and *theirs*, the Substantive is understood; as, *this hat is mine*. This would be in full, *this hat is my hat*.

§ 175. *His* and *its*, on the contrary, can be used either in union with the Substantive or without it—*this is his hat; this is its home.—This hat is his; this ome is its*.

§ 176. In expressions like *they say*, &c., *they* means *the world at large*, or *people in general*. This is the Indeterminate use of the Pronoun.

§ 177. *One says* is also an Indeterminate expression, wherein *one* is not the Numeral, but the French word *on* in *on dit*.

§ 178. *It* is also Indeterminate. It stands for an unexpressed but understood *Subject*.

§ 179. So is *there*. It stands for an unexpressed but understood *Predicate*.

In such phrases as *it rains*, *it snows*, *it freezes*, it would be hard to say, in express terms, what *it* stands for. Suppose we are asked *what rains? what snows? what freezes?*—the answer is difficult. We might say *the rain*, *the weather*, *the sky*, or what not? Yet, none of these answers are satisfactory. To say the *rain rains*, *the sky rains*, &c., sounds strange. Yet we all know the meaning of the expression—obscure as it may be in its details. We all know that the word *it* is essential to the sentence; and that if we omitted it and simply said *rains*, the grammar would be faulty. We also know that it is the Subject of the proposition—a point of knowledge which is of great importance.

The following extract from an old grammar illustrates this difficulty. The word *Deus* (*God*) was held to be the Subject in such indeterminate expressions as the ones just under notice.

Pluit,	raynes	Deus meus.
Gelat,	freses	,, tuus.
Degelat,	thowes	,, suus.
Ningit,	snawes	,, ipsius.
Tonat,	thoneres	,, sanctus.

Grandinat,	hayles	Deus omnipotens.
Fulgurat,	lownes	,, creator.
Fulminat,	*idem,*	,, dat omnia.

Just as *it,* when it begins a proposition, is a Subject, so is *there* a Predicate. It is a Predicate, however, which *begins* the Proposition in which it occurs, and, so doing, looks like a Subject. In this lies its Indeterminate character. If I say *something wrong is there,* or (*thieves are there*) the person to whom I speak imagines that I know the place where the *wrong* or the *thieves* are to be found. This is because I use the word *there* in a determinate sense. If, however, I say *there is something wrong,* or *there are thieves in the house,* I imply, that, though I know of mischief, and though I know of robbery, I do *not* exactly know the point where they are to be discovered. This is because *there* is Indeterminate.

Nevertheless, it is the Predicate of the proposition: the word which follows the verb being the Subject.

§ 180. In Indeterminate sentences beginning with *it* the verb is Singular.

§ 181. In Indeterminate sentences beginning with *there* the verb is either Singular or Plural, as the case may be. It is Singular when the noun which follows it is Singular, and it is Plural when it is Plural. We say,

There *is* something wrong.
There *are* thieves.

§ 182. *An* is called the Indefinite Article, because it specifies no object in particular. It is only used before words beginning with a vowel. Before a consonant, a semivowel, or *-h,* it loses the *-n* and becomes *a;* as, *an ant, an egg—a man, a pan.*

Amongst the curiosities of language we may reckon the words *adder, nag, newt,* and a few others. The German for *adder* is *natter,* the Danish for *nag* is *øg. Newt* is the same word as *eft.* In all these, there has been a confusion between the final *-n* of the Article, and the initial of the Substantive; so that, whilst *a nadder* has been divided as if it were *an adder, an ag* has been divided as if it were *a nag.* In an old vocabulary for the use of boys learning Latin the following misdivisions occur. Unlike,

however, the words just noticed, they have failed to become permanent.

Hec auris	a *n*ere	*i. e.* an ear.
hec aquila	a *n*eggle	,, an eagle.
hec anguilla	a *n*ele	,, an eel.
hec erinaceus	a *n*urchon	,, an urchin.
hic comes	a *n*erle	,, an earl.
hic senior	a *n*ald man	,, an old man.
hic exul	a *n*owtlay	,, an outlaw.
hic lutricius	a *n*otyre	,, an otter.
hec alba	a *n*awbe	,, an aube.
hec amictus	a *n*amyt	,, an amice.
hec securis	a *n*ax	,, an axe.
hec axis	a *n*axyltre	,, an axletree.
hec ancora	a *n*ankyre	,, an anchor.

§ 183. When two or more Substantives come together, meaning different things, the Article stands before each. When the offices are separate we say, *the secretary and the treasurer*.

§ 184. When two or more Substantives come together, meaning the same thing, the Article stands before the first only. When the two offices are held by the same person we say, *the secretary and treasurer*.

§ 185. In a few instances the simple personal is used instead of the Reflective Pronoun, *i. e.* we say *him* instead of *himself*—

> He sat *him* down at a pillar's base.—Byron.

§ 186. When any word comes between the personal pronoun and *self*, the personal pronoun is always in the Possessive Case, as *my own self*, *our own selves*, *his own self*, *its own self*, *their own selves*.

§ 187. In *myself*, *thyself*, *ourselves*, and *yourselves*, the construction is that of an ordinary Substantive preceded by a Possessive case. *Myself* means *my personality*, *individuality*.

§ 188. When *himself* and *themselves* are in the nominative case, they may be looked upon as improper compounds, and treated as single words. *He himself is coming—they themselves are here.*

§ 189. When *himself* and *themselves* are in the accusative case, they must be looked upon as instances of apposition. *He hurries himself—they busy themselves.*

§ 190. In *herself* the construction is ambiguous. We cannot say whether the first syllable is Possessive or Objective.

§ 191. In *itself* the construction is also ambiguous. We cannot say whether the original form was *it-self* or *its-self*.

These details deserve attention. In the first place *self* is one of those words which are dealt with more correctly in the language of the uneducated classes than in the language of literature. In the provincial dialects they are used rightly; in books wrongly. Many an individual has been laughed at for saying *his-self* and *their-selves*, instead of *him-self* and *them-selves;* and that by speakers who would be shocked at hearing *me-self*, or *thee-self*, instead of *myself*, or *thyself*. In strict grammar, however, *his-self* and *their-selves* are right.

For the purposes of grammar *self* is a Substantive; and, after the manner of Substantives should it be treated. It means *personality*, or *individuality*, and should enter into the structure of sentences accordingly. Like an ordinary Substantive, it has a plural number, and we say *myself* and *ourselves* just as we say *my personality*, or *our individualities*. Such being the case, expressions like *himself* and *themselves* are as objectionable as *him personality*, or *them individualities*. Custom, however, has given currency to an inconsistent use of the word.

§ 192. The numeral *one* is naturally singular. All the others are naturally plural.

§ 193. The numeral *one* is naturally singular. So is the Indefinite Article *an* (or *a*). At the same time we say *a hundred*, *a thousand*, and the like; the words *hundred* and *thousand* being collective.

§ 194. The Noun with which a Plural Numeral is joined is often in the Singular Number. Many say *twenty pound* instead of *twenty pounds*.

§ 195. The *two first* is by no means the same as the *first two*. The *two first boys of their class* are the captains of two different classes. The *first two boys* are the captain and second of the same class.

SYNTAX OF SUBSTANTIVES.

§ 196. The Possessive Case implies ownership—*John's picture* means the *picture* which *is owned by John*. *A picture of John* means a *picture in which John is represented*.

§ 197. In the names of a few well-known objects the Possessive Case can stand by itself; as *St. Paul's*, *St. Bride's*, *Rundell and Bridge's*, &c. Here the words *Cathedral*, *Church*, *Shop*, or the like, are understood.

SYNTAX OF ADJECTIVES.

As Adjectives have neither Case nor Number, nor yet Gender, their Syntax is simple. It chiefly refers to the degrees of Comparison.

§ 198. The Adjective generally precedes the Substantive; as, a *good man*, not a *man good*. In many other languages the order is reversed. Even in English we may use such expressions as *a man just and good*, *a woman wise and fair*, *a hero devoted to his country*.

§ 199. When two objects are compared, the Comparative, when more than two, the Superlative De-

gree, should be used—*this is the better of the two, but this is the best of all.*

§ 200. The Positive preceded by the word *more* may stand instead of the Comparative. We may say *more wise* instead of *wiser*.

§ 201. The Positive preceded by the word *most* may stand instead of the Superlative. We may say *most wise* instead of *wisest*.

§ 202. Sometimes both signs may be used; as, *the more serener spirit, the most straitest sect.*

These latter combinations are good instances of Pleonasm. Those like *more wise* and *most wise* require a further notice. That they can be used is universally known. Neither is there anything remarkable in their syntax. Common sense tells us what they mean. When, however, do we use the one form, when the other? This depends upon the nature of the Adjective. In general terms, we may say that the object of the circumlocution is to keep the length of the word within certain limits. It is, *probably*, better to say *more fruitful* than *fruitfuller*. It is *certainly* better to say *more pusillanimous* than *pusillanimouser*. But it is doubtful whether this is the only rule to go by. A great many Adjectives (*fruitful* amongst the number) are Compounds, in which case the addition of an *extra* syllable presents an accumulation of subordinate parts, which, to some speakers, may be inconvenient or disagreeable. Thirdly, there is a large number of Adjectives which are of foreign origin. To some of these an English affix like *-er* or *-est* would be exceptionable.

Thus much, however, may safely be said—

1. That when the word is, at one and the same time, monosyllabic and English in origin, the forms in *-er* and *-est* are preferable.

2. That when the word is trisyllabic, compound, and of foreign origin, the combinations in *more* and *most* are to be resorted to.

For intermediate cases the writer may consult his own taste. Of dissyllables, the words that end in *-y* are those that, next to our native monosyllables, have the best claim to be inflected—as *holy, holier, holiest—manly, manlier, manliest*; upon which we may remark, by the way, that they are all Anglo-Saxon.

In these *y* is changed into *-i-*, just as it was in the plural of Substantives like *quantity* (*quantities*) and the preterite of Verbs like *cry* (*cried*).

§ 203. The word *like* governs an Objective Case, as *this is like him*, and it is the only Adjective that does so.

We now pass from the consideration of the Adjective to that of the Participle. Before, however, we treat of the details of its Syntax we must guard against the very common error of supposing that all words which end in *-ing* are Participles. In expressions like *seeing is believing*, and many others, the forms in *-ing* are no Participles but Substantives.

§ 204. The Syntax of the Participle is, to some extent, the Syntax of the Adjective. We may say *I am tired*, or *he is weeping*, just as we may say *I am weary*, or *he is sad*.

§ 205. A Participle, like an Adjective, can form the Predicate, but not the Subject, of a Proposition; as, *I am writing*, *he is speaking*, *the dog is barking*.

§ 206. A Participle, like an Adjective, is wholly destitute of *actual* inflection. We say *I am*, *thou art*, *he is*, *she is*, *it is*, *we are*, *ye are*, *they are*—*speaking*. We also say, *I heard him*, *her*, *it*, or *them*—*speaking*.

§ 207. A Participle, however, like an Adjective, must be considered in respect to its *virtual* Cases, *virtual* Numbers, and *virtual* Genders.

§ 208. The Past Participle combines with both *am* and *have*, as *I am called*, *I have spoken*.

§ 209. The Present Participle combines with *am*, but not with *have*. We say *I am calling*. No one says *I have coming*.

Such a phrase as *I have been calling* is no exception to the rule: inasmuch as *been* is the word which unites to *have*, whilst *calling* depends upon *been*.

§ 210. Combined with *am*, *art*, &c., the Participle is in the same Case with the Noun.

§ 211. Combined with *have*, the Participle is in the Accusative Case and Neuter Gender.

This occurs in phrases like *I have spoken, I have slept, I have moved, I have written;* where *have* is in the present tense, and where *spoken, slept, moved, written*, are past passive participles. The phrases *I had spoken, I had moved*, &c., are in the same predicament, except that *had* is in the present tense. *I had been moved, I shall have struck*, are modifications of the same construction, the phrase being somewhat more complex. Now, in all the phrases quoted above, the word *have* has the same power. It indicates *past time although it be itself in the present tense.*

As the natural meaning of the word *have* denotes *possession*, it may naturally be asked how it comes to mean *past time.* The difficulty that here arises becomes more visible, if we substitute for the word *have* some word of similar meaning, such as *hold, possess*, or *own.* To say *I own written a letter, I possess written a letter, I hold written a letter*, sounds as nonsense ; at any rate, it gives no such a meaning as is given by the words *I have written a letter.* A little consideration, however, will show how the power of expressing *past time* may arise out of the idea of *possession.* In the first place, it is very evident, that, in order for a person to possess an object, the object must be in existence. We cannot say that a man *has a written letter*, without also implying that *a letter has been written.* Hence the idea expressed by the words *I have a written letter*, or *I have a letter written*, is allied to the idea expressed by *I have written a letter.*

The proofs that the view above is the true one are as follows:—

1. In certain other languages we find other words besides *have* expressive of possession, used for the sake of denoting past time ; *e. g.* in Spanish the word *tengo* = *I hold*, and in Old High-German the word *eigan* = *to own.* Here, phrases like *I hold ridden, I own ridden* = *I have ridden*, are actually existing.

2. In Old High-German, Old Saxon, and Anglo-Saxon, we have the order of the participle and substantive occasionally reversed ; *e. g.* instead of saying *I have forgotten it, I have chosen him, I have made one;* the phrases ran, *I have it forgotten* (i. e. *I possess it as a forgotten thing*), *I have him chosen* (i. e. *I possess him as a chosen person*), *I have one made* (i. e. *I have one as a made thing*).

3. That, in languages where there is a sufficient amount of inflection to exhibit the participle as agreeing in case, number, and gender with the substantive to which it applies, such agreement is exhibited. In Latin we find expressions like *literam scriptum habeo* = *I have, as a thing written, a letter*, or *I have written a letter.*

Observe the word *thing*. It is not with the substantive that appears in the sentence; but with the substantive understood that the participle agrees. Doing this, it is neuter.

§ 212. Participles denote actions rather than qualities. *I am tired* is different from *I am weary; the sun is shining* is different from *the sun is bright.*

§ 213. Every Participle is derived from a corresponding Verb; as *tiring* from *tire*, *shining* from *shine.*

§ 214. A Participle, like a Verb, can govern a Case. We say *I am calling him*, just as we say *I call him.*

§ 215. In respect to its Concords the Participle is an Adjective; in respect to its Government a Verb.

§ 216. When a Participle is more of a Verb than an Adjective it *follows* its Substantive, as—*I am thinking, I saw a vessel sailing.*

§ 217. When a Participle is more of an Adjective than a Verb it *precedes* its Substantive, as—*a thinking man, a sailing vessel.*

§ 218. Participles, when used as Adjectives, can be preceded by the words *very*, *more*, and *most*, *less* and *least;* as *a very loving couple; a more shining light; a most thinking man.*

§ 219. A Verb is a word which can form both the Predicate and the Copula of a Proposition: as *Fire burns.*

§ 220. Every Verb has its corresponding Participle. From *come*, *plant*, *write*, we get *coming*, *planted*, *written.*

§ 221. As the Participle agrees with the Adjective, and as the Infinitive Verb agrees with the Substantive, Verbs are susceptible of Inflection.

§ 222. So far as the Verb is related to the Noun, it is Declined. So far as it is characterized by peculiarities of its own, it is Conjugated.

§ 223. Verbs must be considered in respect to *Mood*, *Tense*, *Person*, and *Number*.

§ 224. The Imperative can only be used in the Second Person. It applies to the person spoken to, and to him only.

§ 225. It can be used in both Numbers; inasmuch as we can speak to either one individual or more than one.

§ 226. It can, as has been already stated, dispense with the Pronoun, inasmuch as we can say *walk*, *stop*, *speak*, &c. But it can also be accompanied by one.

§ 227. When an Imperative is accompanied by its Pronoun, the Pronoun, instead of preceding the Verb, *follows* it. We say *walk thou; speak thou;* rather than *thou walk*, *thou speak*.

§ 228. Negative Imperatives are generally expressed by the auxiliar *do*. We say *do not hurry*, more frequently than *hurry not*.

The use of the words *you* and *ye* may now be noticed. They occur in conjunction with other Moods besides the Imperative. They occur, however, oftener with Imperatives than aught else. However much we may be told in the Etymological part of our grammars that *ye* is in the Nominative and *you* in the Objective Case, and however much the theoretical views of the English language may favour this view, it is clear that there is a great deal of confusion between the two. Dr. Guest has well remarked that at one time the two forms were nearly changing place; in proof of which he gives the following examples:

> As I have made *ye* one, lords, one remain;
> So I grow stronger *you* more honour gain.
>
> *Henry VIII.* iv. 2.
>
> What gain *you* by forbidding it to teaze *ye?*
> It now can neither trouble you nor please *ye.*
>
> *Dryden.*

Nor is this all. *Ye* may not only be either Objective or Nominative, but it may stand for *yourselves;* so that, in many expressions, the construction is ambiguous. *Mount ye* may mean either *be ye mounted*, or *mount yourselves*.

In *Henry IV.*, Falstaff says to the Prince of Wales, "Rob *me* the exchequer, Hal." Here *me* is a kind of Dative, and means *for me*, or, *at my request*.

§ 229. When two verbs come together, the latter is either a Gerund or an Infinitive Mood.

§ 230. The Gerund is preceded by *to*, as *I began to speak;* which was in A. S. *Ic ongann to sprecanne*.

§ 231. When the construction is Infinitive, *to* is omitted.

Only a few words dispense with the Preposition; *e. g.* we say:—

I may go,	*not*	I may *to* go.
I might go,	,,	I might *to* go.
I can move,	,,	I can *to* move.
I could move,	,,	I could *to* move.
I will speak,	,,	I will *to* speak.
I shall wait,	,,	I shall *to* wait.
I should wait,	,,	I should *to* wait.
Let me go,	,,	Let me *to* go.
He let me go,	,,	He let me *to* go.
I do speak,	,,	I do *to* speak.
I did speak,	,,	I did *to* speak.
I dare go,	,,	I dare *to* go.
I durst go,	,,	I durst *to* go.

§ 232. In Syntax we talk of Time; in Etymology of Tenses. It is not every Time that has a Tense to match.

§ 233. To denote an action actually Present, we use the Present Participle preceded by *am*, *art*, *is*, &c. *I am speaking and you are interrupting me*.

This shows that, in the case of the *Present* Tense, at least, the name by no means accurately coincides with its meaning; a fact to which the attention of the student is most especially invited. When a person says that *he sleeps well*, the chances are that he is awake at the very time he makes the announcement. When he

says *I dine at one and sup at nine* he cannot be taking both meals at once. That the *sun rises every morning* may be said either at noon or at midnight. What, then, does the present denote? It denotes *habits*, and, if it were not the novelty of the expression, might be called the *Habitual* tense. To say that *a man rides well* is to say that he is a good rider. To say that *I dine at one* means that a dinner at that hour is my usual custom.

§ 234. To denote an action which took place in past time, but which was interrupted, we use the Present Participle preceded by *was*, *were*, &c. *I was speaking when he interrupted me.*

In this there is a mixture of the Past time with the Present. The *act of speaking* and the interruption may have taken place a thousand years ago. Hence, both *was* and *interrupted* are Past tenses. Nevertheless, the *speaking* and the *interruption* were simultaneous; *i. e.* they were *Present* to one another, and *speaking* is a *Present* Participle.

§ 235. To denote an action which has taken place in past time, but of which the effects are present, we use the Preterite Participle preceded by *have*, &c. *I have spoken and mean to speak again.*

There is a mixture of Past time and Present in all expressions of this kind. We see this in the very form of them. *Have* is a Verb in the Present Tense; *spoken* a Past Participle. A Past time, however, of this kind has always some reference to the Present.

1. *I have learned my lesson* may imply either *I am ready to say it;* or, *I don't mean to learn it again.*

2. *What I have written I have written*, implies *I am prepared to stand by the consequences.*

In *I learned* or *I wrote* there is no such Present element.

§ 236. To denote a Future action we use the Infinitive preceded by *shall* or *will;* as *I shall speak, he will conquer.*

1. Where the Englishman says *to be moved*, the ancient Roman said *moveri;* the former using a combination of words, the latter a single word in a particular Mood, Tense, and Voice—*moveri* being the Present Tense of the Infinitive Mood of the Passive Voice of *moveo.* Upon the same principle—

2. The English *I am, thou art, he is, we are, ye are, they are moving*, were, in Latin, *moveo, moves, movet, movemus, movetis, movent;*

3. Also, *I was, thou wast, he was, we were, ye were, they were moving*, were *movebam, movebas, movebat, movebamus, movebatis, movebant;*

4. Also, *I have, thou hast, he has, we have, ye have, they have bitten*, were *momordi, momordisti, momordit, momordimus, momordistis, momorderunt;*

5, 6.—Also, *I shall, or will, call*, &c., were *vocabo, vocabis, vocabit, vocabimus, vocabitis, vocabunt.*

7. Also, *let us go = eamus.*

8. Also, *I have come (veni) that (ut) I may see (videam) = veni ut videam;* whilst *I came that I might see = veni ut viderem.*

In all these instances the Latin uses a single word, *i. e.* a verb in a certain Mood, Tense, or Voice, which Mood, Tense, or Voice, is characterized by its particular inflection. In English, however, we look for these inflections in vain. There are *some few* signs of Tense and Mood—but only *some few*. The amount of inflection exhibited in the Latin is wholly wanting.

We have, however, something in the place of it. By combining the words *be, am, have*, &c., with our Infinitives and Participles we get, if not an actual inflection, an equivalent to one. The Verbs that help us to this are called the *Auxiliars*.

§ 237. In many languages the subject of the Verb, when a Pronoun, is omitted. In Latin *Ego = I, tu = thou, is = he, nos = we, vos = ye, ii = they*. In Latin, however, it was, by no means, necessary to say *Ego voco, tu vocas*, &c. It was sufficient to say—

Voco,	*I call.*	*Vocamus,*	*We call.*
Vocas,	*Thou callest.*	*Vocatis,*	*Ye call.*
Vocat,	*He calls.*	*Vocant,*	*They call.*

§ 238. Except in three small classes of words, the Pronoun in English is always expressed. We cannot say *speakest*, however much the termination *-est* may suffice to show that the word is in the second person. On the contrary, *thou speakest* is the form that must be used.

§ 239. The cases where the Pronoun may be omitted are (1) that of the Imperative Mood, (2) that

of the Optative Preterite, and (3) that of the three Impersonals.

§ 240. In Imperative Propositions the Subject, being the name of the person spoken to, is suppressed without either ambiguity or inconvenience. We may say—*walk thou—hold thou thy tongue:* but we may also say—*walk—hold thy tongue.*

§ 241. The word *would*, expressive of a wish, can stand by itself, *i. e.* without any personal pronoun to precede it. We may say—*I would I could:* but we may also say—*would I could.*

§ 242. The three Impersonals are *Methinks, Meseems, Me listeth.*

§ 243. In Anglo-Saxon þ*encan* signified *think*, whilst þ*incan* meant *seem.* Hence, *methinks* and *meseems* mean the same, viz. *it seems, or appears, to me.* Here *me* is in the condition of a Dative Case, and *it* is suppressed or understood. *Me listeth* means *it pleases me.*

§ 244. The Pronoun generally precedes the Verb. Expressions like *said I*, or *says he*, instead of *I said*, or *he said*, are only admitted in very familiar discourse.

§ 245. One verb, however, *always* precedes its pronoun. We always say *quoth he;* never *he quoth.*

§ 246. The second person Singular is only used in solemn discourse, and by members of the Society of Friends. Instead of *thou speak-est* we say *you speak.*

The use of *shall* and *will* in connection with the Person of the Verb they precede, has, probably, given rise to more discussion than all the other points of English Grammar put together. In so small a work as the present, the general rule is all that can be

given. There are two ways in which we may speak of a future event. We may simply *predict*, or we may *promise*, that it will take place. When the proposition which delivers the assertion is simply *predictive*, it means that something will happen hereafter; but says nothing about the intention of the speaker in regard to it. The *promissive* expression brings-in the intention or will of the speaker.

This prepares us for believing that *shall* is the Predictive, *will* the Promissive, Verb. And so they are *to some extent*. A man in a house a-fire says *I* shall *be burned if I don't get out*, where assuredly there is no *intention*, or *will*, on his part.

On the other hand, one of the ancient martyrs, when offered his choice between the stake and the renunciation of his religion, would say *I* will *be burnt*.

So far, so good. The speaker, however, who uses *shall* as the Predictive, uses it for the *first* Person only, reserving *will* for the *second* and *third;* Conversely, *will* is Promissive only when conjoined with *I*. The Promissive for the *second* and *third* person is *shall*.

Wallis's rule, then, runs thus—"In the first person *shall* predicts; whilst *will* promises or threatens. In the second and third persons *shall* promises or threatens; whilst *will* simply predicts."

Predictive.

Singular.	*Plural.*
1. *I* shall *burn.*	1. *We* shall *burn.*
2. *Thou* wilt *burn.*	2. *Ye* will *burn.*
3. *He* will *burn.*	3. *They* will *burn.*

Promissive.

Singular.	*Plural.*
1. *I* will *burn.*	1. *We* will *burn.*
2. *Thou* shalt *burn.*	2. *Ye* shall *burn.*
3. *He* shall *burn.*	3. *They* shall *burn.*

§ 247. A Singular Subject may have a Plural Predicate; *e.g. sixpence* is *twelve halfpennies; he* is *all head and shoulders.*

§ 248. A Plural Subject may have a Singular Predicate; *e.g. honest men* are *the salt of the earth.*

§ 249. Every Transitive verb is followed by either a Substantive or a Pronoun.

§ 250. The Substantive or Pronoun that follows

a Transitive verb is always in the Objective case. Hence—

The same word has often two meanings, one of which is transitive and the other intransitive; as,

I move,—where the verb is intransitive, and denotes the mere act of motion, contrasted with *I move my limbs,*—where the verb is transitive, and where the action affects a certain object (*my limbs*); or

I walk,—where the verb is intransitive, and denotes the mere act of walking, contrasted with *I walk the horse,*—where the words *I walk* are equivalent to *I cause to walk.*

This fact of the same verb having transitive and intransitive meanings must be continually borne in mind; otherwise transitive verbs will appear to be without an objective case, and intransitive verbs to govern one.

§ 251. An Adverb can form, *by itself*, neither the Subject, nor the Predicate of a Proposition. Still less can it form the Copula. How, then, do Adverbs enter into the composition of sentences?

§ 252. Adverbs, by combining with an Adjectival Pronoun, an Adjective, a Participle, or a Verb, form the *parts* of terms—parts of either Subjects or Predicates, *e.g. the* very *wisest men are liable to be deceived;* and *young men are* very *liable to be deceived.*

§ 253. Adverbs denote *manner*, *time*, *order*, *place*, *degree*, *number of times*, &c., &c.; as—the sun shines *brightly;* the sun shines *to-day;* the sun shines *very brightly;* the sun shines *brightly here;* the sun has shone *brightly twice this week.*

Under two circumstances, even Intransitive Verbs may be followed by Nouns in the Objective Case. Whether, however, this gives us a true instance of Government is uncertain.

1. In such an expression as *I have walked ten miles*, the Verb *walk* is Intransitive; yet the Substantive *miles* follows.

2. Again, to *sleep the sleep* (or *die the death*) *of the righteous* is to perform an act which is anything but transitive; however transitive may be the construction.

Now in both these instances the sense is, more or less, Adverbial,

and the construction is the same. Adverbs give the *manner*, *time*, *degree*, &c., in which acts are performed; and it is clear that to *walk ten miles* is to walk in a *certain manner*, or to a *certain degree*. In like manner, to *sleep the sleep of the righteous*, is to *sleep after the manner of a righteous man*.

In this last instance the Noun is said to be *cognate* to the Verb; and there is an old rule to the effect, that *any Verb whatever, whether Transitive or Intransitive, can be followed by a Noun in the Objective Case, provided that Noun be a Cognate one.*

§ 254. A Preposition can form, *by itself*, neither the Subject nor the Predicate of a Proposition. Still less can it form the Copula. How, then do Prepositions enter into the composition of sentences?

§ 255. Prepositions, by combining with Pronouns and Substantives, form parts of *terms*—parts of either Subjects or Predicates.

§ 256. Prepositions give the relation of one Noun to another; *e.g. I was* in *London, the sun shines* through *the air* with *its beams, he spoke* to *me, I thought* of *him*, &c.

§ 257. Every Preposition governs a Case; and unless a word do so it is no Preposition.

This enables us to separate Prepositions from Adverbs: and, as several words are doubtful, the test is important. To *get on* is to *proceed;* to *go up* is to *ascend*, in which instances the words *on* and *up* are Adverbs, meaning *onwards* and *upwards*. In *get on the horse* and *climb up the tree*, the same words are Prepositions governing a Case. So also

Adverbs.	*Prepositions.*
Put it *in*.	Put it *in the box*.
Pass *by*.	Pass *by the place*.
Go *out*.	Bring it *out of the box*.

The difference between the Preposition and the Conjunction will be seen in the sequel.

It by no means follows that, because a Noun is immediately preceded by a Preposition, it is *governed* by it. In such an expression as *this is a picture of John's*, the word which the Preposition *of* governs is not *John's*, but *pictures* understood; the full sentence being *this is a picture of John's pictures.*

Expressions like *the King of Saxony's army*, or, *the Queen of England's crown*, are somewhat more obscure, the sign of the Possessive Case being attached to the words *Saxony* and *England*. Yet the possessors of the *army* and the *crown* are not the countries of *Saxony* and *England*, but the *King* and *Queen* who rule over them. The truly accurate construction would be *of Saxony, the King's army—of England, the Queen's crown;* or (perhaps) *the King's army of Saxony, the Queen's army of England.* In other words the *'s*—the sign of the Possessive Case—really belongs to *King* and *Queen*.

§ 258. Sentences consisting of two Propositions are called Complex. They always contain either a Relative Pronoun, as *the sun, which shines to-day will shine to-morrow*, or a Conjunction, as *the sun shines, and therefore the day will be fine.*

Sometimes the structure of these complex sentences is extremely simple. This is the case when the second proposition follows the first, and the two stand apart from each other, in such a way as to be easily separated. If I say the *man is coming who brings the letters*, we know exactly where one proposition ends, and where the other begins. We find, too, that the analysis of the expression is of the easiest. We see that *the man is coming* constitutes one proposition; *who brings the letters*, another. We see that two actions are denoted, (1) the act of *coming;* (2) the act of *letter-carrying.* We see, too, that, although there are two actions, there is but one agent; for the man *who comes* is the same person as the man who *carries the letters.* Such being the case, the word *who* means *the man*, and *relates* to it; whilst the word *man* explains what is meant by *who*, and *goes before it.*

To show that *who* means *the man*, we may, if we please, write

The man is coming,
He brings the letters.

or,

The man is coming,
The man brings the letters.

The result is the same. There are two actions and one agent. Instead, however, of naming the agent twice, we use a word that *relates* to him, or a *Relative;* the word to which it relates being called an *Antecedent.*

All this is clear. It is, however, well known that, although complex sentences, like the one just given, are easily constructed, they

are, by no means, very common in the actual course of language; wherein few persons keep the two propositions separate. On the contrary, they blend them together, and say *the man who brings the letters is coming*. This, although it adds a little to the complexity, ought not to create a difficulty. A little consideration tells us that we may say

1. The man is coming; the man brings the letters; *or*,
2. The man is coming; he brings the letters; *or*,
3. The man is coming; who brings the letters; *or*,
4. The man [who brings the letters] is coming.

The Relative means the same as the Antecedent, and is only the Antecedent under another form.

§ 259. The Relative and the Antecedent are, of necessity, in the same Gender.

§ 260. The Relative and Antecedent are, of necessity, in the same Number.

On the other hand, the Relative is *not* necessarily in the same *Case* as the Antecedent; *e. g.*

1. John [*who* trusts me] comes here;
2. John [*whom* I trust] comes here;
3. John [*whose* trust is in me] comes here;
4. I trust John [*who* trusts me].

§ 261. The Relative is occasionally omitted; *e.g.* we may say *the books I want are come*, instead of *the books which I want*, &c.

There are few better specimens of a true Ellipsis than a sentence of this sort. If written in full it would exhibit three essential elements; viz. the first proposition, the second proposition, and the relative, by which they are connected. In the instance before us, the first proposition is *the books are come;* the second, *I want*. Where, however, is the word that connects them?

§ 262. Conjunctions connect Terms, as, *all men are black or white*.

§ 263. In general, a difference of Terms corresponds with a difference of Propositions; so that in most cases, Conjunctions connect Propositions as well as Terms.

The day is warm
because
The sun is bright.

§ 264. When two Propositions have the same Subject, they look like a single one; though, in reality, the Subject is repeated, and the Propositions are double.

The sun is bright and warm,
is, in full,
The sun is bright,
The sun is warm.

§ 265. When two Propositions have the same Predicate, they look like a single one; though, in reality, the Predicate is repeated, and the Propositions are double.

The sun and moon shine,
is, in full,
The sun shines.
The moon shines.

§ 266. When the Predicate applies to one of two Subjects, it is in the Singular Number.

The sun or moon shines,
is, in full,
The sun shines
or
The moon shines,
i.e.
One of the two shines.

§ 267. When the Predicate applies to more than one subject, it is in the Plural Number.

The sun and moon shine,
is, in full,
The sun shines
and
The moon shines,
i.e.
Both shine.

§ 268. Conjunctions which connect two or more Terms are called Copulative; as *and*.

§ 269. Conjunctions which connect one of two Terms are called Disjunctive; as *or*.

§ 270. Disjunctives are either true Disjunctives or Subdisjunctives.

§ 271. A true Disjunctive separates *things*. When we say *the sun or the moon is shining*, we separate two different objects, one of which shines by day, the other by night.

§ 272. Subdisjunctives separate *names*. When we say *Victoria, or the Queen of England, is our sovereign*, we speak of the same object, under different names.

§ 273. The idea expressed by a Copulative may be strengthened and made clearer by the addition of the words *each*, *both*, *all three*, or the like. We may say *both sun and moon are shining—all three, Venus, Jupiter, and the Dogstar are visible*. We may also say *sun and moon are both shining—Venus, &c., are all three visible*.

§ 274. The idea expressed by a Disjunctive may be strengthened and made clearer by the addition of *either*. We may say, *either the sun or the moon is shining*.

§ 275. The idea expressed by a Subdisjunctive may be strengthened and made clearer by the phrase *in other words*. We may say *Queen Victoria, in other words, the Queen of England*, &c.

§ 276. In all these cases the words *both*, *either*, and *in other words*, are no true Conjunctions. They strengthen the Conjunction. The Conjunction, however, exists without them.

§ 277. *Or* and *either* have their corresponding Negatives—*nor* and *neither*. *I will either come or send*

is right. So is *I will neither come nor send.* But *I will neither come or send* is wrong.

§ 278. When a question is either asked or implied, *whether* takes the place of *either*.

Words like *either*, &c., are generally treated as Conjunctions. This, however, they are not. The most that can be said of them is, that they form part of certain Conjunctional expressions. They never stand alone. Meanwhile, the words with which they correspond can, as a general rule, do without them. We say *this or that—mine nor his*, quite as correctly as *either this or that—neither mine nor his.*

If, then, they are not Conjunctions, what are they? *Both* is decidedly a Noun. *Either*, however, *neither* and *whether*, seem to be both Nouns and Adverbs. When *either* means *one out of two*, it is a Pronoun. When it means *in the way of an alternative*, it is an Adverb.

§ 279. Conjunctions which denote the dependence of one act on another are Causal, Illative, Final, and Conditional.

§ 280. Causals give the cause of a given effect.

The day is warm
because
The sun shines.

§ 281. Illatives give the effect of a given cause.

The sun shines,
therefore
The day is warm.

§ 282. Finals give the object for which a given action is effected.

I do this
that
You may follow my example.

§ 283. Conditionals give the conditions on which a given event depends.

The night will be fine
if
The stars shine.

§ 284. Copulatives require Plural, Disjunctives and Subdisjunctives a Singular, Number.

§ 285. When *that* signifies intention, the Verb which follows must be in the same Tense as the Verb which precedes it. (1.) I *do* this *that* I *may* succeed. (2.) I *did* this *that* I *might* succeed.

§ 286. *Conditional* Conjunctions govern the Subjunctive Mood.

§ 287. The chief Conditional Conjunction is *if*. To say *if the sun shines the day will be clear* is inaccurate. The proper expression is, *if the sun shine*, &c.

Although the word *if* is the type and specimen of the Conditional Conjunction, there are several others so closely related to it in meaning as to agree with it in requiring a Subjunctive Mood to follow them.

1. *Except* I be by Silvia in the night,
There is no music in the nightingale.
Two Gentlemen of Verona.

2. Let us go and sacrifice to the Lord our God *lest* he *fall* upon us with pestilence.

3. Let him not go *lest* he die.

4. He shall not eat of the holy thing *unless* he *wash* his flesh with water.

5. *Although* my house *be* not so with God.

6. ——revenge back on itself recoils.
Let it. I reck not *so* it *light* well aimed.

7. Seek out his wickedness *till* thou *find* none.

And so on with *before*, *ere*, *as long as*.

On the other hand, *if* itself is not always conditional, being occasionally equivalent to *since;* in which case it may be followed by an Indicative Mood.

§ 288. *As* follows Adjectives or Adverbs of the Positive Degree, preceded by *so*.—*Be so kind as to come here.*

§ 289. *Than* follows Adjectives and Adverbs of the Comparative Degree.—*This is sharper than that. I see better to-day than yesterday.*

Than, in respect to its Etymology, is neither more nor less than *then*. It is not difficult to see the connection in sense between such sentences as *I like this better than I like that*, and *I like this —then* (*afterwards or next in order*) *I like that.*

§ 290. *Than* is sometimes treated as a Preposition; when it governs a case.

Thou art a girl as much brighter than *her*,
As he is poet sublimer than *me*.—PRIOR.

§ 291. It is better, however, to treat it as a Conjunction; in which case the Noun which follows it depends upon the Verb of the antecedent clause. 1. *I like you better than he* = *I like you better than he likes you.* 2. *I like you better than him* = *I like you better than I like him.*

§ 292. *But*, in respect to its etymology, is *be-utan* = *by-out.* It is not difficult to see the connection in sense between such sentences as *all but one*, and *all without* (or *except*) one.

It is, then, a Preposition, as well as a Conjunction. Its Prepositional construction is—*They all ran away but me*, i. e. *except me.* Its Conjunctional Construction is—*They all ran away but I*, i. e. *but I did not run away.*

§ 293. When two or more Nouns, in the Singular number, are connected by a Preposition, the verb is Singular.

The father, with the son, is coming.

§ 294. When two or more Nouns, in the Singular number, are connected by a Copulative Conjunction, the Verb is Plural—*the father and son are coming.*

§ 295. No Conjunction can govern a case. A word that governs a Case, be it ever so like a Conjunction, is no Conjunction but a Preposition.

Yes and *No* are, perhaps, words sufficiently peculiar to justify us in treating them as a separate Part of Speech: for it may be observed that, unlike any word hitherto noticed, they constitute a whole Proposition by themselves. *Yes* = *it is*, while *no* = *it is not.* At the same time, they depend upon what has preceded, for unless a question has been asked how is an answer to be given? There is nothing to reply to.

§ 296. The Negative follows the Verb unless it be in the Infinitive Mood; in which case it precedes it;—*He spoke not, he moved not, he did not, he could not;* but *not to advance is to retreat; he did not speak, he could not move.*

§ 297. Two Negatives make an Affirmative. *I have not not seen him = I have seen him.*

§ 298. A question to which no answer can be given is much the same as a Negative. A person who, in extreme perplexity, says *what I am to do* really means *I know not what to do.* These are called Questions of Appeal.

§ 299. In all questions there is a transposition of the Terms. In *what is this* the word *what* is the Predicate. Yet it begins the sentence. In *is he at home*, the word *is*, though it begins the sentence, is a *Copula.*

§ 300. When the Copula precedes the Predicate, the question is Categorical, and its answer is *Yes* or *No.* —Question. *Is John at home?* Answer. *Yes* or *no* as the case may be.

§ 301. When the Predicate precedes the Copula the question is indefinite, and the answer may be anything whatever. To *where is John?* we may answer *at home—abroad—in the garden—in London—I do not know—&c., &c.*

PART III.

GENERAL AFFINITIES OF THE ENGLISH LANGUAGE.

The closest affinities of the English are with the languages of Germany; but it by no means follows that the range of the English affinities is thus limited.

The English language has clear and definite affinities with both the Latin and the Greek.

Nevertheless, the Latin and the Greek do not belong to the same division of the same class with the English and German.

On the contrary, the tongues allied to the German form a definite group or division, in a class of considerable magnitude and importance.

And the Latin and Greek form a similar definite group, or division, in that same class.

1. The names of several natural objects, &c., are common to these two groups—viz. the group containing the English and its allied languages, on the one side, and the group containing the Latin and Greek, on the other.

English.	Latin.	Greek.
fire	——	πῦρ
water	——	ὕδωρ
star	ste-lla *	ἀ-στηρ
tree	——	δρῦ-ς
deer †	fer-a	θῆρ
mere	mar-e	——
wind	vent-us	——
ligh-t	luc-s (lux)	——
nigh-t	noc-s (*noc-t-is*)	——
snow	nic-s (nix) ‡	νίφ-ος
horn	corn-u	κίρ-ας
egg	ov-um	ὠ ὸν
hide	cut-is	——
day	di-es	——
worm	verm-is	——
fish	pisc-is	——

* A diminutive for *ster-ul-a*.

† As in—

> " Rats and mice, and such small *deer*,
> Have been Tom's food for many a year."
>
> *King Lear*.

‡ The probable Latin root is *sniv-*; the *-s* being lost, and the *v* being the *v* of *niv-is*.

English.	Latin.	Greek.
haulm	calam-us	κάλαμ-ος
folk	vulg-us	——
ewe	ov-is	ὄις
cat	cat-ul-us	——
whelp	vulp-es	——
hound	can-is	κύων
flea	pulec-s (pulex)	——
kid	hæd-us	——
ore	æs (ær-is)	——
father	pater	πάτηρ
mother	mater	μήτηρ
brother	frater	——
head *	caput	κεφ-αλὴ
brow	fr-ons	ὀ-φρὺ-ς
eye †	oc-ulus	——
ear	aur-is	——
nose	nas-us	——
lip	lab-ium	——
mouth	ment-um	——
tooth	den-s	——
tongue	lingua (dingua)	——
knee	genu	γόν-υ
heel	cal-x	——
red	rut-ilus	ἐ-ρυθ-ρος
yellow	gilv-us	——
cold	gelid-us	——
full	pl-enus	πλέ-ος
long	long-us	——
short	curt-us	——
thin	ten-uis	——
young	juven-is	——
flow	fluo	——
blow	flo	——
drag	trah-o	——
break	frang-o (freg-i)	——
brook ‡	fru-or(fruc-tus)	——
bear	fer-o	φέρ-ω
eat	ed-o	——
dare	——	θαρ-σέ-ω
will	vol-o	βούλ-ομαι
stand	sto	ἵ-στη-μι
wit §	vid-eo	εἶδ-ω
a-m	su-m	εἰ-μί
b-e	fu-i	φύ-ω
one	un-us	εἷς (ἑν-ὸς)

* In German *haupt*. † In German *auge*; A.S. *éage*. ‡ See note, p. 125.
§ Meaning *know*, as in *I wist not*—*Middlesex to wit*.

English.	Latin.	Greek.
two	duo	δύ
three	tria	τρία
six	sex	ἕξ
seven	septem	ἑπτὰ
eight	octo	ὀκτὼ
nine	novem	ἐννία

The affinities of *four*, *five*, and *ten*, with *quatuor*, *quinque*, and *decem*, are not less real than those of *one* and *three* with *un-us*, *tria*, &c. The intermediate forms, however, such as πίμπτος in Æolic Greek, and *fimf* in Mœso-Gothic (=*five*), are only found in the allied languages and dialects; so that the verification of the identity of these numerals would be somewhat elaborate.

Instances like those which have just been under notice are instances of *glossarial* affinity, because the likeness consists in the likeness between individual words (γλῶσσαι).

What follow are instances of what is called *grammatical* affinity, because the likeness consists in the likeness between *the inflections*.

The *-s* in the English genitive singular (*father's*) is the *-s* in patr-*is*, lapid-*is*, &c., which is the *-s* in πάτερ-ος, τίτᾶν-ος, &c.

The notion that *father's* is an abbreviation of *father his*, is erroneous. It is based upon expressions like *Christ his sake*, and others, which occur in the Bible translation, the Liturgy, and other portions of our older literature. This view will not account for expressions like *the Queen-s grace*, *the children-s bread*, since they cannot possibly be explained by being derived from the *Queen her grace*, or the *children their bread*.

Again—the view in question will not account for the *-s* in the word *hi-s* itself.

2. The *-s* in the English nominative plural (*fathers*) is the *-s* in *lapide-s*, τίτᾶν ες.

3. The *-er* in the English Comparative degree (*wiser*) is the *-er* in words like *inf-er-us*, *sup-er-us*.

4. The *-st* in the English Superlative (*wis-est*) is the *-ιστ* in words like εἴκτ-ιστ-ος.

5. The *-m* in *for-m-er* is the *-m* in *pri-m-us*.

6. The *-t* in *tha-t* and *wha-t* is the *-d* in *i-d*, and the *-τ* in ὅ τ-ι.

7. The *-th* in words like *four th* and *fif-th* is the *-t* in *quar-t-us*, and *quin-t-us*, τίτταρ-τ-ος, πίμπ-τ-ος.

8. The *-m* in *a-m*, is the *-m* in *sum*, and εἰ-μ-ί.

9. The *-s* in *call-es-t* is the *-s* in *am-as*, and τύπτ-εις. The *-t* is of late origin. It was unknown in the Mœso-Gothic, and in the Old-Saxon, where the termination is simply *-s*.

10. The *-th* in *speak-eth* is the *-t* in *am-at*.

11. The *-ing* in *speak-ing*, is the *-nd* of the Latin Gerunds, *ama-nd-i*, *ama-nd-o*, *ama-nd-um*. The older form of the Eng-

lish participle was *-nd*. In A. S. *luf-i-and* was the participle. This termination has since been softened down into *-ing*.

12. The first *d* in *did*, as has been stated elsewhere, is believed on good grounds to be as true a reduplication as the *σ* in *σί-συφα*, and the *m* in *mo-mordi*.

13. The *-d* in the participle *moved* is probably the *-t* in *voc-at-us*, and the *-θ* in *συφ-θ-ίς*. I say *probably*, because there are two doctrines concerning it. Grimm considers that it is the *d* in *did*, the reduplicate Preterite of *do*. In the Plural Preterite of the Mœso-Gothic this *d* appears *twice;* so that we have the termination *dêdum; as nas-idêdum, nas-idêduþ, nasidêdun*, from *nas-ja; sok-idêdum, sôk-idêduþ, sôk-idêdun*, from *sôk-ja; salb-ôdêdum, salb-ôdêduþ, sâlb-ôdêdun*, from *salbô*. The same takes place with the Dual form *salb-ôdêduts*, and with the Subjunctive forms, *salb-ôdêdjâu, salb-ôdêduts*, &c. On the other hand, the languages akin to the Russian and Polish present us with a preterite undoubtedly growing out of the *Participle;* so much so that it has Genders. In other words, there is one form for speaking of a past action when done by a male, and another for speaking of a past action when done by a female: just as if, instead of saying *ille amavit*, the Latins said *ille amatus*, whilst, instead of saying *illa amavit*, they said *illa amata*.

TRANSITION OF LETTERS.

Certain sounds in Latin or Greek are changed into certain other sounds in the languages akin to the English tongues with remarkable regularity. The most important of these are the transitions of—

1. *An initial* Π *or P.*

This, in Greek and Latin, becomes *f* in English.

Greek.	Latin.	English.
πατὴρ	pater	father
πλίος	pl-enus	full.

2. *An initial* Φ *or F.*

This, in Greek and Latin, becomes *b* in English.

Greek.	Latin.	English.
φέρ-ω	fer-o	bear
———	fruc-tus *	brook
———	freg-i †	break.

* The root of *fru-or*. The English word *brook*, as in expressions like *I could not brook such treatment*, means originally *to make the most of*, or *use*. *Brauchen* = *use* in the present German.

† This is a simpler form than the present *frango*.

3. *The initial* K *or C.*

This, in Greek or Latin, becomes *h* in English.

Greek.	Latin.	English.
κεφ αλὴ	caput	head *
καρδ ία	cord-is	heart.

4. *The initial* Γ *or G.*

This, in Greek or Latin, becomes *k* in English.

Greek.	Latin.	English.
γνώ-ω	gno-sco	know
γέν-ος	gen-us	kin.

5. *The initial* Θ, *or TH.*

This in Greek becomes *f* in Latin, and *d* in English.

Greek.	Latin.	English.
θύρ-α	for-a	door
θυγάτηρ	——	daughter.

The languages akin to the Russian, Polish, and Bohemian, along with the Lithuanian of Lithuania, the Lett of Livonia and Courland, and the original language of East and West Prussia, form a class by themselves—a class, however, which, like the one which contains the Latin and Greek, is allied to the class which contains the English and German, &c. It is no part of the present work to go into the details of these affinities. It is only stated that such exist. The same classes of words present the same similarities. The grammatical affinities are also of the same nature. The letter-changes are equally regular—though the details are different. Thus the third of the preceding lists (that from *k* or *c* to *h*) gives us, for the languages in question, *s*.

English.	Latin.	Greek.	Lithuanic.
*h*aulm	calamus	κάλαμος	salms
*h*eart	cord-is	καρδία	szirdis
*h*ound	can-is	κύ ων	szuns.

This shows that the regularity of letter-changes is extended over as many as three large and important philological groups.

With the Keltic group of tongues, *i. e.* with the languages akin to the Welsh and Irish Gaelic, the English has also certain affinities. They are less close, however, than those with the families already noticed.

* In German *haup-t*.

APPENDIX.

Anglo-Norman Extract.

(Page 11.)

Translation literal.

One day was Charlemagne at St. Denis' minster,
Had taken his crown, in-cross marked (*signed*) his head,
And had girt his sword ; the hilt was of gold pure (*mere*),
Dukes there he had, and lords (*domines* or *dons*), and barons, and cavaliers,
The emperor looked-at (*regarded*) the queen his wife ;
She was well-crowned, at the most beautiful and at the best.

Latin.

Unum diurnum fuit Carolus, ad illud Sancti Dionysii monasterium,

Re-habebat prehensam suam coronam, in cruce signatum suum caput,

Et habebat cinctam suam spadam ; ille pugnus fuit de auro mero,

Duces ibi habebat, et dominos, et barones, et caballarios,

Ille imperator contemplatus est illam reginam suam mulierem ;

Illa fuit bene coronata ad plus bellum et ad melius.

*** *This should be translated into Modern French, and then compared with the Anglo-Norman.*

Semi-Saxon Extract.

(Page 12.)

Translation literal.

Bladud had a son,
Lear was hight ;
After his father's days
He held his liege land
Together on (through) his life,
Sixty winters.

Bladud had a son
Lear was hight
After his father he held the land
In his own hand
Through his life-days
Sixty winters.

He made a rich borough	He made a rich borough
Through his wise craft	Through wise men's counsel
And he it let name	And he let it name
After himself.	After himself.
Caer Lear hight the burgh,	Caer Lear hight the borough,
Dear was it to the king.	Dear was it to the king.
Which we on our language	Which we on our speech
Leicester call	Leicester call
Of yore on the old days.	In the old days.

Old-Saxon Extracts.

(Page 18.)

Hear God bidding mine; and not fore-warp (reject) biddings mine; think to me; and hear me.

Saddened be (I) on toil mine; and mistrust be (I) from voice enemies' (fiends), and from labour (of the) sinful.

When then they charged on me unright, and on rage unsweet were (to) me.

Heart mine is troubled on me, and fright deaths' fell over me.

Fright and trembling came over me, and decked (covered) me darkness.

And I quoth, who shall give me feathers al-so-as (of a) dove; and I flee shall, and rest shall.

The same in Dutch (from the *Taalkundig Magazin*).

Hoor, God! mijn gebed, en verwerp niet mijne bede! denk tot (aan) mij, en hoor mi.

Ontroerd ben ik en mijne bezigheheden en misstrootig ben ik van de stem des vijands en van het leed (mij) van den zondigen (aangedaan).

Want zij neigden op mijhet onreght, en in verbolgenheid waren zij mij onzoet.

Mijn hart is ontroerd in mij, en de vries des doods overviel mij.

Vries en beving kwamen over mij en duisternis dedeckte mi.

En ik zeide, wie zal mij geven vederen als van eene duif; en ik sal vliegen en zal rusten.

Frisian Extract.

(Page 18.)

That is the third determination and concession of King Charles, that of all men each one possess his own goods (house?) unrobbed. It may not be that any man overcome him with charge (tales), and with summons (rede), and with legal action. So let him hold as his Asega (judge) dooms and deals according to the land-right of the people. There shall no Asega deal a doom unless it be that before the Cæsar of Rome he shall have sworn, and that he shall have been by the people chosen. He has then to doom and deal

to foes as to friends, through the force (will) of the oath which he before the Cæsar of Rome has sworn, to doom and to deal to widows and orphans, to wayfarers and all defenceless people, to help them as his own kind in the third degree. If the Asega take an illegal reward, or pledged money, and a man convict him before two of his colleagues in the King's Court, he has no more to doom, since it is the Asega that betokens the priest, and they are seeing, and they should be the eyes of the Holy Christendom, they should help all those who may nought help themselves.

Modern German Extract.

(Page 20.)

As Hercules in the Heaven up-taken was, made he his greeting, under (among) all Gods, to Juno at (to) first. The whole Heaven and Juno were astonished thereon (over). "Thy female enemy (fiend)," cried they him to, "meetest thou so preferably?" "Yes, herself," answered Hercules, "only her persecutions are it, which me to the deeds opportunity (have) given, wherewith I the Heaven earned have."

The Olympus approved the answer of the new God, and Juno was reconciled.

(Page 21.)

The lines that follow are a translation of the song in Cymbeline:

Hark! the lark at Heaven's gate sings;
The sun begins to rise:
His steed to water at those springs,
On chaliced flowers that lies.
And winking Mary-buds begin
To ope their golden eyes;
And everything that pretty bin;
My Ladye sweet arise,
Arise,
My Ladye sweet arise.

(*Literally.*)

Hark! Hark! the lark at Heaven's door sings,
The dear (*love*) Sun wakes up;
Out of all bloom-chalices drinks
She (the *sun*, which is feminine) already their offering up
The batchelor's button friendly looks.
And does its eye-ling up (= opens little eye).
What gracious and dear is friendly winks,
Wake, fair child, wake up.
Wake up, &c.

Mœso-Gothic.

(Page 22.)

Anastodeins, beginning, lit., up-standing—*ga-meliþ*, written, painted, German, *mahlen* = *paint.* The *ga* is the sign of the participle; one word in English preserves it, viz. y-*clept* = *called;* A. S. *clepian* = *to call*—*aggilu*, ἄγγιλος—*gamanveiþ*, prepare—*stibna*, voice; German, *stimme*—*vopjandins*, crying; weep-ing—*auþidai*, Germ. *öde* = *waste.*—*Fanins*, of the Lord, one of the many Slavonic words in Ulphilas = *Pan* = *dominus*—*staigos*, ways = German, *steig;* Danish, *stie* = *way* —*daupjands*, baptize = *dip*—*merjands*, proclaiming, preaching—*idreigos*, repentance. This has been looked upon as a Keltic word *aflageina*, away-laying; —*fravaurhtê*, of sins; *fore*works; the *fore*, as in *for*swear—*usiddjedun*, out-goed, out-yode—*awai*, water, river; *aha*, Old German, *aa*, Norse—*andhaitandans; and* = *coram*, *hait* = *voco*, as in *hight* = *is called*, *bears the name:* = *proclaiming*, *confessing; gavasiþs*, clothed; from *vasjan* = *to clothe*—*taglam*, hair, (word for word); *tail*, *tægel*, A. S.--*ulbandaus* (word for word) *elephant*—*gairda filleina*—fell (as in *fell*-monger), girdle—*hup*, hips—*þramsteins*, twigs (such the translation, not *grasshoppers*) —*mileþ haiþivisk*, heath-honey; *qipands*, saying (*queathing*, as in *quoth*, *bequeathe*)—*swinþoza*, stronger, A. S. *swiðe* = *very.* Comparative in *z* (s). *Sa*, who; *anahneivands*, stooping, bending (*kneeling*);—*skauda-raip*, latchet; *izvis*, you; *vatin*, *water;* Lithuanic, *wandu;* Danish, *vand;* Swedish, *vatn; ahmen*, spirit; *veihamma*, holy.

Danish Extract.

(Page 22.)

King Christian stood by high-*the* mast,
In reek and damp,
His weapon hammered so fast
That Gothland's helms and brains burst;
Then sank each hostile (fiendlike) stern and mast
In reek and damp.
Fly shrieked they, fly, what fly can:
Who stands against Denmark's Christian
In battle?

Niel Juel gave heed on storms-*the* crash,
Now is it time.
He hoist the red flag,
Eke slew on fiend-*the* blow on blow,
Then shrieked they high amid storms-*the* crash,
Now is it time,
Fly shrieked they who knows a shelter:
Who can stand against Denmark's Juel
In fight?

O North-sea! flash of Vessel broke
Thy murky cloud (sky):
Then took refuge warriors (*champions*) in thy bosom;
For with him flashed fright and death.
From battle-fields, heard-*was* cry which broke,
Thy thick cloud (sky).
From Denmark flashes Tordenskiold!
Each give himself in Heaven's power (wealding)
And fly.

Thou Dane's way to glory and might,
Dark Sea!
Accept (*take in meeting*) thy friend, who reckless
Dare meet danger with contempt,
So proud as thou, against storms-*the* might,
Dark Sea!
And swift through noise and music,
And fight and victory bear me to (*til*)
My grave.

Norwegian National Song.

(Page 23.)

Freedom's temple in the Normans-the dales
Stands so noble in lea of his rock (fell)
Free dares he think, and free dares he speak,
Free dares he work til Norway's weal.
Bird (*fowl*)-the in wood (*shaw*)-*the*,
North-sea's-*the* wave-*the*
Freer not is than Norway's man;
Willing, however, obeys he self-given laws
True fast towards king and fatherland.

Loved land with the sky-high hills (bergs),
Fruitful valleys, and fish-rich coast,
Truth and love glad we for thee swear;
Callest thou, bleed we for thee with pleasure.
Ever thou stand
Loved amongst lands,
Free as the storm that roars round thy fell;
And (eke) whilst billow-the laps round thy strand,
Ever thou wax in praise and wealfare.

Swedish Extract.

(Page 24.)

From Frithiof's Saga.

King Ring he sat in high-bench at Yule (*Christmas*) eke drank mead,
By him sat his queen so white and rosy-red.

As Spring and Autumn (*harvest*) them both man saw aside-by
each other,
She was the fresh spring, the chill harvest was he.

Then trod out-in hall-*the* an unknown (*unkenned*) old-man in;
From head and (*eke*) to feet he covered was in skin;
He had staf in hand-*the*, eke bent was-seen he (to) go,
But higher than the others the old-man was still.

He sat-him on bench-*the* along below by halls-*the* door;
There is the poor's place (*stall*) still-now, as that was before.
The court-men laughed scornful, and saw till each-other;
And pointed with finger-*the* at ragged bear-skin man.

Then flashes with two eyes the stranger so sharp,
With one hand he griped a young-swain in haste.
Right (*whole*) he turned the court-man up and down (*nether*),
Then kept silent the others; we had done (*gar* Scoticé) with
(also).

Icelandic Extract.

(Page 25.)

From the Edda.

Up rose Odin,
Of men king;
Eke he on Sleipner
Saddle on-laid.
Rode he nether-wards thence
Nifhelja til;
Met he the whelp;
Which out of hell came.

He was bloody
On breast in front;
Eke at the spell's father
Barked long.
Forward rode Odin
The fieldway dinned:
He came at the high
Hell's house.

This is one of the Norse poems, translated by Gray.

Up rose the king of men with speed,
And saddled strait his coal-black steed, &c.

The Danish, Swedish, and Icelandic place the definite article at the end of the word it agrees with. Hence *storm* = *storm*, storm-*en* = *the* storm (storm-*the*).

Again, the same languages have a true passive voice. Hence *höre* = *hear*, (*höre-s* = *is heard*,) *hörte* = *heard*, *hörte-s*, *was heard* (*heard-was*).

Extract from the Ormulum.

(Page 34.)

And whoso whilom (*some time or other*) shall this book
After other time write ;
Him bid (*pray*) I that (he) it write right,
So as (*sore*) this book him teacheth :
Although (all *athwarth*) out after that it is
Upon the first example,
With all such (*so-like*) rhyme as here is set,
With also many words :
That he look well that he
One letter (*book-staff*) write twice,
Each-where that it upon the book
Is written on that wise ;
Look he well that (*he*) it write so,
For he may nought else,
On English write right to word :
That wit (*he*) well to (*for-*) sooth.

Woodfall and Kinder, Printers, Angel Court, Skinner Street, London.

ELEMENTS

OF

COMPARATIVE PHILOLOGY.

ELEMENTS

OF

COMPARATIVE PHILOLOGY

BY

R. G. LATHAM, M.A., M.D., F.R.S., &c.,

LATE FELLOW OF KING'S COLLEGE, CAMBRIDGE; AND LATE PROFESSOR OF ENGLISH IN UNIVERSITY COLLEGE, LONDON.

HIS IMPERIAL HIGHNESS

THE PRINCE LOUIS LUCIEN BONAPARTE,

EMINENT FOR THE ZEAL AND EFFICIENCY

WITH WHICH HE HAS CONTRIBUTED TO OUR KNOWLEDGE OF

SOME OF THE MOST IMPORTANT BRANCHES OF

COMPARATIVE PHILOLOGY,

AS WELL AS IN RECOGNITION OF MUCH SPECIAL INFORMATION, FREELY

IMPARTED,

The following Pages are Inscribed.

LONDON,

June 4th, 1862.

PREFACE.

THE object of the present work is to lay before the reader the chief facts and the chief trains of reasoning in Comparative Philology.

This last term is by no means unexceptionable. It has the merit, however, of being in general use, and it conveys no notions which materially mislead even the most uncritical. Neither is it, by any means, an easy matter to supersede it by one which shall be exactly adequate to the subject. Those which have suggested themselves to the present writer or to others convey either too much or too little.

That such a work is wanted is known to every student. Since the publication of the Mithridates, no work equally extensive and systematic has appeared: nor has the Mithridates itself been re-edited with the proper annotations or additions.

The main mass of facts lies in the details of the languages themselves. Of these details, the ones which best suit a general exposition are the actual enumeration of the existing forms of speech and the phenomena connected with their distribution over the earth's surface; the phenomena of their distribution, taken by themselves, being of great importance and interest. In some respects they are ethnological rather than philological in the strictest sense of the term. They

must, however, be known before even the rudiments of the subject can be studied; and it is plain that they must be known in their integrity. Any important omission would damage the systematic exhibition of the whole. There is no language which does not illustrate some other; and the least that is required of any general investigator is that he should know the details of his subject-matter—not some, but all.

I notice this, because the purely descriptive portion of the work fills more than six-sevenths of the volume; and has the appearance of starving the remainder. A larger work would have removed this disproportion. Still, with languages and dialects as numerous as they are, the preliminary exposition must be accommodated to the multiplicity of its details. In some cases, no doubt, space might have been saved. In languages, however, which are either known from only a single specimen or are on the verge of extinction I have given more than I should have done otherwise.

The words which are selected as samples are not chosen on *à priori* principles. This means that I have not assumed that the names of certain parts of the body, of the sun, moon, &c., are the oldest and most permanent parts of a language without an approach to something like a preliminary trial. I have not assumed beforehand that they are what is sometimes called words of primary necessity. On the contrary, I have actually tried by the comparison of allied languages what words are the most permanent. It is only, however, where the materials were sufficient that I could thus pick and choose. In many cases, especially with the languages of South America, I have been fain to take what I could find.

I must also add, that the short lists of the present work are not intended to represent the evidence upon which the affinities between the languages which they illustrate is founded. For this they are insufficient. They

are rather meant as simple examples. Still, even as evidence, they are valid so far as they show likeness. A few words are enough for this. To predicate difference a greater number is required. It follows, however, from the fact of their being the words which are conspicuous for their permanence, that, as a general rule, languages, when taken altogether, are *less* alike than a list of selected words makes them.

Failing to find a vocabulary, I have occasionally given a Paternoster as an illustration; and here the converse is the case. Languages, as a general rule, are *more* alike than the comparison of their Paternosters suggests.

As for the words themselves, I am, for an inordinately large proportion of them, simply under the guidance of my authorities: indeed, many forms of speech are known only from a single specimen, often the contribution of an imperfect investigator. Upon the whole, however, I have found that they are sufficient for the purpose. At any rate, inaccurate specimens conceal, rather than exaggerate, affinities.

The several groups, or classes, as given in the classification of the present volume, so far as they depart from the ones in general currency, may be divided into three classes.

1. The first contains those where the *minimum* amount of positive evidence is required. Here, the criticism deals with the real presumptions in favour of my own view as opposed to those against it. This means little more than the expression of an opinion that the current doctrine is, in itself, improbable; that the *onus probandi* lies with those who assert, rather than with those who decline to admit, it; and that, on the part of those with whom the *onus* lies, the case has not been made. It is clear that this is a criticism of the common grounds of assent rather than a matter of philological fact.

2. The second contains those members which have the probabilities on their side, but which, from want of *data*, are susceptible of having their position improved, if not absolutely altered, when our knowledge increases. The South-American languages especially belong to this division. There is some evidence in favour of their being what they are here made; but that evidence is sufficient only because it coincides with the *à priori* presumptions.

3. The third class (and this more especially applies to the speculations on the original extent of the Slavonic and Lithuanian languages) is not only opposed to common opinion but has no presumptions in its favour —except, of course, such as show themselves when the fact is known, and which are, really, no true presumptions at all. It is the intention of the author, if opportunities permit, to mend the evidence on these points.

The second part, or the part which treats of language in general, is short. This arises (as aforesaid) from the great amount of preliminary detail which was absolutely necessary. The notice, however, short as it is, goes at once, to the two main problems, the origin of inflections and the origin of roots. Of the ground covered by these questions it only gives a general view, along with a few suggestions as to the method by which it is to be explored.

What now follows is the qualification of an expression which will frequently occur, and one which, without explanation, may seem to savour of arrogance. I often allude to what I call *the current opinion;* and I generally do so to condemn it.

The notice, however, does not mean that all the world is wrong, and that it is the mission of the present inquirer to set it right. *Current opinion* merely means the doctrine laid down in partial treatises, popular works, and other productions, which either fail to give a sufficiently general view of the subject, or are taken

from second-hand, or third-hand sources; the doctrine of laymen, amateurs, and speculators, rather than professed philologues, responsible authorities, and cautious critics. With many of these latter, I unwillingly differ. Still, wherever I consider myself right, I give every one else the credit of being so, who, with a first-hand knowledge of the subject, has not committed himself to any of the notions I have objected to.

The same principle is extended to what may be called *discoveries*. As a general rule, they belong so thoroughly to the domain of common-sense, that, with a scientific method, they come of themselves, and, so doing, carry with them but slight claims for bold originality and the like heroic qualities. Where I am right in any view not generally received, I am, unless the contrary be expressly stated, an independent witness: and, in claiming this for myself, I award the same merit (such as it is) to others. Where the line of inquiry lies in a right direction, any amount of similar results may be obtained by independent investigators; and that many good results are actually thus obtained is certain. Philological papers are spread over such a vast variety of periodicals, monographs, and different works in different languages, that the mere search for them is a matter of time and labour—to which favourable opportunities must be added. If, then, I pass over many important observations without special reference to the observer, I do it without, at all, implying that my own are either the only or the earliest ones. I often find them in other writers; but I have never encouraged the notion that they were borrowed. A like liberal construction is what I ask from others. The history of the opinions connected with any department of knowledge is one thing; the investigation of the facts themselves is another; and, in proportion as any branch of knowledge advances, agreement independent of communication increases.

CONTENTS.

CHAPTER I.

PAGE

Dialects and Languages.—Stages of Languages.—General Distribution.—Large, Small, and Medium Areas.—Insular and Continental Distribution.—Obliteration of Intermediate Forms.—Classification by Type and Definition.—General View of Seven Great Divisions.—The Class Natural 1

TABULAR VIEW

OF

LANGUAGES AND DIALECTS.

FIRST PRIMARY GROUP.

Tibetan and Burmese.

Tibetan.

Bultistani of Little Tibet—Ladakhi, Tibetan—written (*or older*); spoken (*or newer*)—Butani or Lhopa (*divisions chiefly political*)—Changlo.

Bhot of Kunawer. Milchan—Theburskud—Súmchú.

Serpa (*details doubtful*). Thaksya—Sunwar.

Eastern Bhot (*transitional to Burmese*). Takpa — Manyak — Thochu—Gyami.

Northern Bhot. Hor.

Nepalese.

(*a*) Gurung—Murmi; (*b*) Magar—Bramhú; (*c*) Chepang—Váyú—Kusunda (*Nepalese leading to Northern India*); (*d*) Newar—Pahri (*do.*); (*e*) Kirata—Limbu (*do.*); (*f*) Lepcha (*leading to Asam*); (*g*) Dhimal—Bodo—Borro—Garo (*leading to Singpho through Jili*).

Asam, &c.

Dofla, Abor, and Aka. Miri (*on the northern frontier*); Angami (*Naga, so-called, on the southern*).

Tayung and Mijhu Dialects (*languages*) of the Mishmi.

(?) Deoria Chutia.

Manipur, &c.

Kasia. Mikir.

Jili (*running westward through the Garo*)—Singpho—Kakhyen.

Naga Dialects (*so-called*) *minus* the Angami (*see above*) and the Mithan (*Singpho or transitional*)—numerous.

Koreng—Songpu—Luhuppa—North Tankhul—Khoibu—Maring—Kapwi—Maram—Manipur.

Kuki and Luncta—Mru—Kami and Kumi—Sak—Shendu—Khyen.

Rukheng (Arakan)—Burmese Proper.

Sgau—Pwo—Thoung-lhù.

Siamese.

Ahom—Khamti—Shan—Laos—Siamese Proper—Palaoung.

Môn.

Mon of Pegu—Kha—Khong of Kambojia.

Islands.

(?) Andaman.
(?) Carnicobar.

Chinese and Cochinchinese.

Anam of Cochinchina and Tonkín.
Chinese.

SECOND PRIMARY GROUP (TURANIAN).

Tungus—Mongol—Turk.

(?) Yeniseian. 1. Northern Branch of the Sim and the Pit, &c. 2. Southern Branch—Assan—(*extinct*) Arini—(*extinct*) Kot.

(?) Tshuvash.

(?) Yukahiri.

Ugrian.

Samoyed. *South-eastern;* Motorian (*extinct*) — Koibal (*do.*) — Kamass. *South-western* (*Ostiak, improperly so-called*)—*Northern;* Yeniseian—Tawgi —Yurak.

Ostiak—Vogul—Hungarian (Magyar).

Mordvin—Tsherimis—Votiak.

Permian and Zirianian—Karelian—Tavastrian and Quain—Fin—Vod—Estonian—Lief.

Lap.

Peninsular.

Korean.

Japanese—Lúchú.

Aino of Sagalín—of Kuriles—Kamtshatka.

Gilyak (?) Koriak—Kamtshatkan (*leading through the Aleutian to the Eskimo*).

THIRD PRIMARY GROUP.

Indian.

(1.)

Languages with the Sanskrit element not sufficiently large to make their origin disputed.

Denwar and Darahi—Tharu—Kuswar—Pakhya—Kooch.

Ho (Kol) of Singbhum—Suntal, &c.

Khond—Gadaba—Yerukali—Savara (more Kol than the others though further South) &c.—leading to Telugu.

Ghond.

Uraon—Rajmahal.

Telinga or Telugu—Tamul—Malayalim—Canarese—Tuda—Budugar—Irular—Kohatar—Kodagu or Curgi—Tulava.

Brahui.

Cant languages, and languages of migratory Indian Tribes.

Thug—Bagwan—Taremuki—Korawi—Ramusi—Mang—Nut—Katodi—Bowri—Guhuri—Gypsy. Khurbat and Duman of Persia; Ghager, Helebi, and Nawer of Egypt, &c.

(2.)

With a proportion of Sanskrit sufficiently large to make their origin disputed.

Cashmirian—Hindí—Punjabi, &c., and Bengali of Asam—as spoken in Arakan—Uriya (Udiya)—Gujerati—Cutch (*leading to Sind*)—Sindhi = Siraiki—Lar—Marathi (Mahratta)— Konkani.

Singalese—Rodiya—Maldive.

* * * * * * *

Swauti—Shina—Dir—Tirhai.

Kashkari (Dard)—Arniya—Kashkari—Chitrali.

Kaferistani—Siaposh.

Cohistani—Lughman—Pushai.

(?) Kajunah.

Persian.

Pushtu Patan, or Affghan; eastern and western—Biluch—Persian (*general language*)—dialects of Tajiks out of Persia, Baraki, &c.—Kurd.

(?) Iron.

Dioscurian.

Armenian.

Georgian. Kartulinian—Mingrelian and Imeretian—Suanetian—Lazistani.

Tushi—Ingúsh—Tshetsh.

Kabardinian—Tserkess Proper.

Adigé. Abchazi—Tepanta.

Avar—Anzukh—Tsari—Andi, &c.—Dido and Unso—Akush—Kasikumuk—Kurali.

FOURTH PRIMARY GROUP (OCEANIC).

Malay, &c.

Samang of Juru of Kedah.

Silong—Nicobar.

Malay (general language)—Tshamba—Jakun—Atshin—Singkal—Pakpak Toba and Banjak Batta—Korinchi—Rejang—Lampong (*with Javanese ele-*

ments)—Ulu—Lubu (*unlettered*)—Nias—Maruwi—Poggi, or Mantawa, Islands—Enganho (*outlying*)—Sunda—Madura—Sumenap—Javanese—Bali—Sasak—Bima—Sumbawa—Timbora—Ende—Mangarei (*one of the first languages of the series in which Australian words were observed*)—Ombay (*see Mangarei*)—Solor—Savu—Roth—Timur—Manatoto—Timorlaut—Kissi—Baba (Bebber)—Key Doulan—Wokan, &c.

Borneo—Parts about Labuan—Banjermassin—Kayan of Centre—Northern districts.

Celebes. Bugis—Mandhar—Macassar—Menadu (*dialects numerous*)—Gunong-Tellu—Buton—Amboyna—Saparua—Ternati—Tidor—Ceram—Halmahera or Gilolo.

Sulu—Bissayan—Iloco—Cayagan—Tagala—Umiray—Dumagat, &c.—Bashi.

Formosan = Sideia and Favorlang.

Micronesia.

Tobi—Pelews—Guaham—Chamor—Ulea—Yap—Satawal.

Mille—Tarawan—Fakaafo and Vaitupu.

Polynesia.

Samoan (*Navigators' Isle*)—Marquesas—Kanaka (*Sandwich Isles*)—Tonga—Tahitian—Paumotu—Maori—Easter Island—Wahitao—Mayorga—Ticopia—Cocos Island—Rotuma.

Papuan.

Guebe—Waigiu—Parts about Port Dorey—Lobo—Utanata—Mairassis—Triton Bay—Onin—Miriam—Redscar Bay and Dufaure Islands—New Ireland and Port Praslin—Bauro and Guadalcanar—Vanikoro—Tanema and Taneama—Mallicollo—Tanna—Annatom—Erromango—Lifu and Mare—Baladea—Dauru.

Fiji.

Australian.

Cape York—Massied—Kowrarega and Gudang—Moreton Bay—Sidney—Muruya—Peel—Bathurst—Mudji—Kamilaroi (Wellington)—Wiradurei—Lake Macquarie—Witouro—Woddowrong—Koligon—Jhongwhorong—Gnurellean—Corio—Coliak—Lake Hindmarsh—Pinegorine—Dautgart—Lake Mundy—Molonglo—Boraiper—Yakkumban—Aiawong—Parnkalla—Head of Bight—W. Australia—Port Philip—King George's Sound, &c.

Tasmanian—Eastern, Western, Northern and Southern dialects.

FIFTH PRIMARY GROUP (AMERICAN).

Aleutian.

Kadiak—Kuskutshewak—Tstu-gatsi—Labrador, Greenlandic—Namollo.

Athabaskan.

Kenay—Kutshin (Loucheux)—Dog-rib, Slave, Beaver, Chepewyan Proper, Takulli—Tsikanni—Sussi.

Atna—Koltshani—Ugalents.
Tlatskanai—Umkwa—Kwaliokwa.
Navaho—Húpa—Apatsh—Pinalero—Jecorilla.

Oregon.

Kitunaha.

COMPARATIVE PHILOLOGY.

CHAPTER I.

Dialects and Languages.—Stages of Languages.—General Distribution.—Large, Small, and Medium Areas.—Insular and Continental Distribution.—Obliteration of Intermediate Forms.—Classification by Type and Definition.—General View of Seven Great Divisions.—The Class Natural.

THERE are slight differences of speech between members of the same family. Between different villages and towns they increase, and they become greater still, when there is a difference of tribe, clan, or nationality. What this difference consists in varies with the circumstance of the case. It may be a difference of words, or it may be a difference of pronunciation. Let a Scotchman, an Irishman, and an Englishman, utter a series of sentences, consisting of exactly the same words, and a difference of some kind or other will be the result—a difference which some may call a difference of tone, others, one of accent; a difference for which the name may be doubtful; but, at the same time, a difference which would make the speeches, if heard at a distance too great to allow the exact words to be heard, look like speeches in three different languages.

When differences of this kind reach a certain point, they constitute *dialects;* and when two forms of speech differ so much as to be mutually unintelligible the result is two different *languages.* Such, at least, is the rule in a

rough form. I say *in a rough form*, because both *dialect* and *language* are vernacular, rather than technical, terms; terms, which, in some cases, mean less than in others; terms of which no exact definition has been given. Nor is it recommended. On the contrary, latitude must be allowed. So much depends upon the nature of the subject spoken about, and so much on the aptitude of the individuals speaking, that it is difficult to say when mutual unintelligibility begins. Two dull men from different parts of the same country may be puzzled over an out-of-the-way proposition, where a quick wit, with a simple question, would make easy work of things. When we talk of two dialects being either mutually unintelligible, or the contrary, we should think of this. The dialect itself is but one point. The speaker gives us another: the subject under speech the third.

Sooner or later, however, the line of mutual intelligibility is passed, whether for quick ears or slow, whether for simple questions or complex ones; and then we have, under all conditions, a change of language. Many a language, however, is little more than a dialect, with its dignity augmented through certain extreme circumstances. Its alphabet (for instance) may be peculiar. It may represent a different nationality. Its culture may be independent. A Dane and a Swede can understand each other; but the Danish can no more be called a dialect of the Swedish, than the Swedish can be called a dialect of the Danish.

It is safe, however, to consider such forms of speech as are, in *all* cases, mutually unintelligible as different languages; and it would be scientific to treat each such language as a philological unit, of which the dialects and subdialects are the fractions. I say that this would be scientific; but I do not say that it would be convenient, or, in all cases, practicable. We cannot, as has just been stated, call such forms of speech as the Danish and Swedish *dialects:* nor yet the Spanish and Portu-

guese, nor yet many others. The philological relations allow, the political relations forbid, us to do so.

The limitation at the other extremity is somewhat more practicable ; though it is, by no means, without its complications. That certain forms of speech, which, in common parlance, are called *dialects* rather than *languages*, are mutually unintelligible, I believe ; though, at the same time, I am sure that they are rarer than is supposed. Are these to be called languages ? If so, it is very possible that there may be more than one language in both Italy and Germany ; in both Spain and France ; possibly in both England and Scotland. How far this is actually the case is another matter. The question now under notice is the application of certain terms to certain cases. It must not be too strict where the form of speech is new, and the class to which it belongs has been but little studied. We may say that every mutually unintelligible form of speech supplies us with a fresh language ; and, in languages of this kind, Africa and the New World abound. They are conveniently called *languages*, because we have never been in the habit of talking about them as dialects ; in fact, we have hardly talked about them at all.

If the phenomena of transition create difficulties in our classification when we look to the geography of our languages and dialects, still more do they do so when we take cognizance of them in time. Changes of some sort are always going on ; and, as long as any language lasts, such changes affect it—in the course of a single generation but little, in the course of many generations, much. The result of this is, that extreme forms differ notably ; intermediate ones notably or slightly, as the case may be, *i. e.* as they approach each other. At the point of contact, the difference is imperceptible. The Latin of Ennius, and the Italian of Leopardi, are the extremes of a long chain. So is the English of the present writer and the Anglo-Saxon of Ælfric.

That each gives us a different language is beyond doubt, but it is also beyond doubt that there has been no period in the history of either the Italian or the English when the speech of the grandson was unintelligible to the grandfather, and *vice versâ*.

Next to the difference between dialects, languages, and groups, comes the notice of the general phenomena connected with their distribution over the earth's surface. They may be studied in any one of the great continents. They may be studied in the islands of the Indian Ocean and the Pacific. They repeat themselves. Sometimes there is a vast area with only a single language covering it. Sometimes there is a multiplicity of mutually unintelligible forms of speech within the limits of a narrow area. We find the illustration of this in politics. There are large homogeneous kingdoms, like France. There is a concatenation of petty principalities, like the German states. Hence, there are areas characterized by uniformity of language spread over a large surface; and areas characterized by a multiplicity of mutually unintelligible forms of speech spread over a small one. Besides which, there are languages of a moderate, or medium, area.

Some of these areas are continental, *i. e.* extend over vast tracts of continuous *land*. Sometimes they are oceanic, or spread over islands, archipelagoes, and chains of archipelagoes. Between these two there is one important difference. Languages of a continent touch each other at their circumferences and may or may not graduate into each other. Languages of an archipelago are definitely bounded. We always know where their circumference is limited. The limit is the sea, and the sea is mute.

The continental areas lead to another matter for consideration. Why are the small, small? and the great, great?

Whatever may be the extent of the following fact, it

is for certain great districts, an undeniable one. The present writer may extend it further than others. Every one, however, recognizes it as a fact of *some* extent, greater or less. Particular languages spread and obliterate intermediate forms, and when these intermediate forms are obliterated, languages, originally different, come in contact. The lines of demarcation then become clear and clean.

At the present moment there are three languages connected with each other indirectly, and that not very remotely; but, still, when compared with the intermediate forms, separate, substantive languages — languages which no one can confound with each other. They are the French of Paris, the Italian of Florence, the Castilian of Madrid—three lettered and literary languages. The provincial forms of all these are both numerous and well-marked, and at the circumferences of their several areas they stand in strong contrast to the central forms. In still stronger contrast do the northern and southern, the eastern and the western *patois* stand to each other, *e. g.* the Béarnais to the Walloon, the Calabrian to the Sardinian, the Murcian to the Gallician—the Gallician being, though a dialect of Spain, almost as much Portuguese as Spanish. With differences like these, it is probable that on the French and Spanish, and the French and Italian frontiers there may be dialects of which the philological position is ambiguous; dialects which, whilst they graduate towards the French of Paris in one direction, are intelligible to the speakers of dialects which graduate in the Castilian and the Florentine on the other. Such is actually the case. There is more than one *patois* of French Savoy which may pass for a form of the Northern Italian; but, on the other hand, there are many dialects of Northern Italy which may be called French. Again, there are forms of the Provençal which are quite as Spanish as French.

The line, then, of demarcation is in some cases obscure or faint. Yet the forms of speech are grouped. This is done by arranging them round some centre, and calling them French, Italian, or Spanish, as the case may be. To do this, is to classify according to *type*. In this way the dialects of the French, and many other languages may be classified: indeed, it is to dialects, or languages that approach them, that the classification by type best applies. The main languages, however, are classified by *definition*, *i. e.* by such clear and undoubted lines of demarcation as separate the English from the German, the Swedish from the Dutch. Between these there is no doubtful frontier.

Though it cannot be denied that a classification of languages, according to the extent to which they simply bear a likeness to each other, is practicable, it may safely be said that, for all the ordinary classifications, they go upon *likeness*, and something more. They go upon either a real or supposed *affinity*. Nor is this difference unimportant. There is, between most languages, a certain amount of likeness independent of any historical connection. This means that a certain number of words in different languages will be, more or less, like each other, not because two or more tongues have borrowed and lent, nor yet because one mother-tongue is at the bottom of the whole, but because the human organism (by which is meant the mind and the organs of speech taken together), under certain conditions, acts with a certain amount of regularity.

Again—languages, between which the relationship or historical connection may be of the slightest, may resemble each other in points of great importance, simply because they are both in the same stage of growth or development.

The historical philologue looks upon languages and dialects, as a genealogist looks upon sons and nephews, uncles and cousins. If the family likeness coincide

with any nearness of kinmanship, well and good; but it is not necessary that it do so. The grandson may resemble the grandfather, rather than the father, and first cousins may be liker each other than brothers and sisters. If so, he takes the likeness as he finds it. He takes it as he finds it; inasmuch as it is a family tree, rather than a family picture, with which he deals.

In one important point, however, this comparison fails. The philologue who looks upon languages from the historical point of view has, in most cases, to infer the relationship from the likeness: in this respect resembling the genealogist who is taken into a picture-gallery and required to ascertain the degrees of relationship from the similarity of feature or expression; assisted in some respect by the style of painting, the dress of the individual, and other adjuncts.

For historical purposes the important parts of a language are the details; the details in the way of its words, glosses, roots, or vocables; its nouns and verbs; its adverbs and pronouns. Where these are common to two languages, the chances are that the actual relationship is in proportion to the extent of the community. This means that 50 *per cent.* implies a closer affinity than 40, 40 than 30; and so on. I give these figures chiefly for the sake of illustration. Of the application of the numerical system in general, I have no great experience—except (of course) in a rough way. No percentage, however, is conclusive. To say this, is merely to say that there are different rates, at which languages alter. If so—the one which either drops or changes the meaning of three words *per annum* will lose its likeness to the common mother-tongue, sooner than its congener which drops or changes the same number in a decennium. Percentages, then, give presumptions only. When these coincide with the geographical relations they improve.

With these preliminaries, we may lay the map of the world before us, and mark out seven great areas;—seven

great areas coinciding with seven long and broad lines of definite and decided demarcation. Two of these, being effected by the ocean, rather than by displacement and obliteration, command less importance than the rest. They cut-off the New World in the west; and the islands of the Indian Ocean and the Pacific in the south. For the present, then, little need be said about either *America* or *Oceanica*. Neither does *Africa* require any immediate notice. Its Peninsular character simplifies its philology.

The other four areas lie in the great central nucleus of Europe and Asia combined—Europe and Asia—Asia and Europe. For the purposes of ethnology they form but a single continent.

The *Western* division is the one with which we are most familiar. It is bounded on the south and west by the Mediterranean, the Atlantic, and the German Ocean; on the north, by the line which divides Norway and Sweden from Lapland and Finland. The Gulf of Bothnia then follows, dividing Sweden and Finland. Finland, though deeply indented by both Russia and Germany, is not left behind us before we reach the frontier of the Government of Vitepsk, whence our line is continued along those of Smolensk, Moscow, Vladimir, Riazan, Orlov, Voronezh, and Don Kosaks (in none of which any language other than Russian is spoken), until we reach the sea of Azov; after which the Black Sea, the Sea of Marmora, and the Greek Archipelago, lead us to the Mediterranean, with which we started. This includes Great Britain, France, Spain, Italy, Germany, the valley of the Danube, and Greece—allowance being made for the Turk and Hungarian, which are intrusive. All this really means Europe *minus* Lapland, Finland, and those Governments of Russia, in which Ugrian languages in fragments still continue to be spoken. The displacements that break up any possible transitions, which may originally have existed, are nearly all effected by the encroachment of one language

—the Russian ; the nearest approach to the original *status* being in Vilna ; where the Lithuanic come almost in contact with the Fin.

The great *Northern* area is, in Russia, conterminous with the western ; Ugrian being spoken (in fragments, and on spots like islands in a Russian Sea) in Curland, Livonia, Estonia, St. Petersburg, Novogorod, Tver, Vologda, Viatka, Nizhni Novogorod, Kazan, Penza, Tambov, Saratov, and Astrakhan. Its southern boundary is the northern ridge of Caucasus. Then comes the Caspian Sea ; then the frontier between the Turks and the Persians ; then the western and northern boundary of Tibet ; then the western and northern ones of China. This gives us the eastern part of European Russia, the Governments of Caucasus and Orenburg ; Siberia, Mongolia, and Mantshuriȧ. The boundary then becomes the Sea of Okhotsk, and the northern parts of the Pacific up to Behring's Straits. This means—roughly speaking—northern Asia, with a large part of Europe.

The chief displacements here have been effected by the spread of the Turk language ; which on the East has done, in the way of the obliteration of possible transitions, all that has been done by the Russian—all ; if not more.

The *South-eastern* area (we unconsciously, but not inconveniently, adopt the phraseology of the railway engineer) begins with the northern frontier of China ; and, as far as China and Tibet are concerned, is conterminous with the Northern, until we reach the extremity of Tibet. It there, (or thereabouts,) crosses the Himalayas, so as to include Nepaul, and the Sub-himalayan *turais*, and, at the head of the Bay of Bengal, takes the sea as its boundary. After this, the coast (with the exception of the Malayan Peninsula) leads us round Ava, Siam, and Cochin-China, to the original starting-point near Pekin. The displacements here have been effected by the Chinese and the Tibetan. The area included

gives Tibet, Nepaul, the Trangàngetic Peninsula, Asam, Siam, Pegu, Cambogia, Cochin-China, and China.

The *South-western* area contains India, Persia, and Caucasus; and the displacing languages here are the Indian, the Persian, and the Arabian; the latter being treated as African. Whether African or Asiatic, it covers an enormous area, and has effected corresponding displacements. The fact of its having done this is all that is now under notice.

1. The languages of the Western group are all in an *advanced* stage of development.

2. The languages of the Northern group are all in a *medium* state of development.

3. The languages of the South-eastern group are all in an *early* stage of development.

With a view to their stage, the first are called Inflectional, the second Agglutinate, the third Monosyllabic.

There are a few exceptions to this statement. As a rule, however, it holds good.

To enlarge upon this would be to anticipate. A notice, however, is by no means superfluous. It helps to show that the groups are *natural*. So does the fact that most of the languages of the first class are what is called Indo-European; most of the languages of the second what is called Turanian.

CHAPTER II.

Bhot and Burmese Group.—Bhot of Bultistan, Ladak, Tibet Proper, and Bútan.—Written and Spoken.—Local Dialects.—Changlo.—Serpa.—Tak.—Maniak.—Gyarung.—Tochu.—Hor.

NOWHERE is it more necessary to remember the difference between classification by the way of type and classification by the way of definition than it is in the field upon which we are now entering; the field upon which we break ground in regard to the details of our subject. Roughly speaking, this is that part of Asia which contains Tibet and the Burmese Empire — a large and irregular tract of country exhibiting great extremes both in its political and its physical character. What it is that connects them in the way of Philology we shall see as we proceed.

If we look on to the predominant languages of this vast region, and compare only the literary language of Tibet with the literary language of Ava, nothing is much easier than to draw clear and definite lines of demarcation between them. They are, at least, as different from each other as the Italian of Florence and the French of Paris. But this is only because the forms which we compare are extreme ones. The details of the local dialects give us a very different result. They give us, instead of neat and clean masses of separable languages, transitions of various kinds and in numerous directions; in other words, they preclude the classification by definition, and force us upon classification by type.

The philological boundaries of Tibet are better known than the geographical; in other words, we know, with the exception of the details of the extreme

east, all the *languages* with which the Bhot is conterminous. At its western extremity it is bounded by the Cashmirian and the Dard, on the north-west by the Turk of Chinese Turkestan, on the north-east by the Mongolian, on the south by the Hindi, the Nepaul forms of speech, the Dhimal, the Bodo, and the Garo. The mountains that bound the valley of Asam to the north are, more or less, Bhot. But of these, more will be said in the sequel.

The word Bhot, or Bhotiya, meaning a Tibetan, is the root of the words Butan and Bultistan; Bultistan being the Persian for the land of the Bultis, *i. e.* Little Tibet.

In Bultistan, the creed is Mahometan, the frontier Turk and Indian, the blood (apparently) more Paroparmisan than the language. Of the literature and the dialects I can say nothing, having seen no written compositions from Little Tibet. Neither can I say whether the alphabet is exclusively Arabic. The dialect, however, for which we have any specimens, is that of Ladak; that of Ladak being that of Tibet in general.

In Ladak, both the creed and literature are Buddhist, and the blood seems to be as purely Bhot as the language. The political relations, however, are with British India and Cashmir, rather than with China; and it is only when we reach the Chinese parts of Tibet that we find the Bhot characteristics at the *maximum*. Here are preserved, in innumerable monasteries, heaps upon heaps of Buddhist literature, in which translations from the Sanskrit take an inordinate degree of prominence. The alphabet in which they are written may date from the second century. It is of Indian origin; though, in its present state, a well-marked variety.

Between the Tibetan as it is written, and the Tibetan as it is spoken, it is usual to draw a broad distinction, inasmuch as the former either actually preserves, or appears to preserve, a number of letters with which

the latter dispenses. These are exhibited in *italic* type.

Bútan differs from Tibet Proper, chiefly in being more open to influences from India. The Bútanis call themselves Lhopa.

Another, and a more extreme form of the Eastern Bhot, is the language of Takyul, or the land of the Tak, or Takpa, which is the country marked Towang and Towang Raj in the ordinary maps.

English.	Lhopa.	Takpa.

Beside the Bultistani, Ladaki, Thibetan, and Butani varieties, there are several local dialects, of which, as may be supposed, we know but little. In Lower Kunawer the language is Indian rather than Bhot; but in Upper Kunawer there are the Kanet dialects and sub-dialects. In Rampur, *Milchan** is the word for the language in general of the parts around, so that the Milchan is the

* Probably the Hindu *Mlech*.

language of the district; of which the Lubrung (or Kanam) and the Lidung (or Lippa) are varieties. Meanwhile *Theburskud* denotes a provincial dialect, such as that of Súgnúm, and others.

One of the Bútan dialects is known under the name Changlo. It is spoken in the North-east, apparently in contact with some of the languages of the Asam mountaineers.

The Chinese call certain rude tribes in the south-east of Tibet, and (consequently) to the north-west of their own frontier, *Sifan*, a term said to mean Western Barbarian.

The area to which this name applies is anything but well marked. A line drawn from the Koko Nor to the frontier of Yunnan will pass through it. But the frontier of Yunnan is a long one. The Thochu, Manyak, and Gyarung vocabularies belong to this district; all being, *inter alia*, collected through the exertions of Mr. Hodgson.

Of these, the Manyak lies to the south, the Gyarung in the centre, and the Thochu to the north. I have little hesitation in saying that, though Chinese in respect to their political relations, and Tibetan in respect to their geography, these three forms of speech are as much Burmese as Bhot.

The Hor, or Horpa, occupy the western part of Northern Tibet and parts of Chinese Tartary, or Little Bokhara, and Dzungaria. They decidedly touch both the Turk and Mongol areas; and, as they are nomads rather than agriculturalists, they are more Tartar in habit than Tibetan. At the same time, their language is Bhot; and so, to a great extent, is their creed. The major part is Buddhist: though there are some Mahometans amongst them—a few within the frontier of Tibet; more beyond it. To some of these the Tibetans apply the name Kháchhe; which is, word for word, the Chinese Kao-tse. They call themselves, however, *Igúr;* and from this, along with a few other facts of less importance, I look upon them as Turks in blood, though Bhot in language.

The details of the Tibetan, where it comes in contact with the languages of the Paropamisus, are obscure. They will be noticed in the sequel.

CHAPTER III.

Nepalese and Sikkim Languages.—Gurung and Murmi.—Magar and Bramhú.—Chepang.—Háyú.—Kusunda.—Newar and Pahari.—Kiranti and Limbu.—Lepcha.—Dhimal.—Bodo.—Garo.—Borro.—Sunwar.

It is convenient to speak of the languages of Nepaul and Sikkim as if they constituted a definite group. It is convenient to do this, because these countries, with their peculiar political relations, though Indian in their geography, and Tibetan in their ethnology, are neither exactly Tibetan, nor exactly Indian as a whole; but rather a district *per se*.

The dialects and sub-dialects of this class are referable to the following groups:—(1), the Gurung; (2), Magar; (3), Chepang; (4), the Háyú; (5), the Kusunda; (6), the Newar; (7), the Kiranti; (8), the Lepcha.

(1). The Magar occupy the lower, the Gurung the higher levels of the Himalaya; the Gurung being, like the Magars, a military caste; but (unlike the Magars), being Buddhist rather than Brahminic; and, as such, more Bhot, in respect to their civilization, than Indian. Some of them are, perhaps, more pagan than Bhot. They are a rude set; shepherds rather than agriculturalists; but little being known of their language. The Murmi is one of its dialects.

English.	Gurung.	Murmi.
Man	mhi	mi

Three	song	som
Four	pli	bli
Five	gna	gna
Six	tu	dhu
Seven	nis	nis
Eight	pre	pre
Nine	kuh	kuh
Ten	chuk	chiwai.

(2). Occupants of the lower levels, and the western districts, the Magars have been in more than ordinary contact with the Hindús of the Oude and Kumaon frontiers. No wonder, then, that the blood and language but imperfectly coincide. Many Hindús are said to speak Magar, whilst numerous Magars have either unlearnt their own tongue or speak the Magar along with it. The creed is imperfectly Brahminic; the alphabet Indian; the tendencies and civilization Indian.

The Bramhú dialect, spoken by a degraded population of the parts about, is more Magar than aught else.

English.	Magar.	Bramhú.

Four	buli	bi
Five	banga	banga.

(3, 4). The Chepang and Váyú, or Háyú, is a broken and depressed tribe of this district. The Váyú consider themselves a distinct people, falling into few or no subdivisions. Their language is said to be unintelligible to any one else; and so it seems to be from the specimen. They believe that at some remote period they were a powerful people, though now reduced.

(5). The Kusunda are even more broken up than the Váyú, with whom they are conterminous.

English.	Chepang.	Váyú.	Kusunda.

Two	nhizho	nayung	ghigna
Three	sumzho	chuyung	daha
Four	ploizho	bining	pinjáng
Five	pumazho	—	pagnangjáng.

(6). The Newar belongs to the central valley, or Nepaul Proper, the most favoured tract of the kingdom, and the tract where the rudeness of the original paganism is at its *minimum;* the creed being partly Brahminic partly Buddhist. The Pahri, or Pahi, one of the broken tribes, is Newar; in other words, the Pahri is to the Newar as the Bramhú was to the Magar.

English.	Newar.	Pahri.
Man	mijang	manche

(7). Occupants of the valley of the Arun, and the district which takes its name from them, the Kirant,

Kiranti, or Kiratas, are the most eastern of the tribes of Nepaul, being conterminous with the Lepchas of Sikkim. The name is Indian; so that little is to be inferred from either its antiquity or the extent of its application. Whenever there was a population in a certain relation to the Hindú, the term would apply.

The Kirata under notice, fall into two primary divisions, the Limbu and the Kwombu. The Limbu have an alphabet: the Kwombu dialects are unwritten.

English.	Kirata.	Limbu.

Seven	bhagya	nuksh
Eight	reya	yetsh
Nine	phangya	phangsh
Ten	kip	thibong.

Until a few months back, the Kiranti language was in the same predicament with those that have just been noticed. Perhaps, it was less known. At any rate, it took no remarkable prominence in the philology of

Nepaul. It might consist of a single dialect, or of many. It was akin to the Limbu and the Limbu akin to it. Of its other varieties we knew nothing. A recent paper of Mr. Hodgson now supplies vocabularies for its dialects and sub-dialects; for which the following is the suggested classification:— 1. Waling; 2. Yákha; 3. Chourásya; 4. Kulung; 5. Thulung; 6. Bahing; 7. Lohorong; 8. Lambichhong. These constitute the Waling branch of the Bontawa group, of which 9. Rúngchhénbúng; 10. Chhingtáng, are also members. Then come, 11. Chamling, or Ródóng; 12. Nachhereng; 13. Báláti; 14. Sángpáng; 15. Dumi; 16. Khaling; 17. Dungmalu.

(8). The Lepcha spoken in Sikkim, is, like the Limbu dialect of the Kiranti, a written language; though its literature is of the scantiest.

Star	sahor		

Now, all these languages are not only members of the same great class with the Bhot, but the fact of their being so is clear and patent upon the most cursory inspection. No language, however, of a Brahminic or a Buddhist population, especially if it be on the frontier of Hindostan, can escape the certain results of contact with India; and this shows itself in the vocabulary. The proportion which these Indian elements bear to the rest,

varies with the language. It may be but small. It may be moderate. It may be so great as to destroy the original character of the tongue altogether. In the following languages, the numerals are Hindú; and, though this is an artificial characteristic, it is a convenient one. It gives a Hindú aspect to the vocabulary; and, as a general rule, where the numerals are Hindú, a very great proportion of the other words is Hindú also—so much so, indeed, as to make the position of the language, on the first view, equivocal. In some cases it may really be so. The first language of our list is, in the eyes of many, a dialect of the Hindú, containing a few Bhot fragments, rather than a Bhot dialect in what may be called a metamorphic form.

1. The Kooch of Kooch Behar, as spoken by the Mahometan and Brahminic sections of the name. The Pani Kooch, or unconverted Kooch, are believed to use a more decidedly Bhot form of speech.
2. The Daráhe (or Dahi) and Dénwár.
3. The Kuswar.
4. The Tharu.
5. The Pakhya.

The populations which speak them are called, by Mr. Hodgson, to whom all the details are due, the Broken Tribes. His list contains, besides the preceding, the Chepang, the Bhrámo, and the Pahrí. These, however, are not only clearly Nepalese, but have been referred to a given Nepalese language, and subordinated to it as a dialect. It is the *equivocal* character of the foregoing languages that places them in a group by themselves; a group which is merely provisional, as further researches will show.

The *Dhimal*, avoiding both the open plains and the mountain heights, occupy the *turai* between the Konka and Dhorla, where they are conterminous with the *Bodo*. Nor is this all. The two populations are not only conterminous but intermixed, each inhabiting separate

villages. For all this, there is a notable—I might say a wide—difference between their languages. It is with the Háyú, and Kusunda group, or, at least with the languages to the west, that the Dhimal appears to have its closest affinities. The Bodo, on the contrary, is all but one with the Borro of Cachar, besides being closely allied to the Garo of the Garo Hills, in the north-east of Bengal.

The Bodo are called by the Hindús, Mekh, or Mlech ; and they are so called because they pass for impure infidels.

The Borro of Cachar take us into Asam ; and (of Asam) towards the southern, rather than the northern, boundary. But the northern boundary is the one that we must first examine ; remembering that the mountain-range which forms it runs due east from that part of Bútan which gave us the Changlo and the Takpa vocabularies.

Of the Sunwar vocabulary of Hodgson I am unable to give the exact locality.

Of the preceding forms of speech, the Gurung, Magar, and Kiranti, seem to be the most Bhot; whilst the Newar and Kusunda point the most decidedly towards India; the Garo to the Singpho; and the Lepcha to the North Asam, class.

CHAPTER IV.

Languages of Assam.—Northern Frontier.—Aka, Dofla, and Abor.—Miri.—Mishmi.—Southern Frontier.—Kasia.—Mikir.—Angami.—Nagas.—Singpho.

COLLECTIVELY, the Aka, Dofla, Abor, Miri, and Mishmi, may be called the hill-tribes of the northern boundary of Asam. They all, with the exception of a few of the Miris, lie to the north of the Burhamputer, along the banks of which the displacement and obliteration of transitional forms of speech have been great. The chief language of Lower Asam—the valley—is Indian; the Asamese, properly so-called, being even more Indian than the dialects of the broken tribes. It is limited, however, to the level country; the mountains of the southern and the northern boundary being held by aborigines. But these are separated from each other; or if continuous, are only traced in their continuity *round* the valley, not *across* it.

The hills that form the *northern* boundary of Asam are occupied by numerous rude tribes known as Aka, Dofla, and Abor; all three using dialects of the same language. That of the Miri is closely allied. Those of the Taying and Mijhu dialects of the Mishmi are further removed.

Beginning with the eastern boundary of Tibet, the order of the numerous hill-tribes of the northern boundary of Asam, of which the languages are known to us through vocabularies, is as has been given—Aka, Dofla, Abor, Miri, and Mishmi. The Miri stretch farthest across the valley, or southwards, while the Mishmi occupy its eastern extremity; where there has been a

partial displacement—a displacement effected by the Ahom and Khamti of the Thay stock, of whom more will be said as we proceed.

English.	Dofla.	Abor.	Miri.

Nine	konyong	nyet
Ten	halong	kyep.

The southern range now claims notice. We touched it when the Garo and Bodo were under notice.

Due east of the Garo country come the *Kasia* districts; the language of which is less like its immediate neighbour, than its locality suggests.

The *Mikir* believe that their ancestors came from the Jaintia Hills; but no specimen of the Jaintia dialects, *eo nomine*, being known, the value of the belief is uncertain. Their present occupancies are in North Cachar, Lower and Central Asam. The "sounds of their language," writes Robinson, "are pure and liquid," and the gutturals and strong aspirates are but few. There is a "slight nasal inflection and an abrupt cadence." Some of the Mikir are imperfect converts to Brahminism.

English.	Kasia.	Mikir.

The *Angami* succeed the Mikir; rude hill-men, pagan, and unlettered. Their language seems to fall into dialects and sub-dialects; its affinities being such as its locality suggests. They are more especially, Mikir, Aka, Dofla, and Abor.

And now begins a district where classification by means of definition is impracticable. The Angami, and

* Little moons.

the tribes to the east of them, are called *Naga*; Naga being a generic name for the wild tribes of mountains that bound *Asam* to the south. It is not, however, a name founded on their languages, and I doubt if it be natural. I think that all the Naga dialects might be grouped as *Singpho* without unduly raising the value of the class so-called.

The earliest notice of the forms of the Naga (from which I have separated the Angami) is by Brown, the fullest is to be found in the second volume of Transactions of the American Oriental Society, where there are specimens of no less than ten of their dialects, or sub-dialects.

The Jactung, Malung, and Sima dialects are closely akin to this.

In a limited sense, *Singpho* is a convenient name for a group of dialects, of which (1) the Singpho Proper, (2)

the Jili, and (3) the Kakhyen, are known by specimens. On the north-east it touches the Mishmi, and the intrusive Khamti. On the south-east it comes in contact with certain dialects of the Siamese group; being itself the nearest congener not belonging to their class.

The Singpho Proper are Buddhists, with a Shan alphabet. The Muttuk, Moran, or Moameria, are Hindú in creed, though of suspicious orthodoxy. Of their language, *eo nomine* (unless the Mithan of the foregoing table be one), I have seen no specimen. I find, however, statements to the following effect, viz. that that of the Khaphok tribe is just intelligible to a Singpho Proper; that in the Khanung there is still a resemblance to the Singpho, but that the language is no longer mutually intelligible; and thirdly, that the Khalang and Nogmun forms of speech are truly Singpho.

Of the Jili vocabulary (the only one we have) seventy *per cent.* is Singpho, twenty-two *per cent.* Garo. This gives an indirect connection with the Bhot; a connection, however, which is no closer than that with the Burmese. In short, the Singpho group is eminently transitional, its value being, in the present state of our knowledge, uncertain.

It is, probably, Singpho.

CHAPTER V.

Continuation of the Garo line.—The Khumia, Old and New Kuki.—The Continuation of the Naga line.—Munipur Group.—Koreng, Luhuppa, Tankhu, Khoibu, &c.—The Karens.—The Burmese Proper.

CAUCASUS itself, with all its accumulation of mutually unintelligible forms of speech, within a comparatively small area, is less remarkable for the density of its languages than the parts now under notice. Whether we look to the Garo, Kasia, and Mikir areas themselves, or the parts which immediately underlie them, viz: Cachar, Sylhet, Tipperah, and Chittagong; whether we look to the Naga districts of Asam and the parts that lie due south of them, or the valley of the Upper Irawadi and its feeders, we find an accumulation of actual languages, or possible dialects, such as we rarely find in the Old World elsewhere.

We may take up our line from either the Garo, Bodo, Kasia, and Mikir, or from the Nagas. I begin with the former.

The Khumia occupy the skirts, the *Kuki* the tops of the hills. Except so far as the difference of level may develope differences in their mode of life, a Kuki is a Khumia, a Khumia a Kuki. The Kuki, however, are, as may be expected, the ruder and more truly pagan tribe; the creed being, nevertheless, tinctured with Indian elements.

The Kuki, who about sixty years ago came from the jungles of Tipperah to settle in Cachar, were, at first, in the same category with the Nagas, *i. e.* naked. In the course of time they ceased to deserve the name. They not only wear clothes now, but are skilful in the

cultivation and weaving of cotton. They are well clothed and well fed; on a level with the Angami Nagas for physical strength and also with the Kasia.

In Cachar they are called the Old Kuki. They fall into three divisions—the Rhángkúl, the Khelma, and the Betch, the first being the largest. The whole, however, are under 4000.

The Old Kuki of Cachar have a New Kuki to match. Both came from the south—both from the ruder parts of Tipperah and Chittagong. They came, however, as the name implies, at different times, and, as their language suggests, from different districts. The New Kuki form of speech is not always intelligible to an Old Kuki. Mr. Stewart saw one of the Khelma tribe as much puzzled with what a New Kuki was saying to him as he would have been with a perfect stranger. On the other hand, the Manipur dialects and the New Kuki are mutually intelligible. I do not think that the vocabularies verify this doctrine, either in the way of likeness or of difference. It may, nevertheless, be accurate.

Mug is the name by which the native population of the towns and villages of Arakan is designated. The Mugs amount to about six-tenths of the whole population; one tenth being Burmese, and the remainder Hindú. The only town of importance is the capital. Some of the Mug villages lie but just above the level of the sea; others are on the sides, others on the tops, of hills. The early history of Arakan, so far as it may be dignified by that name, makes it an independent State, sometimes with Chittagong and Tipperah in subjection to it, sometimes with Chittagong and Tipperah separate. The island of Ramrí, Cheduba and Sandoway are parts of Arakan; Mug in language, British in politics.

In the hill-country the type is changed, and instead the comparatively civilized Mug we get tribes like

the Kuki and Naga. The best known of these are—

The Tribes of the Koladyn River, which form a convenient if not a strictly-natural group. The Koladyn being the chief river of Arakan, and Arakan being a British possession, the opportunities for collecting information have been favourable; nor have they been neglected. Of the names of tribes, and of specimens of language, we have no want; rather an *embarras de richesse*. Buddhism, as a general rule, is partial and imperfect; partial as being found in some tribes only, imperfect as being strongly tinctured with the original Paganism. And of unmodified Paganism there is, probably, not a little. The forms of speech fall into strongly-marked dialects, in some, into separate languages; by which I mean that, in some cases, they may be mutually unintelligible. The government seems to be patriarchal during a time of peace, ducal during a time of war; ducal meaning that a tribe, or a confederacy of tribes, may find themselves, for the time, under the command of some general chief. The story of almost every tribe is the same. It came upon its present locality a few generations back, having originally dwelt elsewhere; somewhere northwards, somewhere to the south, somewhere to the east. It dispossessed certain earlier occupants. But these earlier occupants may, in their turn, be found in fragments, consisting of a single village, or of a few families. The form that the history, if so it may be called, of these marchings and countermarchings, of these fusions and amalgamations, of these encroachments and displacements, assumes, is deserving of notice.

One of the forms of tribute to a certain conqueror of one of the branches of the Khyens was the payment of a certain number of beautiful women? To avoid this the beautiful women tattooed themselves, so as to become ugly. This is why they are tattooed

at the present time. So runs the tale. In reality, they are tattooed because they are savages. The narrative about the conqueror is their way of explaining it. In Turner's account of Tibet, the same story repeats itself, *mutatis mutandis*. The women of a certain town were too handsome to be looked at with impunity; for, as their virtue was proportionately easy, the morals of the people suffered. So a sort of sumptuary law against an excess of good looks was enacted; from the date of which to the present time the women, whenever they go abroad, smear their faces with a dingy dirty-coloured oil, and so conceal such natural charms as they might otherwise exhibit.

There is another class of inferences; for which, however, learned men in Calcutta and London are chiefly answerable. Some of the tribes are darker-skinned than others. The inference is that they have Indian blood in their veins. They may have this. The fact, however, should rest upon its proper evidence. I venture to guess that, in most cases where this darkness of complexion occurs, the soil will have more to do with it than any intercourse with the Hindús. There will be the least of it on the hill-tops, less of it on the hill-sides, most of it in the swampy bottoms and hot jungles. At the same time, *some* Indian influences are actually at work.

The tribe which, most probably, is in the closest geographical contact with the Kuki of Chittagong is the

Mrú, or *Túng Mrú*, the name being native. It is also Rukheng. It means in Rukheng, or the language of Arakan, over and above the particular tribes under notice, all the hill-men of the surrounding district; this being the high country between Arakan and Chittagong. That the Mrú are the same as the Mrúng, who deduce their origin from Tipperah, I have no doubt; though I doubt the origin. They were all parts of one and the same division. At the present moment, the Mrú are in

low condition; fallen from their ancient high estate; for at one time, a Mrú chief was chosen king of Arakan; and when the Rukheng conqueror invaded the country, the country was Mrú. However, at present, the Mrú are despised. Their number in Arakan amounts to about 2800. Their present occupancy is somewhat west of their older one. This was on the Upper Koladyn; whence they were expelled by—

The Kami or *Kumi*.—The Kami or Kumi are themselves suffering from encroachments; gradually being driven westwards and southwards. They state that they once dwelt on the hills now held by the Khyens. What this means, however, is uncertain. The Khyens of a forthcoming section lie south of the Koladyn on the Yuma Mountains. If these, then, were the men who displaced the Kami and Kumi, the Kami and the Kumi themselves, when they moved upon the Mrú, moved northwards. But this need not have been the case. Khyen is a name given to more populations than one; and the very Mrú of the last noticed are sometimes called Khyen. If so, it may have been from one part of the Mrú country that the Kami and Kumi moved against another part. I do not give this as history; scarcely as speculation. I only give it as a sample of the complications of the subject. Word for word, I consider the Kami and Kumi to be neither more nor less than the name of the Khumia of Chittagong. I also think that Mrú is Miri. The Kami (Kumi) of British Arakan amount to 4129 souls.

The Sak or *Thak*.—The Sak, or Thak, are a small tribe on the river Nauf.

The Heuma or *Shendu.*—In 21° 15′ N. L. the Meeykyoung falls into the Koladyn from the east. It, of course, arises on some higher level, and this higher level is the watershed between it and the drainage of the Manipur system. The Shendu is known through a short vocabulary of Captain Ticket's.

Sylhet and Tipperah are like Asam; *i. e.* more or less Indian. The aboriginal dialects, however, are allied to each other and to the Burmese.

It may safely be said that all the preceding specimens represent dialects or sub-dialects of a single group;

all spoken by rude tribes, and all indigenous to the north-western parts of the Peninsula.

And now we go on from the Nagas. Of the frontier between the southern members of the group represented by them and the northern tribes of Munipur I can give no account. It seems, however, that over and above the civilized and Buddhist occupants of the capital and the parts around, the phenomena which we have seen in the Naga districts repeat themselves. From the southern slope of the Patkoe range the feeders of the western branch of the Irawadi cut channels and fertilize valleys, the occupancies of rude tribes.

That some of the forthcoming samples may represent dialects rather than separate substantive languages is probable. If so, as our knowledge increases, the details will be fewer. This, however, is no more than has taken place with the philology of Caucasus itself.

The language of this class which more especially leads to those of the last, is (I think) the Koreng; so that if we make the Munipur the centre of our group, the Koreng is its osculant or transitional member, leading toward the Naga division.

The following specimens are all taken from a paper by the Rev. N. Brown in the seventh volume of the Transactions of the Asiatic Society of Bengal, and they are accompanied by a table giving the percentage of words common to any of two of them:—

(1.)

Fish	nga	khai
Stone	lung	akoi
Tree	thingkung	ntau.

As the table itself, containing as it does some languages foreign to the present district, will be required elsewhere, I satisfy myself by giving the following extracts from it. The percentage of Munipur words in the preceding vocabularies is as follows:—

In the	Maring	50
„	Kapwi	41
„	Khoibu	40
„	Middle Tankhul	35
„	South Tankhul	33
„	Luhuppa	31
„	North Tankhul	28
„	Champhung	28

In the Koreng itself it is 18.

All dialects giving, in Brown's Tables, more than 25 *per cent.*, I have classed as Munipur, the classification being provisional, and, by no means implying that 25 *per cent.*, constitutes a dialect. The great point to work-out here is the *direction* of the affinities.

Word for word Koreng seems Karen; Maring Maram; and Mrú, Mrúng, and Miri.

But it is not only from the Naga that the Koreng leads. The Munipur, which has only a percentage of 16 with the Proper Burmese, has one of 15 with the Karen, 15 with the Abor, 16 with the Jili (decidedly Singpho) 21 with the Songphu, 25 with the Maram, and 25 with the Singpho.

Between the Burmese Proper and the Siamese area there intervene—

The Karen Dialects.—The Karen tribes are believed to have great extension in a vertical direction, *i. e.* from

North to South, being said to extend from 28° to 10° N. L. If so, some contain Siamese, some Burmese, and some Chinese subjects. It is the southern section, however, which is best known; the languages here having commanded great and especial attention on the part of the American missionaries, whose exertions seem to have been rewarded with unusual success. The Proper Karen dialects are the Sgau and the Pwo: to which a third form of speech the Thoung-lhú is closely allied. Limited, as it is, by the literary Burmese, the Siamese, and the Mon of Pegu, the Karen division is a natural one, so far as the dialects that belong to it are known to us at the present time.

English.	Sgau.	Pwo.	Thoung-lhú.

The Burmese Proper now finds its place. It is a literary language; and, not only is it this, but it is the only important one of the group. It has been cultivated as such some centuries—it is not safe to say how many. Perhaps it is six or seven hundred years since the first composition in Burmese was written. The alphabet is of Indian origin, and it came in with Buddhism and the Pali literature. To this, the ordinary Burmese has always been subservient; so that it has been limited to secular literature. What this is will appear when we speak of the Siamese; for the difference between the literary Siamese and the literary Burmese is but small. It is a mere difference of degree. The philological view of the Burmese is, that it was originally a dialect of the parts about Ummerapura, to which, after an alphabet had been supplied, it became current over a large district, and was embodied and kept, more or less, stationary in books. At the same time it was a dialect of a valley belonging to the broader part of a river, and, as such, was a dialect of considerable geographical magnitude in the first instance.

Its literature is purely Buddhist; and, in this, it differs from the Munipur form of speech, which, to say nothing about its being a dialect of a smaller area, was, to a great extent, Brahminic as well. But its true Buddhist literature is Pali.

The older notices, and they are scarcely older than the early volumes of the Asiatic Researches, wherein we find

valuable Papers by Buchanan and Leyden, divide it into four dialects ; the Burmese Proper, the Arakan, the Tenasserim, and the Yo. This means merely the different ways in which Burmese, *as Burmese*, was spoken. It never anticipated such divisions as the present work has indicated, viz. Khen forms of speech from the Yoma, or Yo country ; and dialect after dialect from one river, the Koladyn, along with the several southern forms found in Tenasserim ; though these are less marked than the others. I think that it merely meant the variations which the Burmese, or Avan, *eo nomine*, as a separate substantive language, underwent. According to the view implied in this division, there would have been one great, and several smaller, languages.

However, the Burmese and Rukheng (of Arakan), under this view, are as follows : —

English.	Burmese.	Rukheng.
Man	lu	youkkya
Woman	mairima	mingma
Head	k'haung	gaung
Eye	myitsi	myitsi
Mouth	n'hok	kandwen
Sun	na	nï
Moon	la	la
Star	ke'nekkat	kre
Sky	moh	kaungkan
Fire	mih	mi
Water	re	ri
River	myit	mrik
Sea	pengle	panle
Stone	kyauk	kyauk
Mountain	toung	toung
One	tit	taik
Two	n'hit	n'haik
Three	thon	thong
Four	le	le
Five	nga	na
Six	k'hyauk	khrauk
Seven	k'how-n'hit	k'hu-naik
Eight	s'hit	s'hit
Nine	ko	ko
Ten	tase	tase.

Before the Rukheng became Burmese it, doubtless, gave us the analogues of the Kami, Mrú, and Sak, multiplied by the number of the hills and valleys. With the Yoma this was still more the case ; less so with Tenasserim, where the Burmese is recent and intrusive and (as such) not to be found in the aboriginal dialects ; or (if found) found in a less degree.

One of the *opera majora* in Comparative Philology is connected with the Burmese—a prize essay of Schleiermacher's. The question to be investigated was the effect of writing upon language. Schleiermacher argued that it was slight ; and, to justify his doctrine, compared the Burmese which had, according to all opinions, been written but a few centuries, with the Chinese that had, according to many opinions, been written for almost as many millennia. He showed that both were, essentially, the same ; and he inferred from this that languages could be kept stationary without writing. The merit of Schleiermacher's treatise lay in its inductive character. It took two facts and compared them. Had the work been worse than it is (and it is not unworthy of the great powers of the writer) it would have deserved the prize simply from this fact. I imagine that the majority of the candidates worked the question *à priori;* but—

"———————— illacrymabiles
Urgentur ignotique, longâ . . . .
Nocte, carent quia vate sacro."

The first I knew of the Burmese was from this dissertation. I have not seen it quoted, either in Germany or in England. Nevertheless, from the simple fact of its inductive character, I look upon it as a landmark ; and that, not only in the philology of these parts, but in comparative philology altogether.

CHAPTER VI.

The Thay, or Siamese, Group.—Its Extent and Direction.—The Siamese Proper.—The Laos.—The Khamti.—The Ahom.—The Shans.—The Palaong.—Cultivation of the Siamese Proper.

THE general name for the group now coming under notice is either Thay, or Siamese. It is represented by the literary language of Siam; so that, being a small class, it is not very important whether we call it by the one name or the other. By a *small class*, I mean one which falls into few minor groups; also one in which the differences of its two extremes are inconsiderable. In other respects the group is a large one.

The Thay area is remarkable for its inordinate extension in a vertical direction, *i. e.* from north to south. A Thay form of speech is spoken at the north-eastern end of Upper Asam, in contact with the Mishmi and the Singpho. This is in N. L. 28°. And a Thay form of speech is again spoken at the neck of the Malayan Peninsula, or as far south as N.L. 7°. Meanwhile, the breadth of this preposterously long strip of language is inconsiderable. Neither is its continuity demonstrated. How the Khamti districts meet the Laos, or whether they meet it at all, no one knows; the details of the Singpho dialects and the Chinese of Yunnan being obscure.

The *Thay* of the Lower Menam is the ordinary Siamese; and it is in Siam where the Thay civilization is at its *maximum*. This is essentially Buddhist. I know of no Thay tribes that retain their original paganism. I know of none where Brahminism has

made progress, *and the language been preserved.* The sacred literature of Siam is in the Pali tongue; the secular in the native language. It is pre-eminently metrical; little beyond the correspondence of ordinary life being in prose. The songs are in verse, the dramas in verse, the histories in verse.

The *Lau* occupy the Upper and Middle Menam, their political relations being with Siam rather than Burma. A Lau is a Siamese Shan; a Shan a Burmese Lau: Ruder than the Siamese of Bankok, the Lau are not only lettered Buddhists, but the possessors of a somewhat peculiar alphabet.

English.	Laos.	Siamese.
Man	khón	khón
Hair	phom	phom
Head	ho	hoa
Ear	pu	pu
Eye	ta	ta
Blood	leut	leut
Bone	duk	kaduk

Two	song	song
Three	sam	sam
Four	si	si
Five	ha	ha
Six	hok	hok
Seven	tset	chet
Eight	pet	pet
Nine	kau	kau
Ten	sip	sip.

The *Khamti* of the north-eastern parts of Asam are rude tribesmen, though not unlettered pagans. Their

creed and alphabet are those of the Siamese. They are intruders, the original population having been akin to the Singpho. Such, at least, is the inference drawn from the condition of the Khaphok; the Khaphok being said to be not only serfs to the Khamti but serfs who speak a language which certain Singpho understand. A portion, however, of the Khamti area may also have been Mishmi.

The Khamti, however, are not the first members of the Thay family whose language found its way into Asam. The details of the *Ahom* conquest are obscure; as is the date of it. When it took place, however, the Ahom, like the present Siamese, were a lettered nation, with a Buddhist creed and an alphabet like the Lau. Although, at the present time, there may be found much Ahom blood among the men who speak the Indian of Asam, the Ahom dialect itself is nearly extinct.

The Thay of the Burmese Empire are called *Shans*; the Shans being the occupants of a number of small States between the Burmese, the Siamese, and the Chinese frontiers. They are neither pagan nor unlettered; their creed being Buddhist, their alphabet Lau or Thay. Of the Shan dialects, *eo nomine*, I know but little. I imagine, however, that the following vocabularies must represent something like two extreme forms; the former being from the Tenasserim frontier, the latter from the east of Bhamo.

English.	Ahom.	Western Shan.	Eastern Shan.	Khamti.
Man	kun	kúnpútrihn	koun	kun

Ten	sip	tseit	sib	sip.

The *Palaong* inhabit the valleys that lie beyond the first range of mountains to the south-east of Bhamo; the mountains themselves being the occupancy of the Kakhyen—the Kakhyen being decidedly Singpho. To the south and west lie the Shan: to the east the obscure frontiers of the northern and north-western portions of the Kambojian and Anamitic areas. The fullest specimen of the Palaong language, *eo nomine*, is one collected by Bishop Bigaudet of the Ava and Pegu Mission; upon which there is a short commentary, by Mr. Logan, with whom I, unwillingly, differ as to its affinities. I cannot connect it with the language of Cochin-China and Kambojia rather than with those of Siam and Burma; though it has (as is to be expected from its locality) decided south-eastern affinities. Mr. Logan attributes its Shan elements to contact and intermixture; in my mind, gratuitously.

Eight	ta	tam', *Anamitic*
Nine	tim	chin', *Anamitic*
Ten	keu	mu'oi, *Anamitic*.

The extent to which the Burmese and the Siamese languages have been cultivated is much the same in each. Each is the language of a Buddhist population; each is embodied in an alphabet of Indian origin; and each, as a vehicle of literature, is placed in a disadvantageous position—each being, for every thing except the most ordinary secular purposes, replaced by the Pali. From this each has taken a great number of words.

Still there is a native literature in both the Burmese and the Siamese.

The earliest inscription in the latter language is referred to the beginning of the thirteenth century; the grounds, however, that justify the assumption of antiquity are not very clear.

The popular poetry is sometimes sung, sometimes recited: the music of the Siamese being spoken of with higher praise than that of the Burmese. The chief minstrels are from Laos. When an entertainment is given, a priest is invited to the house who recites a short story or an ode. Hence, a small vernacular literature of a lyric and romantic character—a very small one. Besides this, there is an approach to the drama. Except that the ode appears somewhat worse, and the drama some-

* The numerals are apparently borrowed.

what better, than in Siam, this is the character of the Burmese literature as well.

Siam itself is, as may be expected, the chief seat of the Thay stock; probably the area which contains the greatest number of Thay individuals; at any rate that where the Thay civilization is at its maximum. Whether the blood be the purest is another question. It is probable that this is far from being the case. If the dominant population be of northern origin, there is every chance that the conquest of the country was made by a male rather than a mixed population. And even if it were not so, there is an enormous amount of Chinese elements superadded to the original basis. Pallegoix's calculations make the sum-total of the population of Siam 6,000,000. Dr. Bowring puts it at something between 4,500,000 and 5,000,000. Pallegoix's elements are as follows:—

Thay	1,900,000
Laos	100,000
Karen, Khongs . . .	50,000
Mon	50,000
Kambojians . . .	500,000
Chinese	1,500,000
Malays	1,000,000

Like the Burmese, the Siamese have encroached on their neighbours. There has been, as has been stated, a Thay conquest of Asam. Kambojia pays tribute to both Siam and Cochin-China. In the Malay Peninsula, Ligore, Kedah, Patani, Perak, Kalantan, and Tringanu are, more or less, directly or indirectly, under Siamese control.

CHAPTER VII.

The Môn Language of Pegu.—The Kho of Kambojia.—Their Original Continuity.

PEGU gives us a new language—the Môn; the name being native. It is what the inhabitants of the Delta of the Irawadi call themselves. Their neighbours the Burmese call them Talieng. The Môn alphabet is of Pali origin: the Môn literature Buddhist. The Môn themselves are now British subjects. Before the cession of Pegu, they belonged to Ava—a fact which has a bearing on the history of their language. The Burmese has encroached upon it, and is encroaching; indeed, I am told that there are few Môn who do not speak Burmese, some having unlearned their native language.

In the 16th century the king of Pegu seems to have been a powerful monarch; inasmuch as the Thay histories speak of a Pegu invasion of Siam, and a Pegu conquest. Whether, however, the leading men in this event were actual Môn is uncertain. A conquest from the kingdom of Pegu may have been effected by Burmese.

But little, too, is known of its nearest congener, the Kho, Kamer, or Chong of Kambojia. Its alphabet is Pali origin; its literature Buddhist. It appears (though the evidence is not conclusive) to fall into more dialects and sub-dialects than one.

Lying between Siam and Cochin-China, the kingdom of Kambojia has had the ordinary history of areas similarly situated. When it has been strong it has struck its own blows—to the right and to the left. When it

has been weak, it has been stricken on both sides. When the Portuguese first discovered the country, its power was at or near its zenith; and Siam and Cochin-China were, at best, but its equals. At present they encroach upon it; yet, jealous of each other, leave it a modicum of independence. So that, with the parts to the east of the Mekhong under Cochin-China, and with the western side under Siam, there is still a central portion under the king of Kambojia. The population is about 500,000, of which about 400,000 are of the Kho family, the rest being Chinese, Cochin-Chinese, Siamese, Malays, Portuguese, and half-bloods.

The Carnicobar language is Môn with Malay elements.

CHAPTER VIII.

The Andaman Islanders.

So much has been said about the black skins and the savage habits of the Mincopie or Andaman islanders, that the opinion of many ethnologists has been in favour of separating them from the populations of their neighbourhood, and either mixing them up with the so-called Negritos, or making a separate class of them. They are noticed as early as the twelfth century, *i. e.* by the two Mahometan travellers of Renaudot. These write, that beyond the Nicobar Islands "lies the sea of Andaman. The people on this coast eat human flesh quite raw; their complexion is black, their hair frizzled, their countenance and eyes frightful; their feet are very large, and almost a cubit in length, and they go quite naked. They have no embarkations; if they had, they would devour all the passengers they could lay hands on." Marco Polo writes equally unfavourably—"Andaman is a very large island, not governed by a king. The inhabitants are idolators, and are a most brutish and savage race, having heads, eyes, and teeth resembling those of the canine species. Their dispositions are cruel, and every person, not being of their own nation, whom they can lay hands on, they kill and eat."

A Paper, by Lieutenant Colebrooke, is the chief source of our knowledge concerning the Mincopie, the author being indebted to his predecessors Major Kyd and Captain Blair, for some of his facts. He describes them as plunged in the grossest ignorance and barbarity;

barely acquits them of the charge of cannibalism ; and unhesitatingly affirms that they are guilty of the murder of the crews of such vessels as may be wrecked upon their coast. Does he do this on the strength of his observation or his reading ?

The late Sir Charles Malcolm, who had had one of the natives aboard-ship with him, took considerable pains to dilute the charges that lay against this ill-famed population, and spoke in strong terms as to the gentleness and docility of the individual with whom he thus came in contact.

With the last year or two our knowledge of them has increased, and the extent to which they are Burmese is likely to be recognized.

CHAPTER IX.

Cochin-China, or Annam, and Tonkin.

THE ethnology of Cochin-China is also that of Tonkin; the language, manners, and physical conformation of the occupants of the two countries being the same. The collective name for them is Anam, or Annam; whence we get the adjectives Anamese or Anamitic, as the name of the group; which is a section of the division to which the Chinese belong. The Tonkinese call the Cochin-Chinese Kuang and Kekuang; names which are, probably, the same as Khyen and Kakhyen. The Cochin-Chinese, on the other hand, call the Tonkinese Kebak.

Tabard, in the preface to the Anamitic Dictionary, expressly states that the language is spoken beyond the boundaries of both Tonkin, and Cochin-China, and that it extends into Siam, Kambojia, and Tsampa. If it extend far into Kambojia, the Kho area must be of the smallest.

In Kambojia, where we find Buddhism, we find it connected with a knowledge of the Pali language and the use of an Indian alphabet. The alphabet, however, in Anam is Chinese; and it is Chinese which is the learned language.

English.	Cochin-China.	Cochin-China.	Tonkin.

The Anam analogues of the Ka and Chong, the rude tribes of the more impracticable parts, are the tribes of the Nguon, Moi, Romoi, Kemoi and, Diditsh (all unknown in detail), who occupy the mountain ranges between Tonkin and Cochin-China, and Cochin-China and Kambojia.

CHAPTER X

China.—Canton, Fokien, and Mandarin Dialects.—Stages.—Are there any?—Gyami.—Tanguti.

OF the *dialects* of the Chinese Proper, as opposed to the Anamitic of Tonkin, we know but little; little, at least, for such a country as China, with its vast area and its numerous inhabitants. Indeed, if we consider this, it is a country for which our knowledge of its local dialects is at a *minimum*. Elsewhere we generally know something of the details of what may be called the *fringe*; *i. e.* the tract where two countries come in contact with each other. But China has so thoroughly overlapped all its neighbouring populations, that knowledge of this kind is out of the question. Add to this, the fact of its being, *as China*, a *terra incognita* for anything but a few points on the coast.

Still there are a few weak lights. They chiefly shine on the south and the west.

The most southern dialect for which we have specimens, is that of the province of Quantong, or Canton—and next to this, that of Hokien, or Fokien, for which we have the elaborate dictionary of Medhurst. Medhurst himself was not in China; but he knew the Chinese as a resident in Liverpool, who had made it his business to attend exclusively to the Irish, might know the Irish Gaelic. He was connected with the Chinese of the great immigration to the Malayan Peninsula and the Indian Islands. Of these the majority were from the south.

Medhurst commits himself most explicitly to the

statement that there are forms of even the Canton and the Fokien dialects which are mutually unintelligible; and adds that, in his intercourse with the Chinese emigrants of the Indian Archipelago, he has more than once had occasion to interpret between them. He also adds that, in the same province, the difference of dialects is sometimes so great, that people divided by a mountain, a river, or twenty miles of country, are mutually unintelligible. That statements of this kind must be received with caution has already been suggested. Meanwhile, in the ten divisions of the province of Fokien, there are as many dialects; Fokien being one of the smallest provinces of the empire.

The Fokien is not so provincial a dialect as to remain unwritten. On the contrary, the work from which the preceding observations are drawn, is founded upon a native publication, the *Sip gnoé yim = fifteen sounds*, published in 1818, in which not only the peculiarities of the Fokien dialect are given, but the difference between the reading idiom and the colloquial. Another work of the same kind is quoted by Adelung from Bayer, and, doubtless, there are more of the same kind. This means that the Fokien, though not the classical, is one of the written languages of China.

The classical language of China is the Mandarin, it being in the Mandarin dialect that the business of the empire is carried on. It is also the language of the Chinese literature. Whatever may be the antiquity of this, the antiquity of the oldest specimen of the language is but moderate. It is, of course, as old as the oldest copy of the book that contains it, and it is very probable that it is not much older. At any rate, any antiquity beyond this that may be claimed for it, should be proved rather than assumed. Those who believe in the great age of the earliest Chinese literature, *e. g.* those who not only believe that the works of Confucius (for instance) have come down to us, but that Confucius lived some-

where between the times of Archilochus and Æschylus, reasonably expect that, as the Greek of the days of Solon differs from the Greek of the reign of King Otho, the Chinese shall do the same; not, perhaps, to the same extent, but still to some extent—to an extent sufficient to enable us to talk about the stages of the language, and to compare the old Chinese with the middle, and the middle with the modern. Something, too, they may reasonably expect illustrative of the history and development of the language; though, from the fact of the present Chinese being in an early stage of development, not very much. Little, however, of all this will they actually find. The difference between the Mandarin of to-day, and the oldest classical Chinese is (roughly speaking) the difference of two centuries, rather than two millenniums—assuming, of course, anything like an ordinary rate of change.

But is there not in China an amount of unchanging immobility, in language as in other matters, which we fail to find elsewhere? To this I answer that such may be, or may not be, the case. Let it be proven, and it is an important fact in the history of mankind. At present it is enough to state that nothing in the way of the language of China is older than the oldest copy which exhibits it, except so far as its antiquity is supported by better reasons than the supposed antiquity of the author.

Concerning the dialect out of which the Mandarin was more especially developed, we may safely say that it must be sought to the north of the province of Fokien, and the south of the province of Pecheli. This means that the group to which it belongs has its area in the middle of the empire. The extent to which it is other than southern has already been indicated. The extent to which it is other than northern, is inferred from the direction in which it has extended itself. On some points (at least) it is less archaic than the Canton.

CHAPTER XI.

Observations on the Preceding Groups.—Brown's Tables.—Affinity between the Burmese and Tibetan.—Direction of the Chinese.—Nearest Congeners to the Malay.—Indian Affinities of the Môn.

THE first reduction of the languages of the preceding chapter to anything like system is to be found in the papers of Buchanan and Leyden in the early numbers of the Asiatic Transactions. The next landmark is Brown's vocabularies and table. Of the former we have already spoken. The latter is as follows:—

	Khamtí.	Siamese.	A'ká.	A'bor.	Mishimí.	Burmese.	Karen.	Singpho.	Jilí.	Gáro.	Manipurí.	Songpú.	Kapwí.	Koreng.	Marám.	Champhung.	Luhuppa.	N. Tángkhul.	C. Tángkhul.	S. Tángkhul.	Khoibú.	Maring.	Anamese.

Whoever studies it must see that, between the percentages of the Anamitic and Siamese on one side, and those of the remaining forms of speech on the other, there are the elements of a great class. This comprises the Singpho and the Jilí—specially allied to each other. But it also gives a decided affinity between the Jilí and the Garo, which brings the languages of India and the extremity of Asam in connection.

The affinities of the Gáro with the Tibetan were indicated by Robinson, and the indication was legitimate; though it would have been better, perhaps, to have made them Burmese. At any rate it was good against Mr. Hodgson's view, which made them Indian rather than Monosyllabic at all—a view which, with laudable candour, he afterwards relinquished.

Soon afterwards additional vocabularies, accompanied with a few short but sound remarks, added the whole Naga group to this class.

The relations of the Burmese, Môn, Siamese, Anamitic, and Chinese to each other form the basis of more than one speculation. They bear upon the history of the extension and development of the Chinese itself. They bear upon the origin and direction of the Thay and Burmese movements. They bear upon the relations of the Malay languages to those of the continent. Finally, the Indian elements of the Môn have commanded attention.

1. If the nearest congeners of the Chinese be in the south and east, the lines of conquest and encroachment on the part of that inordinately-extensive population must have run north and west. At present the languages with which the Chinese lies in contact give contrasts rather than affinities. With the Mantshú and Mongol, and even with the Corean, this is notoriously the case; and, to a great extent, it is the case with the Tibetan. On the north and west the Chinese keeps encroaching at the present moment—at the expense of

the Mantshú and the Mongolian. For the provinces of Chansi, Pe-tche-li, Chantung, Honan, &c.,—indeed, for four-fifths of the whole empire, the uniformity of speech indicates a recent diffusion. In Setshuen and Yunnan the type changes, probably from that of the true Chinese to the Tibetan, Thay, and Burmese. In Tonkin and Cochin-China the language is like but different—like enough to be the only monosyllabic language which is placed by any one in the same section with the Chinese, but different enough to make this position of it a matter of doubt with many. Putting all this together, the south and south-eastern provinces of China appear to be the oldest portions of the present area.

2. Separated as they are, the Môn and Khô are liker to each other than either is to the interjacent Siamese; the inference from this being that at one time they were connected by transitional and intermediate dialects, aboriginal to the lower Menam, but now displaced by the Siamese of Bankok introduced from the parts to the northwards.

3. If so, the nearest congener to the Malay of the Malayan Peninsula is not the present Siamese, but the language which the present Siamese displaced.

The *southern* Thay dialects are not only less like the Môn and Khô than is expected from their locality, but the *northern* ones are less like those of the Indo-Burmese frontier and Asam than the geographical contiguity prepares us to surmise; since the percentage of words common to the Khamtí and the other dialects of Munipur and Asam is only as follows.

Siamese.		Khamtí.			
0	. .	0 per cent.	with the	Marám.	
0	. .	0	,,	,,	Camphung.
0	. .	0	,,	,,	Luhuppa.
0	. .	0	,,	,,	North Tánkhul.
0	. .	0	,,	,,	Central Tánkhul.
0	. .	0	,,	,,	Khoibú.
0	. .	0	,,	,,	Maring.

Siamese.		Khamtí.			
0	. .	0	per cent.	with the	Kapwí.
1	. .	1	,,	,,	Koreng.
1	. .	1	,,	,,	Songpú.
0	. .	1	,,	,,	Aká.
0	. .	1	,,	,,	Abor.
0	. .	3	,,	,,	South Tánkhul.
1	. .	3	,,	,,	Garo.
3	. .	3	,,	,,	Munipurí.
3	. .	5	,,	,,	Mishimí.
6	. .	8	,,	,,	Burmese.
8	. .	8	,,	,,	Karen.
3	. .	3	,,	,,	Singpho.
10	. .	10	,,	,,	Jilí.

The further the Thay runs south, the more it stands in contrast to the languages by which it is bounded. Those with which it has the most affinities are the Singpho dialects, and after these the Western Bhot. It seems as if the Menam directed its course. It follows its stream, displaces the forms of speech by which the Môn and Khô may reasonably be held to have graduated into each other, and, having done this, comes in immediate contact with the Malay, with which it has fewer affinities than its juxtaposition suggests. For—

The true Malay affinities are with the Khô and Môn, or rather with that intermediate variety which the spread of the Thay abolished. No wonder, then, that its connection with the languages of the continent is obscure.

4. A paper of Mr. Mason's, in the Transactions of the American Oriental Society, exhibits some remarkable points of likeness between the Môn and certain languages of India. The first numerals are especially prominent in this comparison.

Does this justify us in connecting the two forms of speech? I doubt it. The question, however, will be considered when India comes under notice.

CHAPTER XII.

The Tungús Class.—Mantshú and Orotshong.—Orthography of Castrèn's Tungús Grammar.

THE Tungús area is large in extent, irregular in outline, and obscure in its relations. On the south it comes in contact with China and Corea; on the south-west with Mongolia. Between Corea and the Amúr, it reaches the sea; the peninsula, however, of Sagalin and the mouth of the Amúr itself are Kurilian. It crops out again to the north; and the shores of the Sea of Okotsk are the occupancy of the Lamut Tungús to the south and the Koriaks to the north. There are sporadic Tungús further on—on the coast of the gulf of Penjinsk, and even in the peninsula of Kamtchatka. The Aldan, a feeder of the Lena, is pre-eminently a Tungús river: so is the Tunguska (as its name indicates), a feeder of the Yenisey. And this gives us a notion of the magnitude of the area in its western and northern prolongations. Between the Yenisey and the Kolyma it is continually presenting itself; so that there are Tungús in contact with the Koriaks, the Jukahiri, the Jakuts, and the Samoyeds. There are Tungús on the Wall of China, and there are Tungús on the shores of the Arctic Ocean.

The class falls into two divisions—the Mantshú and the Orotong or Orotshong; the former giving the Tungús of the Amúr, the latter the Tungús of the Lena and Yenisey. The former gives the Tungús of the Chinese Empire, the Tungús of the Imperial Dynasty, the Tungús of a Buddhist literature and Mongol alphabet, the Tun-

gús of the civilized section of the name. The latter belongs to Russia and Siberia, and, except so far as it has been cultivated by Europeans, is an unwritten language.

The term Orotong is Mantshú; being applied by the Mantshúrians to such other members of the stock as are other than Mantshú. The tribes, however, of the Lower Tunguska apply it to themselves. In its more *limited* sense, *Tungús* itself coincides with *Orotong*. No one ever calls a Mantshú a Tungús. A *Tungús Grammar*, however, is the title of Castrèn's work on the Orotong of Irkutsk, and its allied dialects.

In respect to the direction in which the Tungús language has spread itself it is safe to say thus much, viz. that it runs from east to west, and from south to north, rather than *vice versâ*. There are good grounds for holding that both the Corean and the Kurilian extended beyond their present limits; so that it is likely that the Mantshús were originally strangers to the Sea of Japan. The evidence that the Tungús of the Arctic and Subarctic regions is intrusive, is more satisfactory still. The head-waters of the Amúr, and the parts about Nertshinsk, give a good provisional origin to the Tungús.

The Mantshú alphabet—the alphabet of a language with a very scanty literature—is a modification of the Mongol. The Orotshong dialects, however, are given either in Russian or Italian letters: the Tungús Grammar of Castrèn being in the latter.

The following are the more important terms connected with the ethnology and philology of the Tungús:—

Lamut.—This means *sea*, and it applies to the Tungús of the Sea of Okotsk. The affinities of the Lamut dialects run in the direction of—

Dauria.—The Daurian Tungús are those of the Baikal Lake, the Sayanian Mountains, and the circles of Verkneudinsk and Nertskintsk. It is the dialects and

sub-dialects of these tribes that are more especially illustrated in Castrèn's Grammar, which most particularly gives the dialects of the Urulga and Maniko tribes. Of the language of

Tshapodzhir Tungús, we have vocabularies only. They occupy the banks of the Yenisey, and constitute the most western division of the stock.

The differences of the Tungús forms of speech lie within a narrow compass, and (I believe) coincide with the geography of the area. Between the Lamut and the Tshapodzhir there is, apparently, a greater difference than can be found between any interjacent varieties. The same applies to the Nertshinsk dialects of the south, and more northern dialects of the Yakut and Samoyed districts. In short, the different forms of speech graduate into each other. They also take slight modifications from the languages of their several frontiers. On the south, the Mantshú is encroached upon by the Chinese. In Siberia, it takes in Russian, Mongol, and Turk words. About the Mantshú of the Kurilian frontier more will be said in the sequel.

The Mongols call the Mantshú either Uzun *Dzhurtshit* or Angga *Dzhurtshit;* and this is a word which appears and reappears under a multiplicity of forms. It is *Tshurtshit*, *Zhudzhi*, *Nyudzhi*, and *Geougen;* the latter being a name of some, real or apparent, historical importance. Castrèn has allowed himself to believe that a population bearing this name in certain of the Chinese compositions, was as old as the eleventh century *before* our æra. They were barbarians who paid an insignificant tribute to China. The truly historical Nyudzhi, however, are the founders of the present Chinese dynasty, their conquests having been effected about A.D. 1644; and it may be added that a Nyudzhi vocabulary, taken by Klapoth from a Chinese narrative, is Mantshú.

Castrèn found outlying Tshapodzhirs as far west as the Obi. In Bronson, a vocabulary of the Giliak language, often—I believe, generally—considered to be Kurilian, is Mantshú.

The Mantshú call—

China	*Nikan.*
The Mongolians	*Monga.*
The Russians	*Oros.*
Nertshinsk	*Niptshi.*
The Giliak	*Fiaka.*
Korea	*Solgo.*

The last name is remarkable because the Mantshú tribes of the Upper Sagalin are called Solon; and because there is evidence of other kinds that a portion, at least, of what is now Mantshúria, was once Korea.

English.	Mantshú.	Tungús of the Amúr.

Castrèn's Tungús Grammar is drawn up in the ordinary Roman alphabet, the author having preferred this to the Russian. The latter would, indeed, have fitted the language well, being both more copious than the Roman, and being already applied to more than one language of Northern Asia. More than this: one of Castrèn's own grammars—that of the Ostiak language—is Russian in respect to its letters. Nevertheless, the Tungús orthography is Roman, the grammar itself being in German.

The introduction of the European alphabets into Russian Asia is a point which we may advantageously contemplate, inasmuch as the principles by which it has been regulated are, if not unexceptionable; at least laudable.

These alphabets are two: the Russian and the Roman or Italian. The former is the easier to handle —the easier by far. By this I mean that, when an unwritten language has to be written, and the elementary sounds of that unwritten language are new and strange, the Russian orthography can be applied with greater ease than any other in Europe. Of the previously unwritten languages, the following have, within the last few years, been embodied by means of the Russian alphabet:—

1. The Aleutian of the Islands between Kamtskatka and America.

2. The Iron, or Osset, of Caucasus; the application being made by Sjögren.

3. The Ostiak; the application being made by Castrèn. This was in 1849.

4. The Yakut; the application being made by Middendorf and Botlinck.

What have been the applications of the Roman alphabet?—what the principles on which those applications were made? To the Fin of Finland it had been applied from the beginning; Finland having, until 1812, been Swedish. On the other hand, the Zirianian and the Permian languages are written in Russian. The Estonian, however, and the Magyar are Roman; so that, on the whole, it is not too much to say that the Roman is the alphabet for the Fin family.

In 1830, the great Danish philologue, Rask, found his attention directed to the Georgian and Armenian languages; each with an alphabet one-third longer than our own, and each with strange sounds for those alphabets to express. However, they *did* express them; having signs or letters to match. These signs Rask transliterated into Roman; and that upon a principle which, though negative rather than positive, is worthy of imitation as far as it goes. He avoided the expression of simple sounds by complex combinations. If a

new sound appeared, a new sign was excogitated. It might be wholly new, it might be an old letter modified. The former gives us the better and bolder, the latter the more usual and easier, plan. However, in the proposed alphabet the Georgian runs thus :—

a, e, i, o, u, p, f, v, ƒ,
t, d, þ, k, g, ƙ, ɣ, q, x,
s, z, ś, ż, c, ʒ, ʒ, ċ, ʒ́,
ʒ̀, j, h, ħ, l, m, n, r, ŋ.

ƒ, þ, and *k*, were sounded as the *ph*, *th*, and *kh* in ha-*ph*azard, nu-*th*ook, and in-*kh*orn ; the original alphabets having thus compendiously expressed three pairs of compound sounds. If it were not for this, the combinations of *p*, *t*, *k*, and *h* would have sufficed. The ɣ was, nearly or exactly, the Arabic غ, a variety of *g*. The corresponding variety of *k* is expressed by *q*, compared to the Arabic ق. Another guttural was expressed by *x* (Arabic خ). For two varieties of *h*, were proposed ħ and ŋ ; for the sibilants *s'* (*sh*) ; *z'* (*zh*) ; *c* (*ts*) ; *c'* (*tsh*) ; ʒ (*dz*) ; ʒ̀ (*dzh* or the English *j*). Then, for a pair of sounds described as approaching *dhz*, and *dhzh*, ʒ and ʒ. The Armenian transliteration had the additional signs é, ë, t, and ṙ.

a, e, é, ë, i, o, u, p, b, u *or* w
v, ƒ, t, d, þ, k, g, ƙ, ɣ *or* ṙ
x, s, z, ś, ż, c, ʒ, ʒ, ċ,
ʒ́, ʒ̀, l, m, n, r, ṙ, j, h.

Previous to the work in which these two alphabets were proposed, the author had been engaged on the Lap of Norwegian Lapland, and had published a grammar on it, in which the signs ʒ and ʒ̀ were introduced ; as well as ŋ for the *ng* in *king*, *sing*, &c.

Though Castrèn's Ostiak Grammar, published in 1849, is in Russian, his Zirianian Grammar, published

in 1844, is in Roman letters; these being those of Rask, except that for ʒ and ʒ́, he used *dz* and *dź*. The Samoyed was the next sound-system he found it necessary to investigate. Here there were two modifications of *l*, viz., *t*, ŧ, and ɬ; the sound of the *gn* in French words like Boulogne, along with similar modifications of *d*, *t*, *s*, *z*, and *c*; which were written *dy*, *ty*, *sy*, *zy*, *tshy*—there or thereabouts.

Lastly, the Tushi alphabet of Schiefner contains ẋ, ḣ, k̇, ġ, ċ, c̣, ċ̣, ʒ̇, ṡ, ż, ṫ, ṗ, l̇.

All this, though exceptionable in many respects, is better than the system too much in vogue amongst ourselves of making combinations.

It has already been stated that there is such a thing as a Mantshú alphabet, and that it is a modification of the Mongol. This implies a Mantshú literature. It is a scanty one; as may be seen from Klaproth's Mantshú Chrestomathy. Neither is it ancient. It is possible, however, that it may be both older and more important than it seems. A paper,* by Mr. Wylie, of Shanghae, gives us the following list of Neu-chĭh translations from the Chinese, during, or earlier than, the Ming dynasty: (1,) History of Pwan-kú; (2,) History of Confucius; (3,) Travels of Confucius; (4,) Domestic Discourses; (5,) Discourses of the Wise and Able from the Domestic Discourses; (6,) History of Këang Taè-kung; (7,) History of Woo Tzyè-seu; (8,) Narrative of the Display of Rarities by Eighteen Kingdoms; (9,) History of Sun Pin; (10,) Treatise on Carriage Driving; (11,) History of Hae Tseen Kung; (12,) History of Madame Hwang; (13,) National Surnames; (14,) Ha ta yang ûrh kan,—whatever that may mean.

More interesting, still, is the notice of two Neu-chĭh inscriptions. The first, which from its *locality*, may be called the Kín-chow monument, has been seen *in situ* by no European. Neither is it copied *verbatim et*

* Journal of the Royal Society. Vol. xvii. Part 2. 1860.

literatim in China. Still, there is a Chinese work in which there is a notice of it, and in which there is a translation ; viz. *The Choice Selections from Lapidary Literature.* This is the translation of the author whom I follow of *Shĭh mĭh tseuen hwa*, by Chaou Han, and is dated 1618. It contains the Chinese equivalent of the Neuchĭh ; of which the following is the translation in English, by Mr. Wylie :—

The local military director and prince of the blood, brother to the emperor of the Great-Kin dynasty, having enjoyed a season of tranquillity within the boundary of his jurisdiction, was hunting on the south side of Leang Hill. On coming to Keen-ling (the imperial sepulchre) of the Tang dynasty, finding the pavilion and side buildings in a state of decay, every vestige of magnificence having disappeared, he gave orders to the local authorities to assemble artisans to repair and beautify the place. Now having again visited the sepulchres, finding the paintings all renewed, and the side galleries completely restored, he was inexpressibly delighted, and returned after partaking of an entertainment by the Prefect of Le-yang.

T'ëen-hwuy, 12th year (A.D. 1134), being the 51st year of the sexagenary cycle, 11th month, 14th day, Hwang Yung-ke, Territorial Secretary to the Supreme Council, and Wang Kwei, Secondary Prefect of Yew-chow, members of the suite, have written this in compliance with the command.

Translation of the preceding inscription.

The heading of the tablet reads "Record of the journey of the military director and prince of the blood, the emperor's brother."

The author of the *Shĭh mĭh tseuen hwa* adds the following note ;—name or surname is mentioned. As the date is 1134, it should be the brother of T'aé-tsung, according to the history of the Kin dynasty. She-tsoo had eleven sons ; there being eight besides Kang-tsung, T'aé-tsoo and T'aé-tsung, it is uncertain which is the one referred to. We cannot decipher a single word of this inscription, which is written in the Neu-chĭh character. This table corroborates what Wang Yuen-mei says :—"When enlightened princes are watchful over their virtue, foreigners are attracted from every region. There is a translation at the end, in the Chinese character, consisting of one hundred and five characters, inscribed on the left side, but it is entirely different. The engraved inscription is at Keen-ling, on the characterless tablet."

This is not the only notice. How far, however, the testimonies of the two authors quoted may be independent is more than I can say ; but in the *Record of the Metal and Stone Inscriptions of Shense* (*Kwan-chung kin shĭh ke*), dated 1781, the following statement

concerning the inscription in question occurs:—"the first part is written in the Neu-chĭh character, the latter part is a translation written in the ordinary character; the heading is in the seal character. At Keen-ling, in Kín-chow."

Of the other inscription, we still want even the preliminary details. There is only a general notice of its existence.

CHAPTER XIII.

The Mongol Class.—Mongolian Proper.—Buriat.—Ölöt.—Aimauk.—Pelu.—Sok.

THE Mongol area is large, but not very irregular; neither are its frontiers very varied. On the south, it marches with China and Tibet; on the west, with the Turk area; on the east, with the Mantshú. On the north, there are the Tungús and the Russian of Siberia along with the languages of a few fragmentary aborigines. There are two isolated offsets, one in Cabul, and one on the Volga. The differences of dialect lie within a narrow compass. The divisions are (1) the East Mongolian, or Mongol Proper; (2) the Kalka; (3) the Buriat; (4) the Ulut, Ölöt, or Eleut, or Kalmuk; (5) the Aimauk.

1. The Mongol was reduced to writing in (about) the time of Kublai Khan: the alphabet being taken from the Uighur Turks. The classical composition in this dialect is a Mongol history by *Sanang Seetsen.* The literary influences are, at the present time, Chinese and Tibetan. Buddhism, however, was preceded by Fire-worship and (apparently) by an imperfect Christianity.

2. The Kalka, in which the chief compositions are songs, leads from the Mongol Proper to

3. The Buriat; the Buriats being (like the Orotong as compared with the Mantshú) Siberian rather than Chinese. Amongst the Buriats, Buddhism prevails; the Buriat Christianity being inchoate, the Buriat Mahometanism inconsiderable in amount. As contrasted with the Mongols Proper, the Buriats are, to a great extent,

Pagans and in contact with Pagans—except (of course) so far as they are under the influences of Russia.

In 1831, they numbered 72,000 males and 80,000 females: the present census amounting to about 190,000. They fall into the Buriats beyond, and the Buriats on this side of, the Baikal. The former are the Khorin, the Selenga, the Barguzin, the Kudarin, and the Kudin (in part) tribes; each with some peculiarities of dialect. The latter—named after the rivers along which they lie—are the remainder of the Kudin, the Upper Lena, the Olkhon, the Ida, the Balagan, the Alari, and the Tunka divisions; the latter being, to some extent, Turk and Samoyed in blood. The Selenga form of speech is spoken in the greatest purity by the Atagan, Tsongol, Sartal, and Tabang-gut.

The Buriat of the parts about Nizhni Udinsk, the Buriat of the extreme west, call—

Themselves	*Buriat,*
The Russians	*Mangut,*
— Tungús	*Kaldzhak-shin,*
— Katshintsi Turks	*Kat-kum,*
— Kot	*Kotob-kum,*
— River Birus	*Byr-hu.*

The chief difference between the Buriat and the Kalka seems to be political. Neither is it quite certain that Castrèn's divisions between the Buriat of this side of the Baikal, and the Buriat beyond the Baikal, is natural.

The Selenga forms of speech approach most closely to the written or literary language.

English.	Selenga.	Khorin.	Nizhni Uda.	Tunkin.
Man (vir)	ere	ere	ere	ire
Man (homo)	khung	khung	kung	kung
Head	tologoi	tarkhi	tologoi	tologi

Moon	sara	hara	hara	hara
Star	odo	odon	odong	odong
Fire	gal	gal	gal	gal
Water	oso	uhan	uhung	uhungn.

4. The Ulut are the Mongols of Dzungaria; the Kalmuks of the Volga being Dzungarian in origin.

5. On each side of a line drawn from Herat to Cabul, lies, to the north of the proper Afghan, and to the south of the Uzbek and Turcoman, frontier, a great range of undulating country, often mountainous, almost always hilly, well-watered in some parts, bleak and rough in others. This falls into a western and an eastern division, with an important watershed between them. From the west flow the Murghab, the Tejend, and the Furrarud; from the east, the Helmund, the south-eastern feeders of the Oxus, and the north-western feeders of the Cabul river. The former of these districts, lower and less mountainous, is the occupancy of the Tshehar Aimauk; the latter that of the Hazara. Both are noticed in Elphinstone's Caubul: both are placed in the same category. The only doubt in the mind of the author is as to the nature of the class that contained them. He hesitates to make them Mongols. They generally spoke Persian. A sample of the language, since published by Lieut. Leach, settles the doubt —for the speakers of it, at least :—

English.	Aimauk.	Kalka.
Head	ekin	tologoi
Ear	tshakin	tsike
Nose	kabr	khamar
Eye	nuddun	nidu

English.	Aimauk.	Kalka.

Blood	khóro-gwe	*Six*	chorka
Bone	yaso	*Seven*	tolo
Day	wundur	*Eight*	nema
Sun	nara	*Nine*	yeso
Moon	sara	*Ten*	arba.

The Pelu.—From the Japanese encyclopædia, known in China as *Kho-khan Zan-zai-tu-khuy*, completed A.D. 1713, Klaproth gives a specimen of a Mongol dialect entitled *Pelu*; adding that *Pe* means *north*, and *lu* means *western barbarians*. If so, the Pelu are the north-western barbarians.

* Persian.

English.	Pelu.	Mongol.
Man	kore	ere
Woman	khoton	khatun
Father	kozike	etshige
Mother	koke	eki
Brother	teuge	dagu
Girl	oka	okin
Sky	tengri	tangri
Sun	nara	nara
Moon	zara	zara
Star	khuton	odon
Sea	talai	dalai
River	murun	muran
Water	uzo	uzu.

Word for word, I hold that *Pelu* is the same as *Paloung*, the name of a T'hay population already noticed, and of one which lay *west* of Cochin-China, and, to some extent, *north* as well.

CHAPTER XIV.

The Yeniseians.—Objections to the name Ostiak.—Castrèn's Researches.—Northern Branch.—Inbazk, Denka, and Pumpokolsk vocabularies of the Asia Polyglotta.—Southern Branch.—The Assan.—Kot.—Castrèn's Discovery of a Kot Village.—The Ara Legend.—Kanskoi and Kamassintzi vocabularies.—The Glosses *Kot* and *Kem*.—Speculations as to the original extent of the Yeniseian area.

THIS is, perhaps, the most broken-up population in the world; so that I shall say nearly all that I know about it. It is possible that a large proportion of this is ethnographical, rather than philological; still, it is so fragmentary a population that I shall write a few pages, even though they may be out of place. I shall also add my speculations as to the original importance of the class.

Yeniseian was the name proposed by Klaproth, though it is not the term used by Adelung before, nor that used by Castrèn after him. It may, possibly, be exceptionable; inasmuch as the Yeniseians are, by no means, the only populations of the Yenisey. On the other hand, however, they are nearly limited to the drainage of that river, and they also seem to be the aboriginal occupants of a great portion of its valley. They extended as far south as 53° N. L., and as far north as 67° N. L., at least. Adelung and Castrèn call them the Yeniseian Ostiaks. They are, however, widely different from the true Ostiaks—those of the Obi.

It is to be regretted that Castrèn has gone back to the old term, and that when he speaks of the populations under notice, he calls them Ostiaks of the Yenisey, just as he calls the Samoyeds of the Ket and Tshulim, Os-

tiak Samoyeds. In each case, the word is used improperly. Indeed, it is doubtful whether it is the best term for the Ostiaks Proper, though it is a convenient one. It is a convenient one, because they have no other general name at all.

The Turk is the language to which (in the first instance, at least) it belongs; for it is the Turks who apply the name. And they apply it to more populations than one. They apply it to the Ostiaks Proper and they apply it to the Bashkirs. Whether they have not applied it elsewhere, and that in unexpected quarters, is a question from which, for the present, we refrain.

When Castrèn undertook his second journey, he was specially instructed to ascertain the ethnological and philological relations of those "tribes which, dwelling between the Yenisey on the east, and the Obi on the west, bore the indefinite name of Ostiak." It is unnecessary to say that these instructions were carried out with zeal and skill. The investigation, however, was, at first, left in the hands of his fellow-traveller Bergstadi, who passed a part of the year 1846 in the village of Anzeferova, on the Pit. After a while, however, Castrèn descended the Yenisey, and, after coming in personal contact with the tribes of the Sym and parts about Turukhansk and Inbazk, made himself master of the language sufficiently to become the author of a grammar and a vocabulary.

Their most northern limit is the country about Mangaseia or Turukhansk, in 66° N. L., where their neighbours to the north are the Avamski and Karasin Samoyeds, to the west the Samoyeds of the Tas, and to the east the Tungús of the northern Tunguska river. Of the exact dialect here spoken there are no specimens. It seems to be taken for granted that it is the same as that of the next group.

This appears about 63° N. L., where, in the parts about Inbazk, the Yelogui falls into the Yenisey from

the west, and the Bakta from the east. Here the frontagers are again Samoyeds (of the Karakon section) and Tungús. An Inbazk vocabulary, *eo nomine*, is to be found in the Asia Polyglotta: akin to which is a shorter one of the Ödh (or sable) Ostiaks, who, in 1723, called themselves Denka. According to Messerschmidt, they could count no further than five. The Denka were especially found on a stream called Ödh-Shosh (*Sable river*), a feeder of the Podkamennaya Tunguska—the name being apparently of Tungús origin; for several of the Tungús tribes call themselves Denka, which means, in Tungús, men. Though it is expressly stated that this name was native, and as there is no sign of the word under notice having any meaning in any Yeniseian dialect, it is possible that the blood of the Denka was Tungús. Be this as it may, the dialect belongs to the Inbazk division.

In 60° N. L., the Sym and Pit fall into the Yenisey, much after the manner of the Yelogui and the Bakta; the former from the west, the latter from the east. The banks of each are Yeniseian localities. A little to the south of the latter lies the village of Anzeferova, the spot where Bergstadi and Castrèn made their chief researches in the Yeniseian. Hence, it must be supposed that it is the Pit and Sym forms of speech that are most particularly represented in the grammar. The frontier on the east is Tshapodzhir; on the west, Samoyed and Ostiak.

To the south and west, the Ket is a Yeniseian locality, the dialect of which is represented by the Pumpokolsk vocabulary of Klaproth, a dialect which, like the last, is in contact with the Samoyed and Ostiak. The river Kem, which falls into the Yenisey, a little below Yeniseisk, bears a Yeniseian name. Of the Yeniseian of the Ket, as represented by the Pumpokolsk vocabulary, I think that thus much may be said, viz. that, notwithstanding certain special affinities with the dialects of the

next group, it is a northern rather than a southern form of speech, *i. e.* that it belongs to the Sym group of dialects.

About 57° N. L. is the boundary of philological area; and we no longer meet what may be called the proper Siberian populations, like the Samoyeds, Ostiaks, and Tungús, but populations whose language is Turk. In other words, the philological frontier changes; and, with it, change the Yeniseian forms of speech. All the preceding dialects appear in Castrèn's Grammar, under the name of Ostiak of the Yenisey. The name that now presents itself is Kot.

A few Russianized Kot were seen by Castrèn as far west as Ansir, Barnaul, and Yelansk. They stated that they were a remnant of the Baginov Uluss, which migrated from the River Poima. These, he thinks, are the Yeniseians, whom Klaproth calls the Kongroitshe, a name which, he also thinks, has originated out of the Tartar name for Krasnoyarsk, the town where the tribute was paid. It means, a place with a bell. The Poima is a feeder of the Ana.

Now, it is on the Ana, along with the Ussolka, that Klaproth fixes another division of the southern Yeniseians, of whose language he gives a specimen, which differs from the Kot only as one dialect or sub-dialect differs from another. He calls them the Assan. Castrèn sought for them with care and pain. He found none on the Ussolka; though he especially visited the chief or only volost on its drainage. All he found was Russians, who knew of nothing older than themselves. Two families were, apparently, of Tungús blood; but nothing did either they or any one else know about the Assan.

Neither was he successful on the Lower Ana. Towards its head-waters, however, he found an account of some Kot who had lived there lately, but who had been ordered to move to the Uda, where they then lived with

the Buriat, in a village named Badaranovka, thirty versts below Nizhni Udinsk. Before they left the Ana, they spoke Buriat. They amount, now, to eleven tribute-payers, half of whom (the division is difficult) speak Buriat, half Russian. They call themselves Kotovzy, the name being native, the form Russian. The Karagas Turks call them Kodeglar. I imagine that these are the Assan, or nearly so.

At length, he found the Kot, *eo nomine* and *eâ linguâ*. But they were but a fragment. Their original area was the drainage of the river Kan. There were Kot settlements near the present villages of Agulskaya and Korastelia. There were Kot settlements about Ansir, Yelansk, and the now important town of Barnaul. A few years ago, seven Kots paid tribute from the neighbourhood of Kansk. The Agul, the Kungus, and the Ulka were once Kot rivers. There were Kots on the Mongol frontier, whose language is now that of the Buriats.

Nevertheless, a few speakers of the Kot language still exist; a single village on the Agul being their locality—their neighbours being Kamass Samoyeds, themselves more than half Turk.

The Kot of the Agul, being lighter taxed than if they were passed for Russians, make much of their little nationality, and keep up their language accordingly. Five individuals from the settlement were seen by Castrèn; and his Kot Grammar was the result.

The Arini were all but extinct in the middle of last century. A specimen, however, of their language has survived. So has the following legend:—

Before they left the main stream of the Yenisey for their present occupancy in the district of Sayania, and whilst they called themselves *Ara* (being called by the Russians *Arinzi*), they lived part of the year in one place, part in another. Their summer residence was an island in the Yenisey, named, in Russian, the Tates-

hewki Ostrog. In winter, they joined the Katsha Turks, and fed their flocks on Mount Kumtige, near the Katsha. Their tribe was, at first, a large one; but they fought against each other, and became weak. While these wars were going on, a young Ara walked out, and found a snake. He cut it in two. The head, which still kept in a little life, went back to the king of the snakes, and told his tale. So the king of the snakes held a council, and asked the wise men of Snakeland what was to be done. It was summer-time, and all the Ara were in the island. The snakes agreed to do this—they were to swim across to the opposite bank, and then cry out, "Boat! boat!" So they swam across, and the Ara heard a cry of "Boat!" They went with all the boats they could muster: but, wonderful to relate! they found no men on the shore (for they thought that it was one of their countrymen who had called), but only snakes—especially young ones. There were more young than old. They were almost all young ones, and they all wanted to speak—all at once. But the old king of the snakes told them to be quiet, and then put as many of them in the boat as it would hold. Then he made the old man row them over to the island, one boatful after another, until they were taken across. Then the king of the snakes himself got in, and was rowed over by the old man in like manner with the rest.

As they were rowing, the king of the snakes said to the old man, "When you get back again to your own home, remember to strew ashes all round your tent, and then to drag over them a sail-cloth of two different colours, and made of two kinds of horse-hair—one white, the other black." So the old man did as the king of the snakes had bid him; and went home, and took the ashes, and dragged over them a sail-cloth made of two kinds of horsehair, and went to rest. And he awoke in the morning, and, behold! the whole Uluss was gone, and all the men of the tribe dead. Only the

old man and his family were spared; and from him come all the Ara.

When an Ara dies, his bow and arrows are placed in his grave, over which his best horse is slaughtered, and flayed. The skin is then stretched over a pole, set up on the grave, and the flesh is feasted on. The women, after their confinements, wash themselves three times within the first seven days, and then fumigate themselves with a herb named *irben*. The first friend that visits them names the child. Their oaths are taken over a bear's head, of which the swearer fixes his teeth in the nose. When a sentence equivalent to banishment is pronounced against a culprit, he is placed between a dog and a reindeer. These are then set free. Whichever way they run must be taken by the man also, who is no longer allowed to remain where he was. Even a draught of water from his old locality is forbidden. So is all further intercourse with any of his original neighbours. These remarks apply to the Dzizerti or Yesirti, as well as the Ara; the Dzizerti being, like the Ara, an extinct or amalgamated tribe.

The word Ara is said to mean *wasps;* the population to which it applies being so denominated from their warlike activity. But it most likely means nothing of the kind. Word for word, it seems to be *Yarang*.

I think that, in investigating the extent of the original area of the Yeniseians, we may use the words *ket* and *kem* as instruments; the first meaning *man*, the second *river*.

Let us consider, then, the presence of these forms as a presumption in favour of Yeniseian blood, and ask how far they lead us.

(1.) *Kot*, *ket*, &c.—The Mongol form for the Teleuts is Teleng-*gut*: the Teleuts being considered to be Mongols in blood, though Turk in language.

The Ir-*ket* are a small tribe of fifty-seven tribute-payers, near Tunka—at present considered as Soiot. What Castrèn heard about the Irket was that they had migrated from the river Sikir, and that they had divided themselves into two divisions. One took to the level country belonging to the Bucha Gorkhon tribe of

Buriats. With these they intermarried, probably from the necessity of their taking a wife out of a tribe different from their own; they themselves being only a single tribe.

(2.) *Kem.*—The twenty-eight Dyon or Yon of the Tshulim Turks were originally called Tutal, a name which is now limited to two of these tribes. The people of the towns call them Uriankhai. The Tutal name, however, for the Tshulim river is Tshum. I think that, word for word, this is Tom as well as Kem and Tshem. In the Pumpokolsk dialect this (*tom*) is the actual word for *river.*

The Alakh and the *Kem*-tshik form the western sources of the Yenisey, which is named by the Chinese and the Mongols Ulu *Kem* = great river, *ulu* being a Mongol term, but *kem* a Yeniseian one. Here dwell the Soyon, Soyony, or Sayanzi, the only names, according to Tshitshatsheff, which are known in these parts; the form Soiot being inaccurate. The language and manner of life of these nomads are partly Mongol, partly Turk. At present they fall into two divisions, one of which is directly dependent upon China, whereas the other is under a *zaizan*, who resides at Urgha. This confirms the doctrine suggested by the word *Irket*, viz. that the Soiot are, more or less, Yeniseian in blood.

I now subjoin the following vocabularies from Stalenberg :—

(1.) That of the Kanskoi, of the river Kan, who call themselves Khotovzi.

English.	Khotovzi.	English.	Khotovzi.
One	opp	*Ten*	büd
Two	tzida	*Eleven*	büd-op
Three	naghor	*Twelve*	büd-tzida
Four.	thæta	*Twenty*	tuserm
Five	ssoumbulang	*Thirty*	nogh-tuserm
Six	muctu	*Forty*	nogh-opp-tuserm
Seven	seigbe	*Fifty*	soum-tuserm
Eight	schidætæ	*Sixty*	mouck-tuserm
Nine	togus	*Seventy*	seig-tuserm

English.	Khotovzi.	English.	Khotovzi.
Eighty	——	*Fire*	thuy
Ninety	togus-thiserm	*Water*	ai
Hundred	thun	*Earth*	dscha
Thousand	byat-tun	*Mountain*	bia
God	num	*Sun*	kaya
Father	abam	*Moon*	kysschtin
Mother	imam	*Horse*	nunda
Brother	aya	*Head*	stiba
Sister	yhæ	*Man (homo)*	hya.
Wife	nah		

This is Samoyed. Still, the people call themselves *Kotovzi ;* as do the existing Kotovzi, who are probably their descendants, but who speak *Buriat.*

(2.) That of the Kamacintzi, who call themselves Kishtim, and live on the River Mana :—

English.	Kamacintzi.	English.	Kamacintzi.
One	chuodschæ	*Sixty*	hkelusa-tu
Two	ynæ	*Seventy*	hkelina-tugu
Three	tonga	*Eighty*	cheltong-tugu
Four	schagæ	*Ninety*	hwelin-tugu
Five	hkagæ	*Hundred*	duss
Six	hkelusa	*Thousand*	hag-duss
Seven	hkelina	*God*	esch
Eight	cheltonga	*Heaven*	urach
Nine	hwelina	*King*	patschai
Ten	haga	*Water*	uhl
Eleven	haga-chuodschæ	*Earth*	pang
Twelve	haga-inæ	*Mountain*	kgy
Twenty	yn-tung	*Sun*	egæ
Thirty	tonga-tu	*Moon*	tzui
Forty	tonga-tu-chuodschæ	*Wind*	japei.
Fifty	hkog-tugu		

These are simply Yeniseian.

(3.) A Turk dialect in the Asia Polyglotta head *Kangazen*, in the few words, wherein it is other than Turk, is Yeniseian.

CHAPTER XV.

The Turk Languages.—Import of the term.—The Uighur.—Tshagatai.—Uzbek. — Turcoman. — Kirghiz. — Barabinski. — Tshulim. — Teleut. — Koibal. — Karagas. —Soyony. — Yakut. — Bashkir. — Kazan. — Nogay. — Meshtsheriak. —Kumuk. —Kuzzilbash.—Cumanian.

WHEN the word *Turk* is used by either the ethnologist or the philologue, it has so wide a signification that the Turks of European Turkey form but an inconsiderable fraction of the great population to which it applies. The so-called Tartars (or Tatars) of Independent Tartary are Turks; so are the Turcomans of the Persian frontier; so are the occupants of more than one district named Turkestan; so are several other populations with several other names. Even in respect to its literary development, the Turkish of Constantinople divides its honours with the Uighur and Tshagatai dialects, which, at the present time, are, comparatively, inconspicuous dialects, but which, in point of priority of culture, are to be preferred to their congeners of the west.

Turk, then, is a generic name, and the class it applies to is a large one. Its area is of great magnitude, and that in every direction. A language intelligible at Bokhara is spoken on the very confines of Africa. A language scarcely unintelligible at Constantinople is spoken at the mouth of the Lena, on the shores of the Arctic Sea. We have a vocabulary of the Cumanian Turk once spoken in Hungary. The Uighur Turk is spoken, at the present moment, on the frontiers of Tibet and Mongolia.

The Turk area, then, is large, and it is irregular as well; and very various indeed are the districts with

which it comes in contact. In the south-east, it touches Tibet; in the south, India and Persia. By the Kurd, Arabic, Syriac, Armenian, and Greek, the Turkish of Asia Minor is irregularly bounded. It mixes itself with the languages of Caucasus; is spoken in contact with the Russian in the Crimea; and with the Bulgarian, Servian, and Romaic in European Turkey. The government of Caucasus and Astrakan, to the south; of Viatka and Perm, to the north; and of Grodno, to the west, contain Turks. Orenberg is Turk in language: so is Kazan. Tobolsk and Tomsk give us the Turks of Southern, Yakutsk those of Northern Siberia. Dioscurian, Mongolian, Tungús, and Ugrian forms of speech, all come in contact with the Turkish.

In some cases, the Turk has been encroached on; in others it has encroached. In Hungary, it has given way: indeed, as a general rule, it has given way where the language with which it has come in contact has been European. In Siberia, for instance, it yields to the Russian. Where the language is Ugrian, it encroaches. It has most especially encroached on the Samoyed. In consequence of this, the coincidence of Turkish blood with the Turkish language is anything but close. The blood is Turk where the language is Hungarian or Slavonic. The language is Turk where the blood is Ugrian or Mongol.

Notwithstanding the inordinate size of the Turk area, the differences which it presents are but slight. As a general rule, the dialects graduate into each other; and I doubt whether even the extreme forms—provided that the conversation be on a simple subject—are mutually unintelligible.

In respect to the direction in which the Turk language has diffused itself, we may safely say that in the north and west it is intrusive. Except Independent Tartary and Turkestan, there is no spot where Turkish is spoken where it cannot be shown to be exotic. The

claims, however, of Independent and Chinese Turkestan to be considered as the fountain and origin of the Turk language has yet to be examined. These, however, are matters for the ethnologist rather than the philologue.

The name Turk, *totidem literis*, first appears in A.D. 569, when Justin sent an embassy to the *Khan* Zemarchus, whose residence was near the *Ek-tagh ;* the words in italics being Turkish glosses.

Of the Turk of this district, Klaproth gives the following words, taken from Chinese authorities, who refers them to the language of the *T'uk'iü, i. e. Turks.*

English.	T'uk'iü.	Turkish.
Sky	tängri	tängri
House	ui	ui
Helm	t'uk'iü	tekhieh

Black	koro	khara
Old	kori	khari
Wolf	furin	buri.

As the source of these samples is China, it is fair to suppose that they represent a language of the Chinese frontier, *i. e.* one of the most Eastern divisions of the group. It to this that the name Uighur most especially applies; the proper Uighur being the population which most closely came in contact with two of the languages —the Tibetan and Mongol—which lay to the east of it, and approached the third, *i. e.* the Chinese. This is an inference from the fact that, at the present time, a tribe calling itself Ighur speaks Tibetan, and touches the Sok districts of Mongolia.

The Uighur Turks were the first of their stock to use an alphabet, and used it betimes, perhaps as early as the seventh century. The Mantshú alphabet (as has been stated) came from Mongolia; and the Mongolian from the Uighur Turks, the Uighur Turks having taken it from Syria, under the instructions of the Nestorian missionaries.

It is chiefly in its descendants—the Mongol and the Mantshú—that this interesting alphabet survives; since it was replaced by the Arabic when Mahometanism replaced Christianity. Nevertheless, a few samples of it are extant, viz. (1) the *Baktyar Nameh* of the Bodleian; (2, 3) the *Miradzh* and *Tezkirehi Evliyâ* of the *Bibliothèque du Roi;* and (4) *Kaúdatkúbilik* in Vienna. None of these, however, except so far as the alphabet is concerned, are much more than literary curiosities. The first was written A.D. 1434, the second and third A.D. 1436, the fourth, A.D. 1459. The *Miradzh,* a history of the ascension of Mahomet, is a translation from the Arabic; the *Tezkirehi Evliyâ,* or Legend of the Saints, being one from the Persian. The *Baktyar Nameh* is either a translation from the same language, or *rifacciamento.* The *Kaúdatkúbilik,* or *Science of Government,* shows a little more originality—the matter, and perhaps the composition itself, being older than the MS., perhaps as old as A.D. 1069.

The Mogul dynasty was *Tshagatai,* and the Indian descendants of the Great Mogul are of Tshagatai blood. So are many families in Caubul, just as certain families in England are Norman. The family of Timur was Tshagatai; Kokan, or Ferghana, being the district where the Tshagatai language was most especially cultivated. The Persian, however, was in immediate contact with it, and in some of the provinces prevailed over it. Andejan, however, the district of the capital, was so Turk, that "there was no one," writes Baber, "who did not understand the Turki tongue." Asfera and Marghinan were Persian. The languages acted and reacted on each other. Persian models were copied by Tshagatai writers, and Persian works translated by them.

Of the Tshagatai, *eo nomine,* as spoken at the present moment, I have seen no specimens. Nor is this strange. The language spread itself beyond its own boundaries,

and, having found its way into Persia, Afghanistan, and India, became Persian, Indian, or Pushtu.

Theoretically, the main differences between the Tshagatai and Uighur are considerable; and they would be more so if the existing Uighur works were older. But they must be the newest of their class. Were they not all subsequent to the Hegira? subsequent to the introduction of the Arabic alphabet, which must have been used concurrently with the Uighur, and subsequently to the predominance of Persian and Arabic models? The *old* Uighur compositions would have been different, they would have been Christian in creed and Syriac in style. But none such exist. Yet they must have existed, or why the alphabet? Why its extension into Mongolia? *Uighur*, then, as the word has been used, means New Uighur.

But what if the Uighur alphabet, concurrent with the Arabic in the newer Uighur literature, were also concurrent with the Arabic in the earlier Tshagatai? In such a case, the works in question may be Tshagatai—for, it must be remembered, that it is only the *alphabet* which makes them Uighur. Their date is that of the Tshagatai dynasty. If so, the division between the two groups is either artificial or provisional; in which case Uighur means the Turk of Chinese Turkestan, Tshagatai the Turk of Bokhara and Ferghana. However, according to common parlance, the works already enumerated are Uighur. A Uighur alphabet makes a Uighur work. At the same time, it should be added that Davies (though without quoting his authority) especially states that during the period immediately subsequent to their conversion, the Tshagatai made use of the Uighur alphabet.

The Memoirs of Timur, and the Institutes of Timur, though translated from a Persian original, are said to be, in their earliest form, Turkish compositions—the Turk

dialect being the Tshagatai. These earlier forms, however, have yet to be discovered. Ulug Beg, about A.D. 1446, was a Tshagatai poet, as well as a Tshagatai patron of astronomy. His age, it should be observed, is within ten years of that of the Uighur MSS. Then comes Mir Ali Shir, a poet also, whose works, though unedited, are extant. Thirdly, comes the Emperor Baber himself.

The evidence of the Arabic alphabet being used concurrently with the Uighur, is to be found in the MS. of the Koúdat, where there are interlineary glosses and remarks, some in Arabic, some in Persian—all, however, in the ordinary alphabet of the Koran. Now, whether these be as old as the rest of the MS. or not, the reader who wrote them must have been the reader of a work in Uighur.

The *Uzbek* has, to a great extent, replaced the Tshagatai, if, indeed, the two dialects were notably different. Khiva is Uzbek. The dominant populations in Bokhara and Fėrghana are Uzbek—the remainder being Tajik. So it is elsewhere. This means that, except in the parts about Khiva, there is in the Uzbek countries, side by side with the ruling nation, a subordinate population speaking Persian—differing in its numerical proportion to that which speaks according to the country. Thus—

In Khiva, the Uzbek is at its *maximum*.

It preponderates in the parts about Balk.

So it does in Kunduz.

So it does in Huzrut, Imaum, and Khullum.

On the other hand, in Khost, Inderaub, and Taulikhaun, the Tajik element prevails.

In Meimuna, Andkhu, and Shibbergaun, the second element, though other than Uzbek, is still Turk, *i. e.* Turcoman.

The *Turcomans* are independent nomads between

Bokhara and the Caspian, bounded on the south by Persia, and on the north by the Uzbeks and Kirghiz.

Whether the *Kirghiz* can be separated from the Turcomans and the Uzbeks by any definite line of demarcation, is uncertain. The central portions, however, of their area may be looked upon as the points where the blood and language most closely coincide; where foreign elements and foreign contact are at the *minimum,* and where the type of the group is to be sought. On the east and north the character changes. There is contact with strange languages; those languages being no longer Persian and Tibetan, but the Ugrian and Russian of Siberia. That the Kirghiz of the northern portion of their area are intrusive is certain, though it is difficult to give the exact boundaries of their original occupancy.

The name deserves notice. In Menander's account of his embassy to the Turk king Dizabulus, whose sovereignty seems to have lain in the Tshagatai district, we find the word *Χερχις*—a Kirghiz female slave being one of the presents. In the Chinese geógraphers, Kilikiszu are placed on the Yenisey, where the term is current at the present time. Finally, I believe that, word for word, Kirghiz is Tsherkess, *i. e.* Circassian. The Kirghiz of Pamer are on the Persian and Uzbek frontier.

The Barabinski, Baraba, or *Barama Turks,* between the Obi and the Irtish, touch the Ostiaks on the north, and are probably the occupants of an originally Ostiak area. At any rate, their language is Turk, the soil Ugrian, their blood, in all probability, mixed. Their political relations are Russian, and their creed Shamanism, or imperfect Christianity rather than Mahometanism.

Like the Barabinski, the so-called *Tartars of Tobolsk* are Turks ; occupants of ground originally Ugrian, and so far as it is not Russian, Ostiak.

The Verkho-Tomski tribes. — *Verkho* means *upper,* and is a Russian word. Hence, the Verkho-Tomski are the Turks of the Upper Tom, *i. e.* the Tom above Kuznetsk.

The Abintsi are a part of them. Their dialect, probably, graduates into that of

Kuznetz, where the frontier is Mongol and Samoyed.

The *Teleut* are believed to be Mongols in blood, though Turk in speech. Below Kuznetsk

The tribes of the *Tshulim,* though occupants of a district originally Ugrian, are said to mix Mongol (? Yeniseian) words with their vernacular Turkish. Their tribes are called Dyon or Yon.

The Turkish of the Yenisey, especially in the circle of the Minusinsk, and in the Sayanian mountains, is spoken by individuals who seem to have adopted it after the abandonment, not only of some native language other than Turk, but after the adoption of some intermediate one, different from both the Turk and the original mother-tongue. Thus, a language which will be noticed in sequel under the name of Yeniseian, seems to have been replaced by the Samoyed, the Samoyed itself having been replaced by the Turk. Phenomena of this kind make the parts about Minusinsk one of the most obscure areas in Asia. We may advantageously consider these strata and substrata of languages in detail.

1. There is the Russian—recent in origin, but encroaching upon even the Turk.

2. There is the Turk, which has spread itself in the west, at least, at the expense of the Ugrian, and which, in its Barabinski, Tobolski, and Tshulim elements, so far as it is heterogeneous, is Ugrian.

3. There is the Mongol, which on the Tom, and in the Teleut districts may have preceded the Turk, itself preceded by something Samoyed or Yeniseian.

4. There is the Ostiak of the Obi—the language which best represents the Ugrian of the Kirghiz frontier.

5. There is the Samoyed, spoken as far north as the Arctic Sea, and as far south as the parts about Lake Ubsa within the Chinese frontier—the Samoyed which, in some cases, has been replaced by the Mongol, itself replaced by the Turk.

6. There is the Yeniseian—a language known only in fragments, but which, in one case at least, has been replaced by Samoyed.

Respecting the Teleuts, it has already been suggested that though Turk in language, they have generally been looked upon as Mongols in blood: and it has also been suggested that, in the way of blood, they may be less Mongol than Yeniseian. The Mongol name is Teleng-*gut*, as has already been stated; whereas Abulgazi calls them *Uriat*, which, word for word, is *Urianchai*, *Yarang*, and the like—all apparent derivatives of *Ara*. At the time of the Russian conquest they were called White Kalmuks.

Water	sux		

The *Soiony* (Tshitshatsheff takes pains to tell us that this is the right form of the word) are chiefly within the Chinese frontier. Still some are Russian. Their original language I hold to be Yeniseian; yet, now, they speak Turkish. In Castrèn, as *obiter dicta*, and as illustrations of his Koibal and Karagas vocabulary we have a few Soyony words. They are the tribes from whom the Sayanian range takes its name. Some of the Soyony, as here stated, speak Turkish; others Buriat; some, probably, Samoyed. The basis, however, seems to be Yeniseian.

The Sayanian tribes, one of which is said to be named Sokha, lead to the *Sokhalar* of the Lena and the Arctic Sea, the Turks of the extreme north, the Turks who are usually called *Yakuts;* but whose native names must be carefully remembered as Sokhalar—*lar* being the sign of the plural number. The Sokhalar, from the parts about Lake Baikal, are said to have separated from the Brath (? Buriats), with whom they formerly made one nation, under a chief named Tarkhantegin; the land upon which they intruded themselves having been Samoyed, Tungús, and Yukahiri.

The language of the third column of the following table is from the Asia Polyglotta. It is simply headed *Yeniseian*, i. e. *Turk of the Yenisey.*

Such are the details of the Turks of Siberia, who are so far exceptional as to be, to a great extent, Pagans, rather than Mahometans, and, of course, unlettered. Since the Russian conquest of Siberia, Christianity has made some way amongst them. There is, however, some Mahometanism, and a little Buddhism.

The Turks of the Khanats of *Kazan*, Astrakan, and the Crimea now claim notice. They are all intrusive, *i. e.* other than aboriginal to the countries where their language is spoken.

The *Bashkirs*, chiefly occupants of the Government of Orenburg, Turk in tongue, are, more or less, Ugrian in blood. So are, probably,

The *Meshtsheriaks*, who are believed to have immigrated from the Oka, in the Mordvin and Tsherimiss neighbourhood.

Of the following Pater-nosters, all of which are taken from the Mithridates, the first three represent the language of the parts to the north of the Caucasus or to the east of the Caspian, *i. e.* the Tartar of Independent Tartary. The last three, on the other hand, give the Turkish of Asia Minor. The first of them is from Georgiewicz, who, in the sixteenth century, lived thirteen years in Anatolia as a slave. The second is the Turkish of Armenia; the third, like the first, of Anatolia; its date being A.D. 1666—earlier than the Armenian specimen, but later than that by Georgiewicz.—*De Turcarum Moribus, Lyons*, A.D. 1555. They are given, *verbatim et literatim*, as they stand in Adelung, *i. e.* they have not been collated with the originals.

1.

Atha vizum, ki kok-ta sen; evlia ol dur senung ad-ung; kelsen memleket-ung; olsun senung iradat-ungale jer-dahi gug-de; ver visum gundelik et-mege-muzi bu-giun; va vizum jasu-ngisch kail ot-nitegim kail biz juz jasun-gisleru muze; dahi koima bilzi visvasije; killa kurta vilzi jeman-dan. Amen.

Amen.

In the Government of Kazan reside as many as 300,000 *Tshuvashes*, differing from the other Ugrian populations in their somewhat superior civilization, and from the so-called Tartars in the fact of their being Christians rather than Mahometans. Respecting their language much has been written; some inquirers maintaining that it is essentially Ugrian upon which a great deal of Turk has been engrafted; others that it is Turk at bottom, but Ugrian in respect to its superadded elements.

The Tshuvash plurals end in *-zam* or *-zem*; the Osmanli in *-lar*, or *-ler*. In Tshuvash *ap*, or *ab*, in Osmanli, *men* = *I*. The Tshuvash verb substantive is *bolab* = *sum*; the negative, *-ast-*; as *kazariadip* = *oro*; *kaziarmastap* = *non oro*.

Schubert reckoned the Tshuvash at 370,000; a high number for a Ugrian, or even a Turk, population in these parts.

The Pater-nosters of the preceding pages were taken down before the grammatical structure of the dialects which they represent was studied. As such, they are, more or less, inaccurate. On the other hand, they are better samples of the average character of the Pater-nosters of rude languages than more accurate compositions would have been.

They show difference rather than likeness: whilst, on the other hand, words like those of our vocabularies show likeness rather than difference. Hence, we get, as a rough rule, the doctrine that, in the present work, languages are more like each other than the Pater-nosters make them, and less like each other than the lists of words make them.

CHAPTER XVI.

The Yukahiri.

DUE east of the Sokhalar lie the Yukahiri, or Yukagiri, who call themselves Andon Domni—Yukahiri being the Turk, and Atal the Koriak, name. "Their language," writes Klaproth, is "one of the most outlying in Asia." It is one, too, of which next to nothing is known. It is, also, a language of a receding frontier. In A.D. 1739 the numbers of the Yukahiri were high. The tribes of the Omolon, according to Sauer, were called Tsheltiere; those of the Alasey, Omoki; those of the Anadyr, Tshuvantsi and Kudinsi. A numerous tribe named Konghini occupied the Kolyma. "Wars," writes Prichard, "with the Tshuktshi and Koriaks have almost exterminated them."

But there must (if the views of the present writer be correct) have, also, been encroachment from the West—effected, most probably, by the Sokhalar.

The language is certainly very different from that of any of the surrounding populations.

The root *malhi*, in the Yukahiri numerals for *six* and *eight*, is the *malhuk* (*malguk*) = *two* of several of the dialects of North-west America; and I may add, that, East of the Lena true American characteristics present themselves, and that prominently.

In 1850, I published, in my work on the Varieties of Man, the following tables, one of which gave a certain number of affinities between the Yeniseian and the Yukahiri, the other some between the Yeniseian and the Samoyed. I also expressed the opinion that, on the strength of these affinities, the three groups might be thrown into one, and that the name of the class thus formed may be Hyperborean. Whether the tables were sufficient to justify the formation of such a class is another question. They ought to have been fuller.

It is clear that, if Castrèn's association of the Samoyed with the Fin be (as it is) right, the Yukahiri and

Yeniseian should be in the same category, and, as such, Ugrian also. Does Castrèn make them so? The answer to this question is as follows:—

Of the Yukahiri he says little or nothing any way.

Of the Yeniseian he expressly states that it *is other than Ugrian.*

An opinion to this effect and from such a quarter rendered a re-consideration of the doctrine involved in the previous classification imperative; and so sensible was I of this that, having published a notice of the tribes under consideration between the publication of the *Lectures on the Altaic family*, and the *Grammar of the Kott and Yeniseian*, "in deference to his" (Castrèn's) "opinion, I suspended my judgment until the last-named work should be published."

When published, as it was soon after, it put the Yeniseian as it stands in the present work—leaving the Yukahiri to be dealt with as it best may.

In Sauer's account of Billing's Expedition there is a list of 250 Yukahiri words. These, in conjunction with the list of Imperial Vocabularies, and a Pater-noster from Witsen's North and East Tartary, constitute the whole of our *data.* The greater part of them appears in the *Asia Polyglotta;* in the body of the work by itself, and in the Atlas in a tabular form, compared or contrasted with the Koriak, Kamskadale, and Eskimo languages; from all of which (as aforesaid) it differs visibly.

How far is it Samoyed—the Pater-nosters being compared? The following are the details, clause for clause.

(1.)

Yukahiri.—Otjè mitsje.
Turukhansk Samoyed.—Modi Jescje.
Tawgi Samoyed.—Mi Jeseme.
Archangel Samoyed.—Mani Nisal.
Ostiak.—Jez mi.
Vogul.—Mem Jef.

(2.)

Yukahiri.—Kandi Kudsjunga.
Turukhansk Samoyed.—Teio na Csonaar.
Tawgi Samoyed.—Neiteio Nuontone.
Archangel Samoyed.—Huien tämuvä Numilembarti tosu.
Ostiak.—Kundina jejand Nopkon.
Vogul.—Conboge Eterdarum.

(3.)

Yukahiri.—Temlälängh nim totliè.
Turukhansk Samoyed.—Todi nilo torcke csuzuiro.
Tawgi Samoyed.—Tonon nilo tontokui kusiuro.
Archangel Samoyed.—Tadisse pider nim.
Ostiak.—Nuni nip tät.
Vogul.—Naerderoin amut nema.

(4.)

Yukahiri.—Legatei pugandallanpoh tottliè.
Turukhansk Samoyed.—Todi naksiaro toretusu.
Tawgi Samoyed.—Tonon nuontomeiro tondo tuifantu.
Archangel Samoyed.—Pider parowadie tosu.
Ostiak.—Tule nutkotsj tät.
Vogul.—Nerosia sochtos.

(5.)

Yukahiri.—Lätiot t'sjemol alkatei, konda koet zjuga (? kundsjunga) je leviangh.
Turukhansk Samoyed.—Todi agnaara toretusu tone na csonaar i jacsona.
Tawgi Samoyed.—Tonon nianzepsialo tuifano, tondone nuontono mamorutono.
Archangel Samoyed.—Pider gior amgade numilembart, tarem jae.
Ostiak.—Tät tenel tät tät nopkon its jots jogodt.
Vogul.—Omut nun gerae tegali eterdarum scinan maanki.

(6.)

Yukahiri.—Lünliangel miltjè monidetjeläh keyck mitin telaman.
Turukhansk Samoyed.—Modi puieresiudara kirva toratsin mena ereksone.
Tawgi Samoyed.—Mi niliusiame kirvu tozu nanc jele.
Archangel Samoyed.—Man jeeltema nan tuda.
Ostiak.—Nai me 'tsjelelemi tallet meko shek titap.
Vogul.—Candalas tep mi me tiegalgad.

(7.)

Yukahiri.—Jeponkatsj mitin taldelpon mitläpul, mitkondan (? mit kondan) poniatsjock tannevinol mitlapül.
Turukhansk Samoyed.—I kai nene noina oteine, tone imodinani kalodie neine oteoponede.
Tawgi Samoyed.—Kuoje nane mogorene oteine, tondone oniede kuvojefantome naine oteaoponteinianan.

Archangel Samoyed.—Ali ona mani isai, tai mano wangundar mani mi manuo.

Ostiak.—Kvodtsjedi mekosjek kolzja mei, tät mei kvodtsjedi kolzja mei.

Vogul.—Julokults me gavorant, tuigali menik julgoli amut tzagaraldin.

(8.)

Yukahiri.—Je kondo olgoniläk mitel olo oimik.

Turukhansk Samoyed.—Iro sirene ta ora basiedo.

Tawgi Samoyed.—Letancto men koli cakento.

Archangel Samoyed.—Ja merum hanna sa neninde baka.

Ostiak.—Nik jegosjid kvondik mat kekend.

Vogul.—An mengolen julvagarias.

(9.)

Yukahiri.—Kondo moliak mitel kimda annelan.

Turukhansk Samoyed.—I role sireno kodago choro.

Tawgi Samoyed.—Si lupto men muzcy logoto.

Archangel Samoyed.—Japtan mane suadera.

Ostiak.—Tät . . . mat losogod.

Vogul.—Toromalt derku mem kul.

(10.)

Yukahiri.—Le dot pugundal lenpoh, je tonbank, je tändalov kundejank.

Turukhansk Samoyed.—Tone todi tonea naksiaro i nichoro i su vuraaro i reine.

Tawgi Samoyed.—Tondo tonon noncinu nu ontomouro ni chomeon ni timeon nlecneeno.

Archangel Samoyed.—Tekindapt schin pider parowadea ni hooka, wadado, il iwan.

Ostiak.—Tat tät nudkotsj, orup, uvorganin, tam nun. Nat.

Vogul.—Tagolodamu negotsku, vaan booter, nemonsoigi nekostatiu. Peitse.

Remarks.

1.

Otje is, apparently, the Russian *otets*, *otce*. That *mitsje* is the Turukhansk *modi* is probable. Compare *totlié* (*thine*) with *todi*, and the probability increases.

2.

Kandi is the relative pronoun, and, word for word, the Ostiak *kundina*.

3–4.

Nim is German. *Totlié* has already been noticed.

5.

Latiot.—What *la* means is uncertain. Perhaps it should be separated from *tiot*, which is *totlié* = *thy*. *T'sjemol* is, perhaps, the Ostiak *tenel*. In *leviangh*, the *-ngh* is inflexional, probably the sign of a locative case. The simple form in Billing is *levjie*.

6.

Miltje and *mitin* are the pronouns of the first person. *Monidetjelah* and *telaman* = *this day* and *daily*. The root is *tel;* and it appears in both the Samoyed and Ostiak. It appears, too, with the terminations *-ma* and *-mi*. In Billing, *pondscherka* = *day*, whilst *pondscherkoma* = *to-day*, the *ma* being *man*.

7–10.

The likeness here seems limited to the roots *pon* and *tan*, in No. 7, as compared with the Otea*ponteini*anan of the Tawgi.

CHAPTER XVII.

The Ugrian Class.—Its Importance and Peculiarities.—Castrèn's Researches.—The Samoyed Division.

EVERY language is, in its way, a philological study; and so is every group of languages. The Ugrian class, however, is one of pre-eminent importance. It is the most northern of all: and, in remembering this, we must also remember that the world is a sphere. It is like an apple or an orange. Now it is one thing to cut round an apple in the latitude of its pips: it is another thing to do so just below its calyx, or just above the stalk. The one section is a long, the other a short, one. A language (if such a one existed) that went round the world at the equator would cover infinitely more ground than one that encircled one of the Poles. Yet the number of degrees would be the same. The Malay tongues are spoken over fewer degrees of latitude than the Ugrian. How different, however, is the real length of their area. If they were spoken within the Arctic Circle, they would cover less ground than the Turk. Now the Ugrian tongues belong to the region where the degrees of latitude are of the narrowest. Some of them, indeed, lie to the south—*e. g.* the Magyar. As a general rule, however, they are northern.

Again—there are certain parallels which may be called zones of conquest and encroachment. The extreme north is unfavorable to the development of mind and muscle. So are the Tropics. Hence, the nations of the medium, or temperate, districts are like two-edged

swords. They cut both ways—encroaching accordingly.

The Ugrian tongues are the tongues of the North, of the narrow longitudes, and of the unfavoured climates. They have been inordinately encroached on. Again—they lie, to a great extent, between Europe and Asia.

The Ugrian area was once continuous. It is now fragmentary. Many of the Ugrian districts are islands, with a sea of Slavonism around them. Or we may change the metaphor, and call them oases. The desert around them is sometimes Slavonic, sometimes Turk.

The Tungús, the Mongol, and the Turk were philological classes in the way that the Solidungula constituted a class in Zoology. The difference between the horse and the ass was all the difference they embraced. The Ugrian is a class in the way that the Rodentia are a class. There are many members, and the differences embraced are the differences between a mouse and an agouti.

The chief languages of the Ugrian class are the Ostiak, the Vogul, the Magyar, the Permian, the Votiak, the Tsherimis, and the Mordwin—all recognized by the earlier philologues. Then comes the Samoyed, recognized as Ugrian since the researches of Castrèn. Then the Yukahiri and the (?) Yeniseian, of which much has already been said.

The Koriak and its congeners can only be made Ugrian by raising the value of the class.

In three respects Ugrian philology is easy. A language spoken in the centre of Asia has affinities on each side—north, south, east, and west. A language spoken on the northern end of the world has affinities in one direction only—to the south. The affinities of the Lap are one-sided; those of the Turk (to borrow an expression from the geologists) quaquaversal.

Secondly—the boundaries of an island or an oasis are easily marked out. The limits of a tract in the

middle of a continent may easily be indefinite. Now, many of the Ugrian tongues are absolutely isolated.

Thirdly—the Ugrians have generally been encroached on. Hence, there is much which, though Russian, Lithuanic, German, or Turkish in speech, is Ugrian in blood; although the converse is (comparatively speaking) rarely the case.

There are not ten millions of Ugrians (tested by their language) in the world. Of these nearly half are in Hungary; three-fourths of the remainder being the Fins of Finland. Assuredly, the Ugrian is a fragmentary class.

The Ugrians lead not only from Asia to Europe, but to America as well.

The *data* for the Ugrian languages are ample. This is because the nationality of the Finlanders, not discouraged by Russia, has been devoted with more than merely laudable activity to the study of them. From the days of Porthan to those of Sjogrèn and Castrèn, the investigation of Ugrian ethnology has been pursued with learning and acumen.

The language of the present group which is best known, and which most especially illustrates the word *Fin* or *Ugrian* (for the two terms are nearly synonymous), is the Fin of Finland. As a literary language it is, by no means, unimportant. Neither is it the language of a nation destitute of political importance. Still it is not the right language to begin with. It is part and parcel of the present work to make an approximate sequence in the way of connection: and the group of prospective languages which comes nearest to the preceding is—

The *Samoyed:* this being a name for a class of dialects which, within the last ten years, has commanded more attention than any class of equal political and literary unimportance. Yet fifty years ago they were known only by name. The Mithridates gives us little

more than a few Pater-nosters. The *Asia Polyglotta*, by means of the Vocabularies of Strahlenberg and Messerschmidt, gave us fuller materials. Nor were they neglected. Klaproth, who spared so few that few have cared to spare him, has got less credit than he deserves for the amount of arrangement which he introduced amongst them. Castrèn has been hard upon his errors; —perhaps unduly so: but when men deal in hard measures towards others, hard measures is all they can expect for themselves. I find no notable and really material differences between his divisions and Castrèn's—no notable and really material ones. Some, however, exist; though unimportant. As for Castrèn's own, I take them as I find them; seeing plainly that they are made on the principle of demarcation rather than type; and (as such) only provisional. How far they are based upon single characters rather than upon a multiplicity of characters in mass, the incomplete state of his Grammar and Dictionary (both of which are posthumous works, with little or no original matter added by the able editor) prevents me from ascertaining.

The first fact connected with the class is the vast style of its area both in respect to latitude and longitude. The first Samoyeds are found as far west as the neighbourhood of Mezen; the last on the banks of the Chatunga. Considering, however, their Arctic locality, this is nothing very extraordinary. The degrees of latitude in the neighbourhood of the Icy Sea are narrow. Much more interesting is the *extension southward*, or the fact of their being found so low as 50° N.L. within the Chinese frontier. Of these southern Samoyeds there are two divisions; one on the upper, or middle, Obi; one on the upper, or middle, Yenisey. Between the two there is this difference—the Samoyed area of the Obi is either nearly, or wholly, continuous; in other words there is a chain of Samoyed localities which, either nearly or wholly, continues the chain of

dialects from the Barabinski steppe to the mouth of the river. The Samoyeds, however, of the upper Yenisey are utterly isolated. They are found on the Yenisey where it is cut by the Russian and Chinese boundary, and they are not found again until we approach its mouth.

In many respects these South-eastern Samoyeds (the simple term Southern is insufficient) are the more important members of the class. In the first place, it is likely that they represent the occupants of the original *situs* of the family: so that it spread from south to north rather than from north to south. This, however, is a matter which requires more consideration than it has received. Neither is it a doctrine to which the writer commits himself without reserve and conditions. In the next place, it is in the south that the Samoyed has been (what we are scarcely prepared to expect) an encroaching language.

Who would unlearn his own mother-tongue for the Samoyed? Not the Turks, not the Mongols, scarcely the Tungús—though it is possible that certain tribes belonging to some (or all) of these divisions may have done so to some slight extent. The populations which have most especially, either by amalgamation or conquest, allowed their own language to be replaced by the Samoyed are the Yeniseians of the Kot and Ara divisions. This, however, we have already seen. On the other hand, the Samoyed, (in some cases as pure Samoyed, in others as Samoyed which has superseded the Yeniseian,) is, itself, replaced by the Turk; as we saw when speaking of the Koibal and Karagas, and as we suggested when speaking of the Tuba and other dialects. Probably, also, certain Tungús and Buriats are Samoyed in blood though other than Samoyed in speech. Of the Turk language, however, in Samoyed mouths, there is no doubt.

Its encroachment is recent. In the *Asia Polyglotta* there are two Vocabularies; one headed Motorian, representing the language of the Matar, Matlar, or Matorzi,

and one headed Koibal. Both these were collected by Messerschmidt, in the last century. The Motorian Samoyed, *then* nearly extinct, is now no longer to be found —at least *eo nomine.* The Koibal may possibly be spoken by a few individuals. Still, the Koibal of the Koibal Grammar of Castrèn is simply Turkish. The Kamas, the third of Klaproth's (or Messerschmidt's) Vocabularies, is still spoken; and Castrèn has given us a Grammar of it. Still the main language of the division is Turkish — with the exception of a *minimum* of Kot. There *may* be a Soiot form of the Samoyed; though this, if it exist, is, probably, Samoyed in the mouth of Yeniseians. The few words, however, that we know of the Soiot are Turk. Still the details of the country within the Chinese frontier are most imperfectly known. On the part of the Northern Samoyeds, the philological encroachment has been less. Still there have been encroachments. Castrèn writes that some of the frontier Ostiaks have learned to speak Samoyed.

Of the *Northern* Samoyeds the chief divisions, according to Castrèn, who founds them upon the differences of dialect, are three; (1), the Yurak; (2), the Tawgi; and (3), the Ostiak.

(1.) The Yurak Samoyeds are those that lie in the closest contact with the Russians. To them the name Samoyed was first applied. It is a name which is, by no means, native. The native name is *Kasovo* (*Hasawayo*), or *Nyenets* = *man.*

The Yurak Samoyeds, or the Samoyeds of Yugoria, appear on the eastern coast of the White Sea, towards the mouth of the river Mezene. On the lower course of the Petshora they are more abundant still. They are separated from the Russian Laplanders by the White Sea and by the valley of the Dwina; for the parts about Archangel have long been wrested from them and Russianized.

Between the Petshora and the Ural, the Samoyed is

bounded on the south by the Zirianian area. On the Obi he comes in contact with the Ostiak; and that at the very mouth of the river. In the parts, however, about Obdorsk Samoyed is spoken. From the Obi to the Tas all is Yurak Samoyed. On the Tas, however, there is a break; beyond which the details are obscure. The Yurak division is generally carried as far east as the Yenisey. We will here, however, carry it to the Tas.

The Yurak Proper is only one dialect out of five; the other four being represented by the (*a*), Kanin and Timan; (*b*), the Ishim; (*c*), the Bolshizemla and Obdorsk; (*d*), and the Kondin, or Kazym, forms of speech.

(2.) The Tawgi division reaches from the lower Yenisey to the Chatunga; the tribes which belong to it being sometimes called the Avam, or Avamski, Samoyeds.

(3.) The Ostiak Samoyeds have the disadvantage of being described by an inconvenient name. The true Ostiaks are something else, as has been seen.

Of their dialects, however, *in situ*, the most northern is that of the parts about the Tym and Narym; next comes that of the river Ket; thirdly, that of the Tshulim. The Ket forms of speech extend as far as the rivers Parabel and Tshaya, feeders of the Obi, on the frontier of the Barabinski steppe. The dialect of the Circle of Pumpokolsk is also akin to the Ket.

The migrations are represented by the Karasin and Tas forms of speech; the former being spoken in the parts to the north of Turukansk, on the Yenisey, and the latter by the Tym and Karakon tribes of the Tas; tribes that use the reindeer and call themselves Mokase.

In the way of language, the Kamash, Kamas, Kangmash, or Kamasintzi (the Motorian and Koibal being extinct), are the only existing representatives of the *Southern* Samoyeds. They are Nomads and Shamanist pagans, on the head-waters of the Kan and Mana.

From one division of them Castrèn got the materials for his Grammar.

I have said that between the groups of Klaproth and Castrèn there were some differences of detail. Klaproth lays the Tawgi in the same class with the Yurak; along with which he places the Pustosersk, the Obdorsk, the Mangaseia, and the Turukansk dialects. His second class contains the Tas, Tomsk, Narym, Ket, Tym, and Karas forms of speech, along with a short specimen of what he calls the Lak. Finally, a list headed *Taigi* (the import of which is not explained), finds place in the third division, containing the Motorian, the Koibal, and the Kamash.

Even in Castrèn the details and value of a fourth section called (most inconveniently) the Yeniseian, are obscure. The class itself is small. Its name gives the locality of its members. They lie between the Yurak and Tawgi divisions on the lower Yenisey.

It is from Castrèn that all the following specimens are taken, and it is in the orthography of his Samoyed Grammar and Dictionary that they are given.

A.

NORTHERN SAMOYED.

Bone	le	*Fish*	kola
Sun	kuya	*Dog*	men

The Yurak Samoyeds call themselves *Hâsawayo = men;* the Tawgi and Yeniseian Samoyeds call them *Juraka* and *Julaka;* the Samoyeds of the Obi, *Köelak, Kwälak,* and *Kwäleng.* Meanwhile the Yurak call the Ostiaks *Habi.* It is the Yeniseian Samoyeds who give to the great river on which they are fixed the name which nearest approaches its European one. They call it *Yeddosi.* The Tawgi call it *Yentayea.* The Obi Samoyeds, on the other hand, know it as the *Nyandesi,* the *Kola* (*= river*), and the *Tyagandes Kola = broad river.*

CHAPTER XVIII.

The Ugrian Class.—The Ostiak, the Vogul, and the Magyar.

THE *Ostiak* is the language of the Obi and Irtish on the drainage of which it is spoken from about 56° to 67° N.L. I am not aware that it touches any part of the water-system of the Yenisey; though certain tribes belonging to the Samoyed and Yeniseian groups have improperly been called Ostiak. This inaccuracy, with which Klaproth and others found it necessary to contend, is now unimportant. The latest authorities, when they have not discarded the term altogether, have, in general, warned the reader of its impropriety. So influential a writer, however, as Castrèn still applies the term Yeniseian Ostiak to a form of speech which, whatever else it may be, is certainly different from the dialects under notice.

These belong, as has just been stated, more especially to the Obi and the Irtish, where they are bounded on the south by the Barabinski and Tshulim Turks, on the west by the Voguls and Zirianians, on the north by the Samoyeds of the Icy Sea, and on the east by other Samoyeds, and the Yeniseians of the Ket. In 1838 the number of Ostiaks was about 19,000. Narym, Surgut, Beresov, and Obdorsk are the towns which lie most especially on the Ostiak frontier.

The only Grammar of the Ostiak is one by Castrèn, in which, contrary to his ordinary habit, he has represented the language in Russian, rather than Italian, letters—Russian as adapted by Sjögren to the Iron. The dialect is that of the Irtish; besides which there

are, at least two others on the Obi, viz: the Surgut and the Obdorsk. The former falls into sub-dialects; at any rate certain words are quoted as belonging to the upper Surgut, or the Surgut of the river above, and others as belonging to the lower Surgut, or the Surgut of the river below, the city.

That the language of a nation of fishers and foresters should be uncultivated and unlettered is what we both expect and find. That it has been largely superseded by the Barabinski and Tshulim Turk is probable. That certain Ostiaks of the Samoyed boundary have exchanged their mother-tongue for that of their frontagers is especially stated by Castrèn.

The Ostiaks call the river Obi *As*.

The *As-yakh*=*Men* of the *As*=*A*sicolæ, or *Ob*icolæ, call

The Ostiaks of the Demianka, *Tshonto-yakh*.
——————— Irtysh, *Long-gol-yakh*.
——————— other rivers, *Nang-wanda-yakh*.

Narym, and the banks of the river Ket, are the most eastern points of the Ostiak occupancy; and there the Ostiaks come in contact with the Samoyeds. Now the term for *man* changes here, and is—

In the singular number, *kup* = *homo*.
—— plural ——— *kula* = *homines*.

Hence the compound Gentile names end differently, and a Narym Ostiak calls

Himself . . . *Dshumul-kula*.
The Surgut Ostiaks . *Tangyl-kula*.
— Russians . . *Ruzhil-kula*.
— Turks in general . *Tül-kula*.
——— of the Tshulim *Tshulim-ku-kula*.
— Tungúsians . . *Guellon-kula*.
——— of the river Obi *Koldy*.
——————— Tym *Kasükh-kü*.

The Asjakh of Surgut call themselves *Naxta-yakh.*
——————— the Ostiaks of *Narym Nyorum-yakh.*
——————— Samoyeds *Yeryan-yakh.*
——————— Turks . *Katan-yakh.*
——————— Russians *Rutsh-yakh.*
——————— Germans *Nimet-yakh.*

Word for word, *Njorum*=*Narym*,=*fen*; and, as a Ugrian gloss, it is an instrument of criticism. Where the root *n-r-m* and a swampy locality go together, we have a presumption in favour of either a Ugrian occupancy or a Ugrian neighbourhood.

The *Vogul* language belongs to the ridge of the Urals and to its two sides; being spoken by about 900 individuals in the Government of Perm, and 5000 in that of Tobolsk, a few of whom are tillers of the soil, the majority being fishers and hunters. It is the only Ugrian language of which we have no Grammar; indeed, it is the one which, upon the whole, has commanded the least attention. The Vocabularies, however, are sufficient to show not only that it is truly Ugrian, but that it belongs to the same class with the one which now comes under notice.

Ten	iyani	——

The Voguls hold a cheerless and inhospitable tract of land bounded by the Zirianians, the Samoyeds, and the Kondicho, whom *Voguls* call by the name they give themselves, viz. *Mansi.*

In the south part of the Vogul country Christianity has advanced a little; feebly and imperfectly, but still a little. In the north, paganism prevails.

The Voguls call the Irtish . *Shap.*
—— Tawda . *Tagget.*
—— Konda . *Khonda.*

How far the Ostiak and Vogul extended southwards before the encroachment of the Turks is unknown. Neither is it known whether their extension was easterly or westerly. The opinion of the closest investigators, amongst whom may be placed Castrèn, is in favour of their having extended themselves bodily from the south. Be this as it may, the Government of Orenburg, though at present the chief occupancy of the Bashkirs, was originally Ugrian. More than this, its Ugrian elements, though not exactly either Ostiak or Vogul, were closely akin to both. In Orenburg, however, no one, at the present moment, uses the original language. It is spoken nevertheless. It is spoken elsewhere; far to the south and far to the west of its original locality. It is

spoken by more individuals than any Ugrian tongue whatever; indeed, by more than all the speakers of all the Ugrian tongues put together. It is the language of no less than 4,000,000 Hungarians, the native name of whom is *Magyar*.

Magyar, then, is the term by which we denote the descendants of those Ugrians who, in the tenth century, cut their way from the ridge of the Ural and the streams of the Yaik to the rich pastures and fertile tilths of Hungary, as opposed to the Slavonians, Rumanyos, and Germans of that kingdom; and Magyar is the name of the language as well as the people. The time when it was introduced into Europe is one of which the history is too obscure to allow us to give the exact details of the languages which it displaced. Thus much, however, is certain, viz.: that it came in contact with German on the west, with Rumanyo in the east, and with Slavonic forms of speech on every side; besides which there were the dialects which it actually displaced, the majority of which, I believe to have been Turkish.

As the first Magyar Christians were converts to the Latin rather than the Greek Church, their alphabet is Roman, so that the history of their civilization and literature is that of Poland and Bohemia rather than Servia and Bulgaria; indeed, Poland and Hungary are the two countries where the Latin, from its inordinate use as the language of law, religion, and learning, has made the nearest approach to an actual vernacular without becoming one.

The early works in Magyar were few and far between. Neither were they important. In a bibliographical list of all the compositions in Magyar, printed in 1803, the total number of works referred to the year 1784 (a date of which the importance will soon appear) amounted to no more than 29: the majority of which consisted of funeral sermons. Amongst the most important ones of

the list at large were three translations—one of a forgotten tragedy of Cronegk's, one of Voltaire's *Zaire*, and one of the *Cyropædia*.

The year 1784 was the year of the Emperor Joseph's famous edict by which he attempted to introduce German, as the language of the Diet, the Law Courts, and all public offices. It enacted, *inter alia*, that within three years from that time, unless special circumstances could be adduced which should justify him in allowing a respite, all the cases in all the Courts, whether in first instance or as appeals, were to be conducted in German. This excited universal consternation. The Diet at Presburg resolved that the records of its proceedings should be in Magyar; and that a committee should report on the best means of fostering the study of the native tongue. One of the recommendations of this Committee was the establishment of a national theatre: another was the establishment of an academy. Neither was carried into effect at the time: both bore fruit in the sequel.

The language of the claims thus enforced was the Magyar. The language, however, against which the edict of Joseph was more especially directed was the Latin; for it was the Latin, rather than the Magyar, which had up to then become the language of the laws and the constitution. And, to a great extent, it was the Latin, rather than the Magyar, which was defended. Still, the upshot of the national movement was the development of the Magyar.

The history of the Magyar literature now becomes the personal history of those energetic patriots who availed themselves of the reaction in its favour: first and foremost of whom was Francis Kazinczy. For more than forty years he laboured at the language. I say the language rather than the literature, because his literature was a means rather than an end. It was the language which he wished to improve. The efforts of the Ger-

mans in the same direction were before his eyes; and he claimed for the Magyar the same freedom in dealing with its elementary terms and making new compounds out of them as the Germans were indulging in. He substituted home-made terms for terms of foreign origin. In a language upon which both the Latin and the German had so long exercised what he (as a purist) would consider baleful influence, there was much to be done in this way; yet Kazinczy was not the reformer that was tempted by his opportunities. Some went farther than he did. He was, however, upon the whole successful in his coinage. For *secretary* and *counsellor* he introduced *titoknok*, and *tanacsnot*, from *titok*, a *secret*, and *tanacs* = *counsel*.

With the words ending in *né* the sign of the feminine gender, he dealt more boldly still. They correspond to the German forms in *-inn*, as *freundinn* = *female friend*, to a certain extent only. *Baratné*, from *barat* = *a friend*, meant, up to 1800, not so much *friend* of the female gender as *a friend's wife*. In like manner *kiralyné*, from *kiraly*, a *king*, meant a *king's wife* rather than a *queen* or *female king*. Both these words either changed or enlarged their meaning under the influence of Kazinczy. There was a word for the Latin *virtus* wanted, and there was a competition between Kazinczy and others as to who was to coin it. There was also a prize of fifty florins offered for a native equivalent to *spiritus*; another one for *universum*. These words, though manufactured rather than grown, have kept their place better than was to be expected.

At the same time, the quantity of still-born words in Magyar is very great. No wonder. The births are numerous. In 1845 Dr. Block published a German and Hungarian Lexicon. In 1847 a second edition was wanted, and the whole work had to be recast; so great had been the additions to the language within the last two years. I take this, as Mr. Watts takes it, *i. e.* as a measure of the rate at which innovation goes on; adding

that it is from a paper of Watts' in the Philological Transactions that the whole of the foregoing notice is taken.

The following list of the Fin affinities of the Magyar is picked out of the tables of the *Asia Polyglotta*. By going to other sources it might be largely increased.

English.	Magyar.	Other Ugrian Languages.

The dialects of the Magyar are few and unimportant. They are said to fall into two divisions, divided by the Danube.

NOTE.—The statement made in the previous sheet, that there is no grammar of the *Vogul*, requires correction. There is a very recent one, in *Hungarian.*

CHAPTER XIX.

The Volga Fins.—The Mordvin.—The Tsherimis.

NEXT to the Magyars, and the Finlanders Proper, the Mordvins are the most numerous of the Ugrians. They are the most southern members of the family; the Hungarians, as strangers to their present locality, being laid out of the account. They are also the most western; some being found in the Governments of Tambov and Penza. For this reason, the Mordvin area takes great prominence in all speculations as to the original extent of the Ugrians in the direction of the Euxine and Poland. That they have extended further is a matter of history. That they have extended *very much further* is one of the most reasonable of ethnological opinions.

They fall into three divisions, the Mokshad, the Ersari, and the Karatai; of these, the second has a name sufficiently like that of one of the Turkoman tribes, to be, in all possibility, more or less Turk in blood —though the conjecture rests on only colourable data. The same applies to the Karatai; inasmuch as Karatshai is also a Turk name. The Mokshad give no such complications.

The Mokshad are on the Sura;
— Karatai near Kazan;
— Ersari on the Oka.

In the southern part of the Government of Astrakan some fifty Mordvins constitute an outlying group of (I believe) recent settlers. So do 340 individuals in the Crimea.

The distribution of the others is as follows :—

In Penza . . .	106,025
— Simbirsk . .	98,968
— Saratov . . .	78,010
— Samar . . .	74,910
— Nizhni Novogorod	53,383
— Tambov . . .	48,491
— Kazan	14,867
— Orenburg . . .	5,200

The name *Mordvin* is native, and signifies *man ;* as it does, not only in other Ugrian languages but in certain Persian and Indian dialects also.

The Mordvin, so far as it is written (which is very little), is written in Russian letters ; the Mordvin Christianity being that of the Greek Church.

The Mordvins are far more Russianized than either the Tsherimis or the Votiaks. Their language, too, is one of the most outlying members of its stock.

The Mordvin Grammar of Gabelentz is founded upon a translation of the Gospels ; the alphabet being the Russian. In this the vocalic harmony shows itself but partially. Whether this be due to the language or the author, is doubtful. Gabelentz refers to the latter.

The *Tsherimis* language is spoken by nearly 200,000 individuals, of which nearly three-fourths are inhabitants of the Governments of Viatka and Kazan. The dialects on the two sides of the Volga differ from each other ; and, it is probable, that they fall into sub-dialects ; for the population is sporadic and fragmentary, and the Tsherimis villages stand far apart. The native cultivation of the language amounts to nothing beyond a few songs. The exertions of the missionary have given a Catechism, and a translation of the Gospels—the alphabet being Russian. In Castrèn's Grammar, however, it is Roman, and so it is in Wiedemann's German. There is no reason for believing that any notable number of the

speakers of the Tsherimis language are other than Tsherimis in blood. The converse, however, is far from being the case. Both Turks and Russians may be, more or less, Tsherimis in blood.

As a member of the Ugrian group the Tsherimis is comparatively isolate. Its nearest congeners, I believe to be the Ostiak, Vogul, and Magyar.

The Tsherimis falls into two dialects, divided from each other by the Volga. One has, the other has not, the vocalic harmony. Such, at least, is the statement of Wiedemann. Our *data*, however, are scarcely sufficient to bear out a negative statement.

CHAPTER XX.

The Votiak, Permian and Zirianian.

THE *Votiak* is the Ugrian of the Government of Viatka; in which the circle of Glasov is the chief Votiak locality —then, those of Malmysh, Yelabuga, and Sarapul. Into the Yelabuga dialect the Gospel of St. Matthew, into the Glasov dialect that of St. Mark, has been translated. Many of the Votiaks speak Turk as well as their own language; the Turkish elements being at their maximum in Yelabuga and their minimum in Glasov. In the library of the Bible Society at Viatka is a translation of all the Four Gospels, except a part of St. Luke. Though not without decided Tsherimis elements, the Votiak affinities are less with the languages that have preceded, than with those that are about to follow it; these being

The *Permian* and the *Zirianian;* the former, the Ugrian of Perm; the latter, the Ugrian of Vologda. They are closely allied dialects of one and the same form of speech. The Zirianian section falls into four sub-dialects, three being pretty closely allied to each other, but the fourth being an outlyer, much mixed up with the Samoyed. Nevertheless, somewhat unfortunately for the philologue, it was in the northern, the outlying, and the modified dialect of the Zirianian that the first attempts at a grammar were made. This was Flörov's, published in 1813, the dialect being the Udorian—*i. e.* that for the parts about Udorsk. Since then, the Gospel of St.

Matthew has been translated into the Ustsyssola dialect; probably the purest of the four. Yet, even here we have a great number of Russian words. The other two forms of speech, allied (as aforesaid) to each other and to the Ustsyssola, are the Zirianian of the Upper Vytshegda, and the Zirianian of the Yaren.

The Zirianians have long been converted to the Greek Church; being, along with the Permians, the first of the Eastern Ugrians to whom the Gospel was preached. Their apostle was St. Stephanus.

CHAPTER XXI.

The Fin Proper.—Division into Tavastrian and Karelian.—The Tver Dialect.—The Vod.—The Estonian.

A DISTINCTION, drawn by the native investigators in Fin philology, now requires notice. Whatever may be its real value, it is a distinction upon which much stress is laid. It is that between the *Tavastrians* and the *Karelians.*

The Tavastrians are the Finlanders of the south-west, especially of the parts about Tavastahus, the Karelians, those of the interior; the interior meaning those parts both of the Duchy and of the Government of Olonets which are drained by the Lakes rather than by the Baltic. To either the Tavastrian or the Karelian area belongs the great mass of the Fins of Finland.

But besides these, and besides the Ugrians of Estonia, of whom more will be said in the sequel, there are several sporadic populations, lying like islands in the midst of a Russian population, sometimes forming an imperfect connection with the Ugrians to the south of the Gulf of Finland, and sometimes absolutely detached, of which the ethnological history has been investigated. Some of these are recent settlers: others the representatives of an original population which was once Ugrian, but is now Slavonic. To separate the old from the new has been one of the objects of the native inquirers. To separate the Karelian from the Tavastrian has been another.

Again—the names Fin and Finland are anything but

native. The nearest approach to a general name is Suomelaini (in the plural Suomelaiset) a word which means the men of the fen, morass, or swamp. Word for word it is the Sabme of the Laps; a name which will soon re-appear. Suomelaiset, however, is only an approach to a general name. The Quains are Kainulaiset, and the Karelians Kirialaiset. A third division is Hämalaiset. Now the name Yam is prominent in the history of the early contests between the Slaves and the Ugrians; as the name of a separate section of the Suomelaiset—the Hämalaiset being supposed to coincide with the Tavastrians.

Beyond the proper Fin districts the language of Finland is spoken in Norway, where, in the district of Soloer, on the Glomuen, a Fin settlement, from Sweden, was effected in 1624. The chief Fin parishes are Hof and Grue; where the district is called Finskoven or the Forest of the Fins, and where the settlers amount to about 2000.

The following populations are all, more or less, sporadic, and all held to be recent settlers rather than aborigines, as well as to be Karelian rather than Tavastrian.

1. The Auramoiset of the Government of St. Petersburg —30,000 in number.

2. The Savakot to the number of 43,000.

3. Karelians of—

The Government of	Archangel	11,228
———	Novogorod	27,076
———	St. Petersburg	3,660
———	Tver	84,638
———	Yaroslav	1,283

To which add some in Olonets.

The following is the Parable of the Sower, in the Fin of Tver, contrasted with that of Finland Proper.

Tver.

Ka laksi kulvaa kulvamax; I kulv*i*ässa mulvvénnet uvat langettyx *t*iědavas: i tuldyx linnut ; i g*ï*at nökittyx. Muvvénét langettyx kivi ruŏpahilla kumbaz*i*ěn-p*i*älla vaga oli muădda: i tervax guö novstyx, zen-tax, *e*vldu muassa suvax: Païvazén novstuŏ guö kellissuttix, i kuĭn *e*vldu uurdunuŏt kuĭvéttyx. Muvvénnét langettyx tug'üx i kazvo tug'ü i g*i*at katto. A muvvénnét langettyx huvalla muălla i kazvettyx lizävon-kera, kumbane toĭ suăn kumbane kuŭzikummenda, kumbane kolmekŭmmenda. Kella ollax korvat kuŭlla kuŭlgax.

Fin.

Katso kylwäjä mene kylwämään. Ja hänen kylwäissänsä, lankesiwat muutamat tien oheen, ja linnut tuliwat, ja söiwät ne. Muutamamat taas lankesiwat kiwistöhön, kussa ei heillä ollut paljo maata, ja nousiwat peari päälle, ettei heillä ollut sywää maata. Mutta koska aurinko nousi, niin he pouditti n: ja orjantappurat käwiwät ylös, ja tukahuttiwat ne. Muutamat taas lankesiwat hywään maahan, ja tekiwät hedelmän, mutuama satakertaisen, muutama kuudenkymmenen kertaisen, ja muutama kolmenkymmenen kertaisen. Jollo on korwat kuulla, se kuulkaan.

The Ugrians of the parts to the south of the proper Fin area who pass, and that on good grounds, for aboriginal, are—

1. The Tshud, or Vesp.
2. The Izhor.
3. The Vod.

1. The Tshud or Vesp (15,617) on the bank of the Onega and Bielozero, speak a dialect which is held to be Tavastrian, and which they call Liudin Kiele, *i. e.* Lingua Ludina.

2. The Izhor (17,800) in the Government of St. Petersburg, who call themselves Ingrikot or Ingrians.

3. The Vod, who occupy a few villages in the circles of Yamburg and Oranienbaum, to the number of 15,148, who call themselves Vadjalaine and Vadjalaiset and whose language is the Ves—*tunnet paiattaa Vaihsi = loquerisne Votice.*

What has been written about the division between the Karelian and Tavastrian deserves notice, as a fact in the history of opinion rather than as a fact in language. It is one, however, that must needs be known if we wish

to look at the Fin question from a Fin point of view. I have doubts, however, whether it is more—doubts that, coming from an amateur in London, in opposition to the decided and (I believe) unanimous voice of such competent judges as the native philologues themselves, must be taken at the reader's, rather than the writer's, valuation. I cannot, however, see that the report is borne out by the evidence; admitting, at the same time, that it is very likely that I have not seen the evidence in full. Indeed, it is morally certain that I have not. Still, I see a generalization of great breadth, and along with it probable and particular sources of error—one of which is the love of generalization itself, combined with the fact that in comparative philology it is over-hastily indulged. I think that, *mutatis mutandis*, what the Fins write about Tavastrians and Karelians has been written by Englishmen of equal eminence about the Angles and Saxons; and, as an Englishman, I am well aware that nine-tenths of what is so written is wrong. It is written by able men, nevertheless. At the present moment, Ahlqvist's Grammar of Vod is lying before me; and it fully verifies the statement that, even when we have got our results as to the distribution of the several Fin forms of speech over the two divisions, they are, by no means, decided. The Vod, itself, is a *Yam dialect with Karelian elements.* The written language itself is *more Karelian than is generally believed.* The Ugrian of Ingria is, more or less, Vod. Lastly, the Estonian and Vesps are less Karelian than the rest. Upon the recognition of Karelian elements in the literary Fin, great stress is to be laid; since it is probable that, either consciously or unconsciously, most inquirers have taken it as the standard Tavastrian.

Such are the qualifications. As to the characteristics themselves, they are, to a great extent, arbitrary; at any rate, the evidence to any one of them being the sign of others is wanting. Again—though the details

of the sporadic Fins are numerous, our information as to the local dialects of Finland itself—vast as is its area—are of the scantiest. Lastly, neither the Karelian nor Tavastrian are extreme forms. They may graduate into one another less than the present writer believes them to do.

All this means, that, in the division before us we have a classification by definition, where, in the present state of our knowledge, definition by type is alone practicable.

The earliest specimens of the Fin language are referrible to the fifteenth or sixteenth centuries; amongst which is a Translation of the Psalms by Agricola, Bishop of Abo. It is preceded by a short poem in which the heathen gods and goddesses, in whom a latent belief, notwithstanding the professed Christianity of the country, still existed. The list contains more than twenty names; the majority of which can be found at the present time. Indeed from the time of Bishop Agricola till now, the old Fin mythology has commanded the attention of able inquirers; of Ganander and Porthan, followed by Topelius in the last generation, and Lonrott and Castrèn in the present. Topelius collected more especially the poems which bore upon the history of a particular personage—Wainamoinen; so forming what we may call a Wainamoinen cycle. With this the Fin lays took form, until, from accretion upon accretion, the *Kalevala* was the result. If we look at this remarkable poem in respect to its parts, it is a series of rhapsodies. If we look to it as a whole, it may be dignified by the name of Epic. It is pagan in respect to its machinery and subject-matter, though not without decided Christian elements: indeed, towards the end, the Virgin Mary under the name Marietta, and Herod appear. It should be added, however, that this is in a kind of appendix to the work rather than in the body of the poem itself.

Whatever may be the age of either the oldest or the newest portions of the *Kalevala*, the language is the Fin of the present day.

The Ugrians who occupy *Estonia* are in contact with the Germans and Lets rather than with the Scandinavians. For this reason the foreign influences have been German rather than Swedish. The *Estonian* alphabet is Roman, the religion Protestant. At one time, when all Ingria was Ugrian, the Estonian and Fin populations must have been in contact.

The Estonians call themselves Rahwa, and their country Marahwa, or Rahwa Land; the parts north of the river Salis being their chief area.

In Liefland the Rahwa number . .	355,216
— Estonia . .	252,608
— Vitepsk . .	9,936
— Pskov . .	8,000
— St. Petersburg . .	7,730
	633,490

The Estonian is divided into two main dialects; one with Reval, the other with Dorpat as its centre; so that we hear of the Dorpatian and the Revalian forms of speech as paramount. I believe, however, that almost every parish presents some peculiarities, and I am by no means sure that the distribution of the numerous dialects and sub-dialects thus developed corrresponds with the usual classification.

A love for song and music is exhibited throughout the Rahwa country; and of this we may judge by more than one collection of songs, legends, charms, nursery rhymes, and the like. The harp was the instrument—the harp, or *kandel*. With this the bards, the exact analogues of the Gaelic bards of almost our own days, musical and locomotive, used to wander from place to

place, as the harvest-home, or the wedding-feast, might tempt them. The last of them died in 1813. He had no fixed residence; but was known, and welcomed, whithersoever he chose to roam, as the *wanna laulumees*, or the old singer.

Those who apply classical names to modern phenomena describe the Ugrian metres in general as trochaic; sometimes being dactylic, but never iambic. This means that the accent is on the first, third, and fifth syllables, rather than the second, fourth, and sixth; a fact which arises out of the structure of the language.

The common formula is -⏑, -⏑, -⏑, -⏑; sometimes with -⏑⏑ instead of -⏑, more rarely with --, or the so-called spondee; *e. g.*

Töulis rebbust Körge-sare,
Muña walgest Tüttar-sare,
Muña tumest teised sared.

or,

Kotkad lensid Some-male,
Some-maalta Soksa-male.

Within a certain interval, a certain number of words must begin either with a vowel, or, if with a consonant, with the same; as

Minna *s*ulg ei annud *s*uda
Egga *p*ärg ei *p*öörnud *p*eada.

This is the alliteration of the old German metres; almost to its minutest details. It is held, however, to be no more German in origin than the German is Ugrian.

Archaic words are, in Estonia, as elsewhere, poetical; a fact which creates trouble and perplexity to modern commentators; indeed, many expressions which have wholly dropped out of the current language are to be found in the songs.

The *Liefs* gave its name to Liefland or Livonia.

In Livonia, about twelve individuals still speak the Lief language.* They are to be found near the mouth of the river Salis.

In Cúrland about 2000 use an allied form of speech —falling into an Eastern and a Western dialect.

* Elsewhere, the number of these Liefs is put at twenty-two. The *present* number, however, is only twelve.

CHAPTER XXII.

The Lap of Norwegian, Swedish, and Russian Lapland.

THE last division of the Ugrian stock is, at one and the same time, the most northern and the most western. It is also the one whereof the physical form of the men who constitute it is the most abnormal. Notwithstanding a considerable amount of exaggeration as to the shortness of their stature and the slightness of their frames, the *Laplanders* are an undersized population; and those who enlarge upon the differences between language and blood make much of the physical contrast between the Lap and his well-fed and warm-housed congeners. They also make much of his nomad habits, as opposed to the agriculture of the cow-keeping Fins. Yet the Ugrian character of the Lap language has long been recognized. It was recognized before the word Ugrian came into vogue; indeed, one of the first inklings as to the true nature of the Magyar arose out of comparisons made with the Lap.

In the way of dialect the Lap language falls into two primary divisions; the basis of which is, perhaps, political and religious rather than truly ethnological. There are the Laps of Russia and the Laps of Scandinavia.

The imperfect Christianity of the Laps of Russia is that of the Greek Church; the alphabet applied to their languages being Russian. They amount in the Government of Archangel to 2289.

The Laps of the Duchy of Finland are Scandinavian rather than Russian; or, if not actually Scandinavian, transitional.

The Scandinavian Laps fall into two divisions—one containing those of Sweden, the other those of Norway.

It is from want of information that I have but little to say about the former.

The Norwegian Laps are called, by the Norwegians, Fins; the Fin of Finland being called a Quain—so that Finmarken, the great Lap district, is the March of the Fins. They called themselves Sabme; but are not displeased to be called Fins by their neighbours. Between the Norwegian Lap and the Fin Proper, there is much intermarriage; a little between the Lap and Norwegian.

Their imperfect Christianity is that of the Latin Church, in its Protestant and Lutheran form. Their alphabet, in its present form, is an improvement on the Norwegian. It is an improvement, because the first of three elaborate Lap Grammars was the work of one of the first of comparative philologists—Rask. He met the fact of the Lap system of elementary articulate sounds being in many respects peculiar, by the bold application of new and well-adapted letters. These have been recognized both by Stockfleth and Friis; by the former in his Norwegian and Lap Dictionary, by the latter in his Grammar and Reading-book.

According to Friis, the Lap of Norway falls into two main dialects, a northern and a southern. The northern, or that of Finmark, falls into the subdialects of th parishes of

1. Utsjok, Tanen, Varanger, Vestertanen, and Langfjord.

2. Karasjok, Laxfjord, Porsangerfjord.

3. Kontokæno, Hammerfest, Lopper, Allen, Skjœrvö, Karlsö, Lyngen..

The southern into those of

1. Valsfjorden and Tyfjorden, with the intermediate parishes.

2. Vessen and Röraas, with the intermediate parishes.

South of Röraas the Lap area ceases to be continuous. A few outlying families, however, are to be found in Hedemarken.

That the extension of the Laps to the south was, at one time, greater than at present is a matter of history. That the whole of the Scandinavian Peninsula was originally Lap is a fair inference. The statement that fragments of a Lap population were to be found on the very shore of the Baltic at the beginning of the historical period is, perhaps, exceptionable. Many, however, of the provincial terms from the parts about Bergen are of decided Lap origin. That some of the Fins Proper may be Lap in speech is probable. With this exception the Lap language coincides pretty closely with the Lap blood.

As a general rule the Russian Lap has fewer details in the way of inflection and vowel-changes than the Norwegian and the Swedish. It has in many cases replaced the final vowel by the Russian liquid. It has, in one district, Norse, in another Karelian, in another, Russian glosses. To judge of it in its purity these must be eliminated. Of the Norse dialects it is the Lap of the Hill Laps to which it comes nearest. It is divided into three main dialects.

1. That of Petsingi, Muotki, Patsjoki, Synjel, Nuotosero, Jokostrov, and Balra.

2. That of Semiostrov, Lävosero, Voronesk, Kildin, Maanselkä.

3. That of the Terski Peninsula, on the West of the White Sea.

English.	Lap.	English.	Lap.
Man (vir)	olma	*Fire*	tollo
—— (*homo*)	almaz	*Water*	tätse
Head	oike	*Stone*	kedke
Eye	tjälme	*One*	akt
Ear	pelje	*Two*	kwekt
Nose	njuone	*Three*	kolm
Mouth	nälme	*Four*	nelje
Tongue	njuoktem	*Five*	wit
Hand	ket	*Six*	kot
Foot	juolke	*Seven*	kjeta
Sun	peiwe	*Eight*	kaktsat
Moon	mano	*Nine*	aktfe
Star	täste	*Ten*	tokke

The Lap is usually connected more closely with the Fin Proper than the present writer connects it. Klaproth, for instance, throws both into a class headed *Germanized Fins;* a class which contains the Magyar, the most southern of the Ugrian forms of speech, just as the Lap is the most northern. The languages which this very unnatural class brings together, are simply certain languages which have been in contact with the Germans of either Germany Proper or Scandinavia. The present place of the Lap, which gives it a sub-order to itself, is, more or less, subject to correction. It rests upon the extent to which the Lap is a language of which the frontier has receded, rather than upon any minute philological investigation of the structure of the language itself. As far, however, as the writer has examined this, it confirms his view. Upon the whole, however, the displacement of probably transitional forms in the retrocession of the Lap frontier is his chief argument.

CHAPTER XXIII.

The Peninsular Languages.—Korean.—Japanese and Lúchú.—Aino or Kurilian.—Koriak and Kamskadal.

For the group that now comes under notice I have suggested the name Peninsular; inasmuch as the area to which it belongs stands in strong contrast to those of the preceding ones; all of which lay inland, and consisted of large blocks of land. The area, however, under notice, is essentially maritime; so much so that it has but one large mass of inland district, whereas, on the other hand, it has two (if not three) well-known peninsulas, and one important archipelago. From this we may anticipate its chief details. It belongs to the north-east of Asia, and contains, along with other tracts of minor importance, Korea, Japan, the Kurile Isles, and Kamtshatka.

It is, in respect to its import, a wider class than any one of the last four,—wider than even the Ugrian; by which I mean that the difference of its extremes is greater than the difference between any two Ugrian forms of speech. It falls, too, into divisions of greater magnitude—indeed, it is possible that there may be points of view from which those who contemplate it may think it should be broken up. Upon the whole, however, I consider that it is natural.

Upon one condition required to make it so there is neither doubt nor shadow of doubt—viz.: the extent to which it is separated by broad and trenchant lines of demarcation from the other languages of Asia. With the Ocean on one side, and with languages which have

effected such vast displacements as the Chinese and the Tungús on the other, anything like ambiguity in respect to its boundaries is out of the question.

Its nearest approximations, then, are distant—distant, but important. Nothing is, at one and the same time, other than monosyllabic and even approximately akin to the Chinese. The Korean, however, the most southern continental language of the present group is less distant from the Chinese than anything else—anything else other than monosyllabic. Indeed, if this affinity were all we looked to, the present group would have been taken earlier, *i. e.* in the place of the Tungús. Sequences, however, of this kind are impracticable.

On the north the affinities are decidedly with the languages of America—a fact upon which more will be said when the philology of the New World comes under notice.

The several members of the group not only stand clearly and definitely apart from one another, but the distances between them are considerable—at least in the present state of our knowledge. In the present state, too, of our knowledge they seem equal—this meaning that the Japanese is (there or thereabouts) as like (or unlike) the Korean on the one side as the Aino on the other. This doctrine, however, will probably be modified as our information increases.

Of the *Korean* I know of no grammar, and only a few vocabularies—the chief of which is Medhurst's. Klaproth's, upon which the greater part of the current opinions is founded, is taken partly from Broughton's Voyage, partly from Witsen, and partly from Chinese and Japanese sources.

To this, as well as to the remainder of our materials, much can, doubtless, be added; since the Korean is a lettered language, the immediate origin of the alphabet being obscure.

Water	mu		

The *Japanese* is purely and exclusively insular; *i. e.* has no congener on the continent with which it can be immediately connected, or from which it can be definitely derived. The Keltic of the British Isles is nearly in this predicament—nearly, but not quite. It has the Armorican of Brittany as a congener; not to mention the ancient language of Gaul, which has an historical, though not a present, existence; whilst the Gaelic of Ireland and Scotland, though itself strange to continental Europe, is, still, indirectly connected with it through the British. There is nothing, however, on the mainland of Asia which is so near to the Japanese as the Armorican is to the Gaelic. In no other island is the isolation (or insulation, as we may call it) so complete. The language of the Lúchú islanders is Japanese.

English.	Japanese.	Lúchú.

Nine	kokonots	kannizi
Ten	tovo	tu.

The small islands between the Lúchú group and Formosa are in the same category with the Lúchús themselves, *i. e.* they are Japanese rather than Malay. The names of them end in -*sima* (Madzhiko*sima*, &c.) ; *sima* meaning *island.*

In Yesso the Japanese is intrusive ; the original language being the *Aino*, or *Kurilian.* The Kurilians, or Aino, occupy two localities on the main land and all the islands between Kamtshatka and Japan. The localities on the main land have been already mentioned. One was at the mouth of the Sagalin, one at the southern extremity of Kamtshatka.

That the Kurilian area, like the Korean, once extended beyond its present frontier, is likely. The numerals of the Mantshú of the frontier seem to have taken the Aino ending in *f.*

I know of nothing that illustrates the grammatical structure of either the Kamtshatkan or the Koriak.

The Kamtshatkan call themselves *Itulman;* the Koriaks call them *Kontshala* and *Nümelaha;* the Kurilians call them *Arutarunkar.*

CHAPTER XXIV.

General Observations on the preceding Languages.—Value of the Class.—Original Turk, Mantshú, Mongol, Yeneseian, and Ugrian Areas.

In taking a review of the group which has just been dealt with, we cannot but be satisfied with the precision and definitude of all its boundaries: those of the class itself, taken as a whole, being pre-eminently broad and clear. Where the Mantshú and the Chinese, the Mongol and Bhot, the Turk and Bhot, the Turk and Persian, confront each other, there has been encroachment accompanied by the obliteration of transitional forms, on both sides—the Mantshú, for instance, pressing southward, on the one hand, and the Chinese pressing northwards on the other. And so on with the rest. Where the Turk and Persian cease to confront each other, the Caspian intervenes with its waters. After this comes the mountain-range of Caucasus, to the very feet of which the Turk and Russian have extended themselves—doubtless at the expense of some language akin to the Circassian, or, at any rate, more akin to it than they are themselves. In Europe, all beyond the Dnieper, at least, though now Russian, was originally other than Russian; so that whatever may have been the affinities of the original languages of the Governments of Kursk, Penza and the districts nearest the Mordvin area to the Mordvin and its congeners, all such transitions as they may have effected are annihilated. Again—in Norway and Sweden the present Norwegian and Swedish are intrusive; so that whatever came in contact

with the southern area of the Laps is annihilated also. The remaining boundaries are formed by the Ocean.

Still the distances between the languages of the present group and those of the rest of the world, though great, are, by no means, equal. There are points whereat there is an approximation. These are the neighbourhood of Behring's Straits; Korea; and Lithuania —in other words, the Koriak is notably American, the Korean notably Chinese, and the Lithuanic notably Ugrian. This merely means that there are certain points about which the encroachment and displacement have been less than they have been about others.

This applies, in a less degree, to the minor divisions which lie between the secondary groups. The Tungús, the Mongol, and the Turk, with their intrusions, have effectually obliterated any such congeners as may have led from one of them to the other. From the small amount of difference between their extreme dialects we infer that their diffusion has been recent.

The Ugrian, on the other hand, was a large class, falling into divisions and sub-divisions, and covering a surface which grows wider and wider the more we go back. It is now discontinuous; the result of its discontinuity being definitude of boundary. In Hungary alone it has been intrusive—we might say *pro*trusive; for the Magyar of Hungary is separated from its nearest congener by many degrees of latitude, having found its way into Hungary not by any gradual extension of the Ugrian frontier, but by being bodily projected (so to say) into a strange and foreign country. Of pure protrusion and projection—protrusion and projection accompanied with a separation from its congeners—it is one of the most remarkable examples in ethnographical philology; and one which should never be either forgotten or overlooked when we have languages in extraordinary localities to account for.

Something in the way of an approximation to the

original area of the Tungús, Mongol, and Turk languages is possible. It is the easiest with the Turk. There are many localities where we know that the Turk is *not* indigenous. It never came from Hungary ; nor yet from Constantinople; nor yet from the Lower Lena ; notwithstanding the existence of the Cumanian, the Osmanli, and the Yakut forms of speech in those districts. It scarcely originated on the northern side of the Caucasus in immediate contact with the Tsherkess ; nor yet in the Sayanian range, where it is spreading itself at the present time. It could scarcely have originated in the immediate contact of either the Tungús or the Mongol, from which it differs as a language which meets another from some distant quarter and in an opposite direction. If the doctrine that it is more Ugrian than either Mongol or Tungús be true, it must be a language of western rather than Eastern Asia.

The area for which the evidence of the Turk being intrusive is at its *minimum*, and (changing the expression) the area for which the evidence of its being indigenous is at its *maximum*, is Independent Tartary. On the other hand, it is little better than a desert.

Next to this comes Chinese Tartary. This, however, is unfavourable to its Ugrian and (I may add) its Yeniseian) affinities.

Next comes the Tshuvash and Tsherimis frontier.

To go in detail through the remainder of the groups would be to give a theory of the ethnology of Siberia. The conditions, however, which are required are the same throughout. Where can we prove intrusion? Where is the residuary locality where it can*not* be proved? When this is obtained, how will it account for the affinities? Such is the method. As far as I have been able to work it, I have been led to place the Mongol nucleus in the parts about the Ili and the lakes of its vicinity ; the Tungús on the Upper Amur, the Korean somewhat to the west of its present area ; and

the Aino to some portion of the districts now occupied by the Lamut. The Koriak, the Jukahiri, the Yeniseian, the Samoyed, the Vogul, and the Ostiak, I refer, one and all, to some point considerably to the south of their present northernmost localities. In this, however, there is a mixture of ethnological and philological considerations.

The best name for this class, and perhaps the commonest, is *Turanian:* a term which sometimes gives a larger and sometimes a smaller class than the one which we are now leaving, for India, Persia, and Caucasus.

CHAPTER XXV.

The Darahi (Denwar) and Kuswar.—The Paksya and Tharu.—The Kooch.

THE present section of the class now coming into notice is artificial. It is ambiguous. It is more than this. It is only equivocally ambiguous. The languages which it contains take their present place because they are, to some extent, both Bhot and Indian. Yet they may be so much more Bhot than Indian, or so much more Indian than Bhot, as to require no intermediate classification. Again, one of them may be Bhot, one Indian, and one truly ambiguous. They are so Tamul. What they really represent is the author's want of knowledge and leisure.

The class, then, is provisional. Thus much, however, may be said of its members.

1. That they are Indian in respect to their numerals, throughout ; and Indian in a great many other words.

2. That, so far as they are other than Indian, they are Monosyllabic and Tamul.

The degree to which they are this varies with the language ; and it is possible that, in some of them, the original element may be so thoroughly displaced, as to leave the other bases Monosyllabic and Tamul only in the way that a knife with a new blade and a new handle is still the same knife. But, again, the group is artificial, and the Hindú character of the numerals is, to a great extent, an arbitrary test.

The Darahi and Kuswar are spoken by two broken tribes (I use Mr. Hodgson's expression) in Nepaul.

English.	Darahi.	Kuswar.
Man	manas	gokchai chawai
Head	mud	kapa
Hair	bar	bar
Eye	ankhi	ankhi
Ear	kan	kan
Mouth	muhun	muhu
Tooth	dant	dant
Hand	hat	hath
Foot	god	gor
Blood	ragat	rakti
Bone	had	hadh
Sky	sarag	sarang
Day	din	dini
Night	rato	rathi
Sun	gama	suraj
Moon	janha	jun
Star	tirya	tarai
Fire	age	aghi
Water	hate	hani
Earth	mati	mati

Five	pach	pachie
Six	chha	chha

* Agree with Kuswar.

English.	Pakhya.	Tharu.
Seven	sat	sat
Eight	ath	ath
Nine	nau	nau
Ten	das	das.

The Kooch belong to India (and Sikkim ?) rather than to Nepal ; being occupants of the northern parts of Rungpur, Purnea, Dinajpur, and Mymangsing. The Bodo of their frontier call them Kooch ; the more distant Bodo of Asam call them Hasa. The Dhimal call them Kamul, which, word for word, seems to be Dhimal. For the Brahminic Kooch the following is a vocabulary. For the Kooch, however, who are still the pagan occupants of the more impracticable forests, we have no specimens.

English.	Kooch.	English.	Kooch.
Man (vir)	beta choa	*Star*	tara
Woman	beti choa	*Fire*	agni
Son	beta	*Water*	jal
Daughter	beti	*River*	nodi

Hand	hath	*Seven*	sat
Foot	bhori	*Eight*	ath
Blood	lohu	*Nine*	nou
Sun	bela	*Ten*	das.
Moon	chand		

The Kooch, whose separation from the Bodo and Dhimal, is philological, rather than ethnological, and which, even philologically, is, to some extent, artificial, are bounded on the south by the Bengali area. The Bengali language, however, is not the nearest congener of the class to which the Kooch, though an outlying and equivocal member, belongs.

CHAPTER XXVI.

The Kol group.—Its Affinities with the Môn.

THE dialect, other than Bengali, which, in the way of geography, is nearest to the most southern language of the Tibetan, Burmese, or Nepalese group, is that of the natives of the Rajmahal hills; but this, for a reason which will appear in the sequel, is pretermitted for the present; instead of which we notice the *Kol* dialects of Ramgurh, Monghir, Chuta Nagpur, Gangpur, Sirgujah, and Sumbhulpur: which fall into divisions and sub-divisions. The Sontals, indigenous to the parts about Palamow, have recently intruded themselves amongst the Rajmahalis, and, having so done, constitute the most northern section of the group. Still they are intrusive, and must be kept separate.

Ho, meaning *man*, is the true and native name for the Kol of Kolehan.

The Singbhum Kol is the same as the Sontal except that some of its forms are somewhat shorter, as *ho* = *horl*, *bo* = *buho*, *moya* and *turia* = *mone-gotang*, *turin-gotang*, &c. The same is the case with the Bhumij and Mundala dialects. In these, however, the numerals for 7, 8, 9, and 10 are Hindú—*sath*, *ath*, *nou* (*noko*), and *das* (*dasgo*).

English.	Sontal.	English.	Sontal.
Man	horh	*Foot*	suptijanga
Head	buho	*Blood*	myun

Eye	met	*Sun*	singmanal
Ear	lutu	*Moon*	chaṇdu
Hand	thi	*Star*	ipil

English.	Sontal.	English.	Sontal.
Fire	sengel	*Five*	mone-gotang
Water	dah	*Six*	turin-gotang
One	midh	*Seven*	lair-gotang
Two	barria	*Eight*	iral-gotang
Three	apia	*Nine*	are-gotang
Four	ponia	*Ten*	gel-gotang.

An observation, and an important one, of Mr. Mason's, respecting the affinities of the Môn of Pegu and the Kol, requires notice. The first numerals and several other words in the Môn are also Kol. I cannot, however, with Mr. Mason, infer from this any affinity between the Kol and Môn which is, at one and the same time, fundamental and direct. What I see is this—the chances of a considerable influence from the east coast of India upon Pegu and, perhaps, Cambojia at an early period. The Môn are called by the Burmese *Talieng;* which is, word for word, *Telinga.* The number of the monosyllabic languages, which, in an early stage, had no numerals of their own beyond five, is considerable. The Môn numerals, then, and the other words may have come from India—imported and incorporated. More than this is not necessary to explain the facts; which, on other grounds, will scarcely cover the inference of Mr. Mason.

The eastern coast, however, of India when the words in question were introduced (and, with them, the name *Talien*), must have been Kol rather than Telinga.

CHAPTER XXVII.

The Khond Class.—Khond.—Gadaba and Yerikala.—Savara.

THE Khonds come next; belonging to Orissa rather than Bengal. The Khond calls his own country Kui Dina or Ku Pruti, and that occupied by the Uriyas Sasi Dina. The word *malo* is Uriya, and means a Highland. Within the Sircar of Ganjam (in which the Uriya and Telinga languages meet) lie the Zemindaries of Gúmsúr, Koradah, Souradah, and Kimidi. Each has its *malo*—and the Kimidi Malo is pre-eminently Sour. It falls into—

1. The Sano Kimidi Malo.
2. The Bodo Kimidi Malo. Observe the word *Bodo*.
3. The Parlah, or Porolah, Kimidi Malo.

In the Bodo Kimidi Malo the Khond and Sour are both spoken. The Parlah Kimidi Malo being chiefly (or exclusively) Sour.

On the south-east and east of the Kimidi Malo lies the Souradah—which seems to mean the Sour Country; though Khond in population.

The smaller divisions of the *dina* are called in Khond *khand* = *piece*, or *part*. The *dina* is specified by the name of the chieftain; thus Rogo Dina or Gune Dina is the fief (so to say) of Rogo or Guni. The people are Rogo Millaka, or Dina Millako, *i. e.* Children of Rogo. There is no collective name. The following is Khond, *eo nomine;* the numerals being Indian—

English.	Khond.	English.	Khond.
Man	lokka	*Ear*	kirru
Head	tlavu	*Mouth*	sudda
Eye	kannuka	*Tooth*	ahami

English.	Khond.	English.	Khond.
Hand	kaju	*One*	rondi
Foot	vestamu	*Two*	jodeka
Blood	rakko	*Three*	*tini-gota
Bone	pasu	*Four*	*sari
Sun	bela	*Five*	*panchu
Moon	layadi	*Six*	——
Star	sukala	*Seven*	*sata
Fire	nade	*Eight*	*ata
Stone	viddi	*Nine*	*nogatta
Tree	mranu	*Ten*	*doso.

The following, viz. the Gadaba, belongs, I presume, to the *malo* of Gaddapur, one of the districts of Gúmsúr :—

English.	Gadaba.	English.	Gadaba.
Man	lokka	*Stone*	birel
Head	bo	*Tree*	sunabbo
Eye	ollo	*One*	vokati
Ear	nintiri	*Two*	rendu
Mouth	tummo	*Three*	mudu

The Savara numerals are Kol rather than either Khond or Tamul, though the Sours are, by no means, the nearest to the Kol area.

CHAPTER XXVIII.

The Ghonds.

THE barest part of the maps of India (and by *bare* I mean a district which the paucity of names, whether of villages or natural objects, proclaims to be *unexplored*) is a large space named Ghondwana—large and undefined, the occupancy of a population named Ghond. Word for word, this is Khond. Nothing, however, in the way of either affinity or difference between the Khonds and Ghonds is to be inferred from the similarity. Neither is a native name. Each is a name which certain Hindús apply to certain tribes which they consider ruder and more barbarous than themselves. Like other names of the same kind it may denote anything or nothing in the way of relationship. It may apply to tribes closely allied; or it may apply to tribes, *toto cœlo*, different.

The western frontier of the Khonds of the Gúmsúr Malo and the frontier of the most eastern Ghonds touch and run into each other. "At Sarangaddah, the Uriya quarter is situated between a Khond village to the west, and a Ghond settlement to the east. In other places a Khond village aligns with it.

"A few families of the Ghond race have emigrated from Kalahandi and Bastar at various times. Some have settled at Sarangaddah, while others have passed on into the Goomsur Malo, and penetrated as far to the eastward as Udyagiri, near the head of the Kúrminghia Pass, where a colony has established itself. They are also met with, as a few families, at Chachingudah, and Kiritingiah, of Goomsur, lying between the above points. These emi-

grations still continue in times of scarcity, but their numbers are very trifling. It is in the countries bordering this malo to the west that they are known as a people. The Patros of the frontier divisions of Lonkagodah and Bellagodah are of this race, as is also the Chief of Mohangiri, under Kalahandi, not to mention in this place other men of influence. The Gonds settled at Sarangaddah, receive land of the Patro in return for general service. They intermarry with the families of their race in Goomsur: they reside at the godah. With regard to their customs, their mythology differs from that of the Uriyas or Kondhs. They sacrifice animals, drink ardent spirits, eat flesh, but eschew that of the cow: they will not partake of food with any other class. Their feelings on the question of human sacrifice are not, as yet, accurately ascertained; but it is asserted that they do not perform the rite. The titles amongst them are Dalbehra and Magi. They esteem themselves of great purity of race, so that in former days they considered the approach of a Brahman to their dwellings as conveying an impurity to the spot; they are now, however, somewhat less rigid on this ground. The Uriyas of the hills, while they regard the Khonds as a distinct and inferior race, assign to the Ghonds a common origin with themselves. The tradition received at Sarangaddah is as follows:—

"A certain raja, named Sobhajoi Singh, being unmarried, and desirous of issue, called to his bed four parties in succession. Those selected were the daughters of a washerman, a potter, a distiller of spirits, and a Brahman; and the respective issue was a Doholo or Dolo, a Kohouro, a Gond, and the Nolo Benso Patro—the progenitors of the four classes now met with in the Malo."*

The details of the Kol frontier are not so well-known. Neither are those of the districts where the Ghond and

* Paper by Lieut. J. P. Frye.—*Journal of the Royal Asiatic Society*, vol. xvii. part 1.

Mahratta, the Ghond and Bengali, the Ghond and Telugu, the Ghond and the Hindi forms of speech come in contact. These, however, are the languages by which it is bounded.

A short vocabulary by Mr. Manger, of the Ghond, is to be found in the 145th number of the *Journal of the Asiatic Society*, and a longer one in a previous number. The former gives the language of the parts about Ellichpoór, where the Mahratta is the language with which it is most in contact. The latter is from the district of Seonee; on or near the Kol frontier. The following extracts are from Mr. Manger's notice of it:

In English.

1. The Lord thy God I am, besides me thy gods not any shall be.

2. To yourselves graven images, any sort of creature such as in heaven and on earth, and in sea are, such do not make—you their feet do not embrace, and their obeisance do not perform; because to me jealousy is, and father's sins for children on, punishment inflict, grand children and great-grand children upon those men who my enemies are, and I from among those a thousand (who) me as a friend take, and my commands according to walk, I on them my shadows throw.

3. God's name in falsehood do not take, for guilty will be that man who God's name in falsehood shall take.

4. God's day remember and it holy keep; six days daily work do, and all thy labour perform, but seventh day God's day is, that day thou any kind of work do not make, thou and thy son, and thy daughter, and thy servants, and thy cattle, and thy stranger (thy) house dwelling; because God six days in, heaven, and earth, and sea, and each creature in them existing, them made, and seventh day rest took, therefore that day God hallowed established.

5. Thou thy father's and mother's service perform, therefore thy life, the land upon, God to thee has given, prolonged may be.

6. Thou a man not kill.

7. Thou adultery not do.

8. Thou theft not do.

9. Thou thy neighbour against false witness not give.

10. Thou thy neighbour's house covet not, Thou thy neighbour's wife covet not, and his house-servants, and his ox, and his ass, and anything, that thy neighbour's is it upon covetousness not make.

In English.

Sandsumjee's song hear, O Father.
Six wives he took, Sing-Baba not born,
Seventh wife took, by her Sing-Baba was conceived.
Of her pregnancy Father was not informed.
Departed Father, his kinsfolk being assembled together
For this reason to some one it happened to offer a sacrifice to a God.
Hereupon Sing-Baba began to be born.
Small wife was sleeping, the other six were there.
Said they, grain basket's mouth into, her head let us introduce in our hous child is born,
So said, so done, into mouth her head introduced,
And Sing-Baba was born,
Sing-Baba having taken up, into Buffaloes' stable threw,
And a puppy instead placed,
And said, a puppy is born,
A puppy having brought forth, thence crows to frighten they set her,
Sing-Baba, buffaloes said, that him let none hurt,
Nor blow strike, and into his mouth milk having poured him suckled.
The six wives said, let us go and see him, is he living or dead?
Sing-Baba was playing.
Thence indeed having taken him into cows' stable threw.
The cows said Sing-Baba let no one hurt
Or blow strike, into his mouth milk pouring him suckled,
Therefore information they sent to seek, is he living or dead?

Sing-Baba was playing.
Thence having taken well into threw.
On the third day having gone to see, is he living or dead?
Sing-Baba there indeed was playing.
Thence indeed having taken, Tiger's path upon.
They threw him, Tiger's female and male were coming;
Sing-Baba's cries they heard.
Tigress compassion felt, "my child it is."
Having said so, took him away. Their den came to and their pups from apart set,
Meat bringing their pups to feed
Their pups weaning, with milk Sing-Baba suckled,
So continuing to do, Sing-Baba grew up.
One day his mother her whelps
Together brought, and to whelps began to say
Yourselves among together stay, fight not.
The third day Sing-Baba said, my body is naked
To me a dhoty, dohur, and pugrey give.
She going Bazar road seated remained.
A muslin-maker and cloth-maker that way came
Having got up ran, they their bundles having thrown away fled,
She having taken up brought Sing-Baba took and put on
And his mother's feet kissed,
Staying staid then one day indeed began to say
That to me a bow give. She again went
Seated remained a sepoy armed with a bow that way came.
She ran having cried out. Bow thrown away, he fled.
She having it came and to Sing-Baba gave;
Sing-Baba big brother little brother together played.
Birds shot big brother little brother to them gave to eat
So continuing to do, Sandsumjí home returned with his friends
And Sandsumjí began to say has any one become inspired, let him arise;
God into one not entered? Then Sing-Baba inspiration received.
Sing-Baba was coming, big brother little brother together were
Coming came, in the midst was a bráhman
Him Sing-Baba required to get up, he refused;
Big brother became angry, the bráhman eat up
Sing-Baba the image took up.
All began to say, that you, who are you?
He said that you the Buffaloes and cows ask
And to his little brother said, mother go and call.
He ran and called.
These three species before the punchaite assembled came.
Then Sing-Baba said that them question,
From them they asked, this one who is he?
First the buffaloes said this Sandsumjee's son is.
They said, you how understand? These said
In our house two days staid. How did he remain?

These said thy six wives having taken into our house to kill threw
And there not injured, then cows' house into threw
From these asked, How into your house Baba came?
The cows said, At our house two days stayed.
These six wives thence having taken into well threw,
There indeed not injured, thence taking I know not where took.
Sing-Baba they questioned that thence you went where?
He said of my mother ask.
They mother-tigress asked
You where found? She said
On my road these six wives threw away;
I having taken brought, my whelps weaning,
Milk him suckled and here there with prey
My young fed. All-understood, tigress'
Feet embraced, and her a God established.
And these six wives to this tigress gave.
That day Sing-Baba illustrious became
And Tigress indeed as a God established became.
Of Sandsumjee Baba this song is,
Of Bhirry bamboo-jungle Bhirri the song is.

Data for the Gúndi are pre-eminently deficient.

CHAPTER XXIX.

Uraon and Rajmahali.

It has already been stated that, though the Kol dialects, *eo nomine*, were the ones which were noticed next to those of the class represented by the Darahi and Kuswar, the form of speech, other than Hindú, which lay in the closest geographical proximity to the Himalayas was not, *eo nomine*, Kol.

The notice of it was postponed for the following reason—its affinities are believed to lie with Khond to the south, and with the Uraon to the west of the Kol area rather than with the Kol itself.

Such, at least, is the doctrine expressed in a work which, from both its merits and its circulation, is likely to influence the opinion of investigators—Mr. Caldwell's Grammar of the Dravirian Language—*Dravirian* meaning akin to the *Tamul* and its immediate congeners. That the Tamul is a language of the extreme south we have seen: whereas the language under notice, though scarcely one of the extreme north, is a northern one—northern enough to be spoken along a mountain-range, the foot of which is washed by the Ganges. Near to where this river is cut by the 25th degree of N. L. stand the Rajmahal Hills: where two forms of speech are used. One is the ordinary Suntal of certain intrusive Kols. The other is an older, and apparently a native, dialect—which we may call the Rajmahali.

Now, Caldwell has committed himself to the doctrine that the Rajmahali is more Dravirian than the Kol—though further from the centre of the Dravirian area:

indeed, he excludes the Kol from the Dravirian class—or, at any rate, hesitates to admit it.

I treat, then, the Rajmahali as more Khond than Kol—only, however, provisionally and until further materials for forming a judgment are supplied.

In the following table the words marked are from the list in Caldwell's Grammar; the others from a vocabulary by Major Roberts in the fifth volume of the Asiatic Researches:—

English.	Rajmahali.	English.	Rajmahali.
Man	*male	*Nail*	uruk
Head	kûk	*Hand*	*sesu
——	*kupe	*Fingers*	angilli
Hair	tulli	*Foot*	tshupta
Nose	moi	——	*kev
Blood	kiss	*Arm*	tat budahi
——	*kesu	*Sun*	*ber
Eye	kun	*Moon*	*bilpe
Eyebrow	kunmudha	*Star*	badekah
Ear	kydule	——	bindeke
——	*khetway	*Fire*	tshutsha
Tooth	pul	*Water*	um
Belly	kutshah	*Stone*	tshatshar
Bone	*kochal	*Tree*	mûn
——	kutshul	*Fish*	mín
Back	kukah	*Snake*	nír.

The following (from Caldwell) is a comparison of the Rajmahali and Tamul pronouns:—

English.	Rajmahali.	Tamul.
I	en	en, nan
Thou	nin	nîn
He, she, it	ath	âta
We	nam	nâm
——	om'	ôm
Ye	nina	nim
They	awar	avar
This	îh	î
That	âh	â
Here	îrio	inge
There	âno	ange.

The Uraon, compared, by Caldwell, with the Raj-

mahali, is placed by him in the same category. It is a language of western rather than the northern frontier of the Kol area, within which it is spoken. It is held, however, to be intrusive from the parts about Rotasghur near the junction of the Coylle and Soone.

Its position is provisional.

English.	Uraon.	English.	Uraon.
Man	alla	*Foot*	dappe
Head	kuk, M.	*Hand*	khekhah
Hair	chutti	*Sun*	dharmi
Ear	khebda	*Moon*	chando
Eye	khan	*Star*	binka
Blood	khens	*Fire*	chek
Bone	khochal	*Water*	um.

The words marked with an asterisk are from Caldwell.

CHAPTER XXX.

The Tamul Class.—Telugu or Telinga.—Tamul Proper.—Malayalim.—Canarese.—Tulu or Tulava.—Rude Tribes.—Tuda.—Budugur.—Irular.—Kohatar.

THE Telugu, or Telinga, is spoken from Chicacole to Pulicat, and extends westwards as far as the eastern boundary of the Marathi; being the chief language of the northern Circars as well as parts of Hyderabad, Nagpúr, and Gondwana.

English.	Telugu.	English.	Telugu.
Man	al	*Thou*	nivu
Head	tala	*He*	vadu
Hair	ventruka	*She*	ame
Ear	chevi	*It*	adi
Eye	kannu	*We*	memu
Mouth	noru	*Ye*	miru

The Tamul succeeds the Telinga about Pulicat, and is spoken along the coast of Coromandel as far as Cape Comorin. It then turns north; but is succeeded in the parts about Trevandrum by the Malayalim. Inland, it extends to the Ghauts and Nilgherries. It is spoken, also, in the north of Ceylon, and by numerous settlers and emigrants in Pegu, Penang, Singapore, and the Mauritius.

The Malayalim is the language of the western side of the coast of Malabar. On its east lies the Canarese; on its north the Tulava; on its south the Tamul. The Tamul touches it at Trevandrum; the Tulava and Canarese of Canara about Mangalore. It stretches over about six degrees of latitude, but only in a narrow strip between the Ghauts and the sea. It is the vernacular

of Cochin, and the northern and middle parts of Travancore. It is a separate substantive language, possibly more akin to the Tamul than its other congeners—but no Tamul dialect.

In Curgi the language changes, and is, as may be expected, of so transitional a character, that whilst Ellis calls it a dialect of the Tulu, Mögling of Mangalore states that it is more allied to the Tamul and Malayalim. It is called the Kodugu.

The Tulu, itself, is the most northern language of its class which touches the sea; and it is essentially a language of the coast. It has extended further north; having been encroached on by the Konkani dialect of the Marathi, which abounds in Tulu words, apparently derived from the earlier occupants. It is a language of not only a small area but a decreasing one: being pressed upon by the Canarese. It extends from the Nileswara on the south, in N.L. 13° 30′, where it touches the Malayalim to the Bhahavara in N.L. 13° 30′, four miles north of Upi, where it is succeeded by the Konkani. The German missionaries at Mangalore preach to the upper classes in Canarese, but to the lower in Tulu.

The following are, according to Caldwell, the writer from whose Dravirian Grammar the preceding details are exclusively taken, the statistics of the above-mentioned languages; one of which, apparently, includes the Cúrgi.

1.	Tamul is spoken by	. .	10,000,000
2.	Telinga	„ . .	14,000,000
3.	Canarese	„ . .	5,000,000
4.	Malayalim	„ . .	2,500,000
5.	Tulu	„ . .	150,000
			31,650,000

The previous forms of speech constitute a natural group—a natural group, and not a very large one. They all belong to the Dekhan. They are all spoken by populations more or less Hindú. They are all the languages of the civilized Indian. Their area is continuous; in other words, they are all in contact with each other, and their frontiers join. There is nothing between the Telinga and the Tamul, the Tamul and the Canarese, the Tamul and the Malayalim. Their area is continuous.

The following are from the Nilgherry Hills. They are all rude dialects of the Canarese; of the Canarese rather than the Tamul; though not without Tamul elements.

There is an old Literary, or High Canarese (as, indeed, there is an old Literary, or High Tamul, and (?) Malayalim), with a greater admixture of Sanskrit. It gives *p* rather than *h*, in which several of its modern congeners agree with it.

English.	Old Canarese.	New Canarese.	
Day	pagalu	hagalu	pagil—*Tulu*
Flower	puvvu	huvvu	puvvu—*Tuda*
Horn	pandi	handi	pandi—*Kodugu*
Name	pesaru	hesaru	pudar—*Tula*
River	pole	hole	pole—*Kodugu*
Road	pade	hadi	——
Snake	pavu	havu	pab—*Tuda*
Tiger	puli	huli	pivri—*Tuda*
Tooth	pallu	hallu	pall—*Kodugu.*

All the languages of this class may be grouped round the Canarese. This, says Mr. Reeve, is so like the Telugu that, in many cases, the change of an initial or inflection will make a complete correspondence. Still, if *many* initials or *many* inflections are changed, the difference will amount to a good deal. That the Tulu and Kodugu of Cúrg are mutually intelligible is beyond doubt, and it is not unlikely that, for short and simple sentences, the Tulu and Malayalim may be the same. The same is said to be the case with the Tamul and Malayalim. In this (the Malayalim) and the Telinga we have the two extremes; one for the north-east, one for the south-east.

CHAPTER XXXI.

The Brahúi.

THE language which now comes under notice lies not only beyond the proper Tamul area but beyond the geographical boundaries of Hindostan. It is a language of Biluchistan—but not the Biluch itself. That the *Brahui*, *Brahuiki*, or *Brahooi*, differed from the language of both the Biluches and the Afghans was known to both Elphinstone and Pottinger; for both state the fact. Both, however, treat the Brahúi as Biluches with certain differential characteristics; neither asking how far some of these may be important enough to make them other than Biluch. This is because the political term Biluchistan has concealed one of the most important and interesting affinities in ethnology.

A short specimen of the Brahúi language in Leach's Vocabularies commanded the attention of Lassen, who, after enlarging upon its difference from the Persian, Biluch, and Pushtú, drew attention to some notable similarities between the numerals and those of the South Indian dialects. Following up this suggestion, the present author satisfied himself that the Brahúi tongue was, in many respects, Tamul—an opinion which others have either recognized or been led to form from their own researches.

In the country, however, which they now occupy, the Brahúi consider themselves aboriginal; the Biluch, admitting that they are, themselves, of foreign origin. The rugged and impracticable nature of the Brahúi mountains favours this view.

It is from Leach's notice that the following paradigms are taken. They consist, however, solely of certain Brahúi forms and their English equivalents—grammatical terms, such as Case, Number, and the like, being avoided. They stand in the text of Leach—more, however, in deference to "old-established usage" than because the Brahúi and Latin grammars are believed to give parallel forms.

Extract.

To denote abstraction *àn* is introduced, as *viatàn asit=one from two*, and *hulîàn ditar=blood from the horse; ustat duà=wishes from the heart.*

To denote donation, *ne* or *e* is added, as *dàde yete=give to him.*

To make a noun the instrument of a circumstance, *ene* is added, as *zaghmene=with a sword*, from *zaghm=a sword; latene=with a stick*, from *lat=a stick.*

To make a noun the cause of a circumstance, *àn* is added, as *tapàn=from a wound*, the original case being *tap=a wound.*

To denote inclusion, *tî* is added to the noun, as *shartî=in the city*, from *shar=a city; jangatî kaskune=died in battle*, from *jang=battle.*

Position is denoted by adding *at* to the noun, as *dà kasarat duzare=there is a thief on that road*, from *kasar=a road*, speaking of a road as a whole, or by adding *ai* as *kasarai pîrú araghase=there is an old man on the road*, in the limited sense.

To denote approach or direction, *ài* is added to the noun, as *I' Haidràbadai kawà=I will go to Hydrabad.*

Superposition is denoted by the addition of *à;* as *hulî à=on the horse; katà tikhakh=put on the bed.*

Companionship is denoted by the addition of *to*, to the inflected case of the pronouns; as *neto bafar=I will not go with thee*, from *nî=thou.*

A good Man.

CHAPTER XXXII.

Languages akin to the Hindí.—Its Dialects.—The Punjabi.—The Hindostani. The Gujerathi.—The Marathi.—The Bengali, &c.—The Uriya.

Of the following languages all that need be said at present is, that they are akin to the (1) Hindí. They are—

(2) The Gujerati, or Gujerathi, of Gujerat.

(3) The Mahratta, or Marathi, of Aurungabad, &c.

(4) The Bengali of the lower Ganges, the *valley* of Asam, and parts of Sylhet and Chittagong.

(5) The Uriya of Orissa.

I give these divisions as I find them, adding that, though convenient, they are, by no means, unexceptionable. In the first place, the difference between a language and a dialect has never been satisfactorily explained: so that neither term has yet been defined. It will be seen, ere long, that there are several other forms of Indian speech, of each of which, though we may say with truth that it is more Hindí, more Bengali, or more Marathi than aught else, we cannot say that it is a Marathi, a Bengali, or a Hindí dialect. For this reason it is inexpedient to give the numbers of individuals by which each tongue is spoken. And it is also inconvenient to say whether such and such languages are mutually unintelligible. It is only certain, that whatever difference may exist between any two is exaggerated rather than softened down when they are written. This is due in a great degree to the difference between the alphabets. Though they are all of Sanskrit origin they differ from each other in detail.

Of the languages under notice, the Cashmiri the Gujerati and the Uriya, are spoken not only over the smallest areas but by the fewest individuals; the largest areas being those of the Marathi and Hindí; the largest mass of speakers being those of the Bengali language. It is the Bengali which has the greatest tendency to extend itself beyond the frontiers of India; the Bengali of Asam and Chittagong being the form of speech which is more especially encroaching upon the Tibetan and Burmese areas.

The languages that lie in the closest geographical contact with the members of the Tamul group are the Marathi and Uriya. The affinities of the Cashmirian with the Dard tongues are decided.

I guard against the notion that the difference between the six tongues of the foregoing list is greater than it really is. A little more Sanskrit or a little less; a little more Persian or a little less; a Telinga or a Canarese element more or less; an alphabet of more or less detail—in these points and the like of them consist the chief differences of the languages akin to the Hindí.

I guard, too, against the notion that the preceding list is exhaustive. Before Hindostan has been traversed we shall hear of such sectional and intermediate forms as the Jutki, the Sindi, the Punjabi, the Haruti, the Marwari, the Konkani, and others; of all whereof thus much may be said—

1. That they are allied to each other and to the Hindí.

2. That they are not akin to the Sanskrit in the manifest and unequivocal way in which the Sanskrit, Pali, and Persepolitan are akin to each other.

3. That they are not Tamul or Telinga in the way that the Canarese, the Khond, &c., are Canarese, Tamul, and Telinga.

In Tirhut the language is transitional to the Hindí and Bengali.

The Multani of Multan graduates from the Punjabi to the Yutki, or *vice versâ*.

The Hindí of the Mahratta frontier is called *by the Mahrattas*, Rangri Basha; a contemptuous term, such as *barbarous* would be in the mouth of a Greek, meaning a language other than Mahratta. Being a negative term we can attach no very definite import to it.

The Marwari is the Hindí of Marwar—the chief dialect of Rajputana. The Bikanér is another Hindí dialect; *i. e.* it is a dialect of Northern India, which is not Gujerathi, not Marathi, not Bengali, and not Uriya; and which is more Hindí, *eo nomine*, than aught else.

In Rohilcund the blood is, more or less, Afghan; so that Hindí, in its full purity, is not to be found there. This must be sought in Delhi and Oude.

Bundelcund and Bahar are more Hindí than Bengali; though, to some extent, Bengali also. In Bahar, however, we are within the old Kooch area; and in Bundelcund on the Ghond, and Khond frontier.

The Hindustani, which means the language of Hindostan in general rather than that of any particular

population, and which differs from the Hindí, *eo nomine*, much as a *King of the French* differs from a *King of France*, is a language with a Persian, rather than an Indian, name. As such, it is a general, rather than a particular, term; and it was originally applied not by the Hindús themselves, but by a population on the Hindú frontier.

The Hindustani is a mixed tongue, scarcely, however, a Lingua Franca in the way of the Italian of Algiers and Anatolia. It is essentially Hindí, as may be seen from both the vocabulary and the paradigms. At the same time it contains much Persian, and some Arabic which is wanting in the true vernaculars. Above all, it is the language of the Mahometan rather than the Brahminic population of India; so much so, that in the Grammar of Mr. Hadley, in which we find either the first or an early attempt to reduce it to rule, it is called the *Moors*, *i. e.* the *Moorish*. It is written in the Arabic alphabet, and not in any alphabet derived from the Sanskrit.

The following details of its Accidence are from the Professor M. Williams' Grammar, in which the English alphabet, with certain modifications, is both used and recommended. The extreme simplicity of the declension should be noticed, as well as the postpositive character of the affixes by which the several relations which in Latin and Greek are rendered by *true* cases, are expressed. In *mardká*, &c., there is no true case at all, but only an approximation to one: in other words, there is merely a noun with a preposition—the *Pre*position itself being a *Post*-position.

Nouns.

Mard	*man*	mard	*men*
Mardká	*man's*	mard-on-ká	*mens'*
——ke	——	————ke	——
——kí	——	————kí	——
Mardko	*man-to*	mard-on-ko	*men-to*
Mardse	*man-from*	mard-on-se	*men-from*
Mardmen	*man-in*	mard-on-men	*men-on*
Mardne	*man-by*	mard-on-ne	*men-by.*

The oblique cases (or rather their equivalents) of the pronouns are formed in the same way. So are those of the adjectives.

Verbs.

1.

Main húm	*I am*	Ham hain	*we are*
Tú hai	*thou art*	Tum ho	*ye are*
Wuh häi	*he she it is*	We hain	*they are*

2.

Masculine.

Main thá	*I was*	Ham the	*we were*
Tú thá	*thou wast*	Tum the	*ye were*
Wuh thá	*he, or it was*	We the	*they were*

3.

Feminine.

Main thí	*I was*	Ham thín	*we were*
Tú thí	*thou wast*	Tum thín	*ye were*
Wuh thí	*she was*	We thín	*they were*

4.

Main már-ún	*I may strike*	Ham már-en	*we may strike*
tú már-e	*thou mayest strike*	Tum már-o	*ye may strike*
wuh máre	*he may strike*	We már-en	*they may strike*

5.

Masculine.

Main már-ún-gá	*I will strike*	Ham már-en-ge	*we will strike*
Tu már-e-gá	*thou wilt strike*	Tum már-o-ge	*ye will strike*
Wuh mar-e-gá	*he will strike*	We már-en-ge	*they will strike*

Feminine.

Main már-un-gí	Ham már-en-gín
Tu már-e-gi	Tum már-o-gín
Wuh mar-e-gí	We már-en-gín

The participial character of these forms is apparent; the forms in *-a* and *-i* being as truly masculine and feminine as *amatus* and *amata*, *amaturus* and *amatura*, in Latin. Indeed, if a male, instead of *ego amaturus sum*, and a female, instead of *ego amatura sum*, said *ego amaturus*, or *ego amatura*, we should have a participle with the omission of the auxiliar taking the garb of a true tense. The same is the case with *main már-tá* and *main mártí*.

The equivalent to the infinitive ends in *-na;* as *márná = to strike = ferire = τύπτειν.*

English.	Hindustani.	English.	Hindustani.
Man (*homo*)	ādmi	*Hand*	hāth
—— (*vir*)	mard	*Foot*	pānw
Woman	randī	*Sun*	sūraj
Head	sir	*Moon*	chānd
Hair	bāl	*Star*	tārā
Eye	ānkh	*Day*	din
Ear	kān	*Night*	rāt
Nose	nak	*Fire*	āg
Mouth	munh	*Water*	pāni
Tongue	jibh	*Tree*	per
Tooth	dānt	*Stone*	patthar.

The geographical boundaries of the Hindustani are indefinite; inasmuch as it is the language of a creed rather than a locality. It has been placed, however, next to the Hindí Proper because it is the Hindí Proper which has the best claim to be looked upon as its groundwork—the Hindí Proper meaning the Hindí of Delhi and Oude.

The affinities of the dialects that now come under notice are so thoroughly *reticular* (by which I mean that the connection between them resembles that of the meshes of a net rather than the links of a chain) that no arrangement of them can be strictly natural. In passing, then, from the Hindustani to the Gujeráti I consult convenience rather than aught else. On the south the Gujeráti is bounded by the Maráthi; and on the west by the Marwári dialect of the Hindí. It probably comes in contact with certain Bhil forms of speech, though the details upon this point are obscure. In Cutch it graduates into the Sindhi.

Sir E. Perry expressly states that the Gujeráti interpreters of the Supreme Court can understand the natives both of Sind and Cutch. At the same time there are certain dialects of which they can make little or nothing.

English.	Gujeráti.	English.	Gujeráti.
Man (*homo*)	jana	*Head*	māthum
—— (*vir*)	mānus	*Hair*	nimālo
Woman	bāyadī	*Eye*	ānkh

English.	Gujeráti.	English.	Gujeráti.
Ear	kān	*Moon*	chānd
Nose	nāh	*Star*	tāro
Mouth	mohodum	*Day*	din
Tongue	jubh	*Night*	rāt
Tooth	dānt	*Fire*	āg
Hand	hāth	*Water*	pāni
Foot	pag	*Tree*	jhāda
Sun	sūraj	*Stone*	patthar.

In the Collectorate of Surat the passage from Gujeráti to Maráthi begins. In Durhampur and Bundsla, petty States to the south of the town itself, the Maráthi shows itself. In Penth, still further to the south, though north of Damaun, the language is "Maráthi with numerous Gujeráthi words." South of Damaun the Maráthi, *eo nomine*, and, in unequivocal forms, extends along the coast of Goa ; and, inland, as far as the Ghond, Telinga, and Canarese frontiers.

English.	Mahratta.	English.	Mahratta.
Man (*homo*)	maūsh	*Foot*	paie
—— (*vir*)	purush	*Sun*	suria
Woman	baiko	*Moon*	tshundr

Mouth	l'hond	*Tree*	dzad
Tongue	jib	——	bruksh
Tooth	dant	*Stone*	duggud.
Hand	hat		

The limits of the Maráthi to the east are obscure. In Candeish it comes in contact with certain Bhil dialects, with their congeners. Aurungabad, Berar, and Poonah are pre-eminently Maráthi. Nagpur is Maráthi where it is not Ghond. About Berar the Maráthi, the Canarese, the Telinga and Ghond meet. In Bejapur and Satpura, Canarese and Maráthi villages alternate with each other. In the parts about Pandarpur lie the limits of the Canarese to the north.

Roughly speaking, the Konkani, a well-marked dialect of the Maráthi, stretches in a narrow strip, between the Ghauts and the sea, from Goa on the north to Mangalore on the south. The more minute details, as given, on sound authorities, by Sir Erskine, bring the Maráthi a little lower down and carry the Tulu a little further up. At Carwar, about 55 miles south of Goa, Konkani is the vernacular; but all the inhabitants can speak Maráthi. The limit to the *south* is a village about four miles from Udapi near Cúndapúr, where the Tulu begins.

In the Konkani there are differences; though not (perhaps) local ones. It is the mother-tongue of the Shenvi Brahmins in Bombay who pronounce certain words more fully than others. Thus:—

The Shenvi *udak* = water = the common *udik*;
——— *vriksh* = tree = ——— *vrikh*;
——— *trin* = grass = ——— *tan*.

For *á*, the sign of the masculine gender in Hindí and Maráthi, the Konkani gives *o*—as do the Marwári and the Gujeráti.

The Konkani contains numerous Tulu and Canarese words.

The Bengali, or the vernacular of Bengal as opposed to the Hindustani, is spoken by more individuals than any of its congeners—perhaps, by more than all of them put together. It is the Bengali, too, which more than any other dialect of India has encroached upon the area of the monosyllabic languages of the Bodo, Garo, and Kasia districts; upon Asam, Sylhet, and Tipperah.

1.

English.	Bengali.	English.	Bengali.
Man	manushya	———	chul

Foot	gōro	*Six*	chho
Blood	rokto	*Seven*	shāto
Day	dino	*Eight*	āltho
Night	rāti	*Nine*	nov
Sun	surjiyo	*Ten*	dosho.

With the Uriya we take leave of the languages of the eastern side of the Peninsula and the languages of the Khond and Kol frontiers, and pass to the other side of India.

The *Sindhi* (of Sind) falls into dialects and sub-dialects; the Kutch being treated as one of them. How this stands to the Gujeráthi has already been stated. The Siraiki is the dialect of Upper, the Lar of Lower, Sind: to which may be added a fourth, spoken in the Desert, as far east as Jessulmer.

English.	Siraiki.	Lar.
Man	maru	——

Sun	aftab	*Seven*	sat
Moon	tzandar	*Eight*	ath
Star	tarak	*Nine*	noh
Fire	nar	*Ten*	dah.
——	agan		

Such is the vernacular Cashmirian, or the Cashmirian of common life: the language of literature and polite society being Persian—Persian rather than either Cashmirian Proper, or Hindí. As far, however, as the Cashmirian Proper is written at all, it is written by means of an alphabet of Sanskrit, rather than Arabic, origin. In creed the Cashmirians are more Mahometan than Hindú.

CHAPTER XXXIII.

The Singalese.—The Rodiya.—The Maldivian.

THE nearest representatives of the aboriginal language of Ceylon must be sought for in the dialects of the analogues of the Khonds, Ghonds, Kols, Tudas, and the like: and these we expect to find in a rude state in the more impracticable parts of the island. We expect, too, to find them in a broken and fragmentary condition.

And such is the case. One population which, on the strength of its pagan, or semi-pagan barbarity, has commanded no little attention on the part of investigators, bears the name *Vaddah*, a name which is, more or less, general, and which is of Hindú origin. Whether, however, it represents the aborigines of the island, is uncertain. I know of no monograph that gives us the minute details of the Vaddah creed. I learn, however, from Dr. Rost, who has kindly favoured me with more than one valuable fact relating to the population under notice, that their language varies but little from the common Singalese. If so, however much they may represent the indigenous blood of Ceylon, they are no representatives of the aboriginal language, except so far as fragments of it may be preserved in their dialect. However, of the Vaddah, *eo nomine*, I have seen no specimens.

Still, there *is* a representative of the primitive tongue in Ceylon; and the *Rodiyas*, a broken and sporadic population, amounting to (perhaps) a thousand in all, give it.

English.	Rodiya.	English.	Rodiya.
Man (vir)	gäwâ	*Hand*	dagulu
Woman	gäwî	*Blood*	talu
Head	keradiya	*Sun*	îlay at teriyaŋgê
Hair	kaluwäli	*Moon*	hapa teriyangê

Ear	irawuwê	*Fire*	dulumû
Nose	galla	*Water*	nîlatu
Mouth	galagewunu	*Tree*	uhälla
Tongue	dagula	*Stone*	boraluwa.

The Singalese Proper is not only more Hindí than the Tamul, Malayalim, and their congeners, but more Hindí than most of the dialects of the preceding group. It is the language of a Buddhist as well as that of a Brahminic population—the sacred language of the Buddhists being Pali rather than Sanskrit.

English.	Singalese.	English.	Singalese.

———	ätiya	*Nine*	nama
Blood	le	*Ten*	daha.

The language of the Maldives and Laccadives is Singalese ; the alphabet Arabic.

English.	Maldive.	English.	Maldive.
Man (*homo*)	mihung	*Mouth*	aga
—— (*vir*)	firihenung	*Eye*	lo
Woman	ang-henung	*Day*	duas
Head	bo—*Kol*	*Night*	re
Hair	istari	*Sun*	iru
Hand	aitila	*Moon*	hadu
Foot	fiyolu	*Star*	tari
Tongue	du	*Fire*	alifang
Tooth	dai	*Water*	feng
Nose	nefai	*Tree*	gas.

The following is a specimen of the language; it is a copy of a letter written by the Maldive Malim of a boat at Columbo to his countrymen at Galle :—

At Galle stopping of the Maldives all to the people, Arab boat the Malim. The chief's salam ; now at this port are boats Arab boat Finladu boat offering boat Fadiyaru's boat Ahammá dídi's boat mándu house boat bitter-tree-corner-house boat ; now all people health in remain ; at your port you have news you must send ; at this port there is news I hereby send ; from Europe a new governor is come ; England's king is dead ; lacs many strings salams ; this port's fish we have sold Himiti fish seven tens seven dollars, Male atolu fish five twelves seven, Fading fulu weighed fish forty seven ; thus having sold it stopping for the price ; lacs many strings salams ; this is written here Thursday on the day. If God permits in fourteen days sailed I shall be ; desire is to me.

Gáligai tibi Diwehing-ge em,me kalungnag, Arabu odi Málimí. Kalégefánu salámen ; mifaharag mirarhugai hurhi odi faharhi Arabu-odi Finladu odi wedung odi Fadiyáru odi Aham,má dídí odi, mándu gé odi hiti gas darhu gé odi ; mifaharag em,me kalung gada weeba tibúwewe ; tiyá rarhugai hurhi kabareng fonuwáti ; mirarhugai hurhi kabaru mi fonuwié ; welátung au boda sáhibeng atuewe ; Wilátu rasge maruwej,jewe ; lanka gina farhug salámen ; mirarhu mas vik,kí Himití mas hang diha haĭ riyálayag, Mále atolu mas fas dolos hatakag, Fáding fulu kirá mas sálís hatakag ; mihidang vik,kaigeng tibi agímiwewe ; lanka gina farhung salámen ; miliyuní mitangwí burásfati duwahung. Máĭ kalágerugsewíyái sauda duwahu alugadu furánemewe ; hitai hurbi mewe.

In ordinary English, thus :—

"The Malim of the Arab boat to all the people of the Maldives stopping at Galle.

The chief's greeting: the boats now at this port are the Arab boat of Finladu, the offering boats * of Fadiyaru and Ahammadidi, and the boats of

---

* These are the vessels which bring the annual presents to the Government of Ceylon.

Manduge and Hiti-gas-darhu-ge ; all the people are in good health ; send what news you have at your port ; I hereby send what news there is at this port. A new governor is come from Europe ; the king of England is dead. Very many greetings. We have sold at this port Himiti fish for seventy-seven dollars, Maleatolu fish for sixty-seven, and Fadingfulu fish weighed (?) for forty-seven ; having sold the fish we are waiting for the price. Very many greetings. This is written on Thursday. If God permits, I shall sail in fourteen days ; such is my wish."

CHAPTER XXXIV.

The Paropamisan Group.—The Dard Branch.—The Shina.—The Deer and Tirhai.—The Arniya or Kashkari.—The Cohistani or Lughmani and Pashai.—The Siaposh.

I NOW come to a class for which I propose the name *Paropamisan;* its chief area being the parts between the southern slope of the Hindukush, and either the main stream of the Indus itself, or that of its feeder, the Caubul river. To these drainages, however, it is by no means limited. Some of its members are on the water systems of the Oxus, some on that of the Yarkend river, some (perhaps) on that of the Amur. They are all mountaineers, most of them being independent, and some being either actual Kafirs (*i. e.* infidels) or imperfect converts to Mahometanism. Our knowledge of them is eminently imperfect.

The language of a Paropamisan is Indian rather than Persian. If so, the class under notice is transitional. I repeat, however, the statement, that it is one concerning which our details are of the scantiest.

If the district over which the languages of this class are spoken be (as I hold that it is) the country from which the Hindí elements of the Hindí Proper and its congeners was introduced, scanty as the details are, they are important. They are important even if this be *not* the case: inasmuch as they belong to Persia rather than Hindostan in the ordinary geographical and political sense of the word: and show how little the philological frontiers and the physical frontiers coincide. This, however, is no more than what we found to be the case with the Brahúi.

Again—Cashmir is quite as much Paropamisan as it is Indian in the strict sense of the term.

The dialect spoken due north of Cashmir, and in contact with the Bhot of Ladak and Little Tibet is the *Shina*, known through a Vocabulary of Captain Cunningham's; closely akin to which are the *Deer* and *Tirhai* Vocabularies of Leech. These latter are spoken in, or about, the Valley of Swaut, and may (perhaps) be called the representatives of the Swauti form of speech.

1.

Nine	noh	nao
Ten	das	das.

I would call the sub-section to which these belong the *Dard* group. Captain Cunningham would include under this the Arniya of Chitral and Gilghit: which is nearly the Kashkari of Leech. I give, however, less generality to the word, and would simply call the group *Kashkari.*

English.	Arniya.	Kashkari.

Seven	that	sat
Eight	akht	ash
Nine	no	no
Ten	de	de.

The populations hitherto mentioned are, one and all, Mahometan : though in different degrees. The nearer they are to Persia the more decided the creed. Some, however, are such imperfect converts that they are

denominated by their purer neighbours *Half Mahometans.*

But the tribes which now come under notice are not even Half Mahometans. They are, in the eyes of the true believers, actual infidels; so that Kafir is what they are called, and Kaferistan is their country.

That the difference of creed exactly coincides with a difference of dialect is unlikely. Hence, the Kafirs Proper may graduate into the Cohistanis on one side and into the Kashkaris on the other. The particular division for which we have a specimen of the dialect calls itself *Siaposh;* its occupancy being the right bank of the Kuner and the watershed which divides it from the eastern feeders of the Oxus. According to Dr. Gardiner* the typical Kafirs, *eo nomine,* as opposed to the Half Mussulmen, are—

The Kafirs of	Esh, calculated at	15,000
„	Ushah „	12,000
		27,000

Now, whether Kafir, or half Kafir, this, at least, is certain of the western tribes; viz. that the fragments of their creed are Hindú.

It is also certain that several legends point to India; though not exclusively. They point to India on one side, and to Persia on another.

That they are Franks is believed in some quarters. There is, however, a Cohistani population which calls itself Puraunchеh. It is just on the cards that this may have given rise to the word *Feringi* = *Frank.* Upon their setting on stools and chairs in preference to lying-down like the mass of orientals I lay but little stress. As little do I lay on the fact of their being notorious wine-bibbers. The grape grows in their

* Journal of the Asiatic Society of Bengal. Vol. xxii.

country, and they know how to convert it into wine. Under these conditions they may easily indulge in drink, without being, of necessity, Europeans in blood.

There is a tradition that they are descended from Alexander the Great.

A small pool, near a place called Door, to the east or north-east of Bamian, where there is an intrusive population of Kalzubi Turks, but where the aborigines are Therba and Shu Paropamisans, gives us the following legend.

It is believed to be bottomless. The water is bitter and bituminous, bubbling up with sulphuretted hydrogen, and surrounded by incrustations of sulphur. Lambent flames are said to occasionally play over its surface. Near it is a dark cave, and in this cave are the remains of idols—more than one. The chief of these represent Moh and his wife, Mábún, deities whom even the Mahometans of the district reverence. No one enters the cave with his shoes on.

Two other caves are dedicated to Sheh, the Destroyer, and Zhei, the God of Fire. At each new moon the Therba (who reckon by months rather than years) make a fire-offering to Zhei.

Two other caves are dedicated to Hersh and Maul. Small beads of gold and stone, found in these parts by natives who dig for them, are called Solomon's grains.

Moh created the earth, and his wife Mábún created the wilderness. From them sprang the first giant race. They slept alternately for 999 moons and reigned 450,000 moons. After this period, three sons rebelled, viz. Sheh, the life-destroyer, Zhei, the fire-god, and Maul, the earth-quaker; and, by their combined efforts, Moh was buried beneath the mountains. Confusion lasted 5000 moons, after which the three victors retired each to his own region for 10,000 moons. Maul was lost in darkness of his own creating, Sheh fled with his family towards the sun, which so much enraged Zhei, that he caused fire to spread over the earth; this was quenched by the spirit of Mábún, but not till the whole giant race was destroyed, and the earth remained a desert for 3000 moons. Then Hersh and Lethram, originally slaves of Moh, and great magicians, emerged from the north, and settled in these mountains. By some Lethram is considered as the incarnate spirit of Mábún and the Queen to whom Hersh was vizier. Hersh had three sons, Uz, Muz, and Alk. These he left in charge of all their families, while with a large army he travelled toward the sun in pursuit of Sheh, who was supposed to be still living. So the three sons of Hersh and their descendants reigned happily for 18,000 moons, till Khoor (Cyrus ?) invaded and conquered the country, but, after many years' struggle, they expelled the invader, and retained the name Koorskush (Cyrus killed), now Khirghiz. The descendants of Hersh continued to reign for 10,000 moons more, till Khoondroo (Alexander ?)

invaded the country ; after which no separate legend of them seems to be recollected.

In the same district stands the fort of Khornúshí, to which you ascend by a series of steep steps on hands and feet. Then comes a narrow ledge of rock, from which a ladder of skin ropes, or a basket and windlass, takes the explorer upwards. At the top, a bason of bubbling brilliant water, hot in the winter and cold during the summer, always full, and never over-flowing, gives rise to the following legend—an echo of remarkable clearness, adding to the mysterious character of the spot.

When Noah was at Mecca, Khor, the chief of the district, went to pay homage to him : thereat Noah was well pleased, and promised to grant him any favour for which he should ask. So Khor asked for water, but the voice in which he spoke was rough and loud, and his manner coarse. At this the patriarch was offended. So that instead of blessing the land of Khor he cursed it, and condemned it to become solid rock, nevertheless he kept his promise in the matter of the water, and sent his grandson Shur to carry it into effect. The grandson cried Nu Shu. Echo answered Nu Shu. The sound Nu Shu reached Mecca. And now Nu Shu is the sound which the water murmurs, and which Echo still conveys to Mecca ; the place retaining the name of the three parties concerned—Khor, the prince who spoke so rudely ; Noah, the patriarch who disliked Khor's manners ; and Shu, the grandson who did the work in opening the basin and calling out the words which Echo delighted in repeating.

As far as this belief in Alexander goes, the Paropamisans are simply in the position of the most western of the Bhots ; inasmuch as the same belief prevails in Bultistan or Little Tibet. Indeed, I believe that, at one time, the Paropamisan area extended further to the east. In the collection of ethnographical casts brought home by the brothers Schlagintweit, it was remarked by the collectors, and assented to by the present writer, that the faces from the extreme east, though the faces of Bhots, were, to a great extent, Persian in form and feature. If so, there are good grounds for holding that the blood and the language do not, very closely, coincide ; and that there is Paropamisan blood in the veins of men and women whose language is Bhot, and whose creed (in some cases) is Buddhist. And this is borne out by Dr. Gardner's tables—approximations as they are—wherein we find the following statistical catalogue, which is, evidently, to a very considerable extent, either inferential or conjectural.

(1.)

Bu, or Buh,	calculated at	12,000
Kahuz, or Huhi	„	12,000
Phah, or Phagi	„	12,000
Aspah	„	12,000
Kúlis	„	12,000

		84,000

(2.)

Chinese Subjects.

Beh, or Bethel	„	12,000
Plahi, or Plaaghii	„	12,000
Bhoti (?)	„	12,000
		36,000

In respect to the wine it should be noticed that one of the poetical, or rhetorical, names of the Paropamisus points towards the fact of the grape growing there. It is called in Persia and Cashmír the Wine-cellar of Afrasiab.

It should also be added that on the western frontier we have the *venue* of several of Rustam's exploits; Rustam being the great hero of Persia.

The Dangri (*i. e.* Dunger) of Vigne, is Paropamisan.

There are numerous architectural and sculptured remains in the Paropamisan country.

English.	Siah Pôsh.*	Sanskrit.*
Star	tarah	tara

Five	pich	pancha
Eight	asht	ashtan
Nine	nu	navan
Ten	dosh	dasan.

The *Puraunchehs* are mentioned by Elphinstone, who only knows them as a class of carriers, called Hindki or Indians. He adds, however, that Baber gave them a separate language. I have been told that this is still spoken by a few families.

CHAPTER XXXV.

The Languages of certain migratory Populations of India.

THERE are numerous forms of speech in India, which, like the Hindustani, belong to certain classes of individuals rather than to certain districts. They partake, more or less, of the nature of Cant or Slang. Of many of them a good account is given by Mr. Balfour.

The following are the *Thug* numerals.

English.	Thug.	Bagwan.
One	udanka	ungud
Two	sheluke	duke
Three	udanu	ruk
Four	poku	phoke
Five	molu	but
Six	shely	dag
Seven	pavitru	puyater
Eight	mungi	mung
Nine	tiosu	kone
Ten	avataru	sula
Eleven	ekpuru	ekla
Twelve	habru	jewla.

The *Taremuki* are wandering tinkers.

English.	Taremuki.	English.	Taremuki.
Man	lokro	*Hand*	hath
Woman	chali	*Foot*	pug
Head	mathoe	*Water*	pani
Eye	dolo	*Stone*	duggru
Nose	nak	*Earth*	mattri
Ear	kan	*Tree*	jhar.

The *Bhatúi* are jugglers, posture-makers, and exhibitors of feats of strength.

English.	Bhatúi.	English.	Bhatúi.
Man	múns	*Foot*	pae
Woman	jo	*Fire*	ugg
Head	múndhi	*Water*	pani
Eye	akhoe	*Stone*	pathar
Nose	luk	*Earth*	bhui
Ear	kunnu	*Tree*	jhar.
Hand	hut		

The *Korawi* are musicians, and basket-makers.

English.	Korawi.	English.	Korawi.
Man	amlun	*Stone*	kellay
Woman	punjeri	*Earth*	tirri
Fire	nerpu	*Tree*	muru.

The *Ramusis* are men of predatory habits in the Mahratta country, but Canarese or Telinga in origin.

English.	Ramusi.	English.	Ramusi.
Eye	kunnul	*Fire*	dhupa
Tooth	punnul	*Water*	nidul
Sun	goanda	*Stone*	ratul.
Moon	phakut		

So are the *Mangs* who also belong to the Mahratta country.

English.	Mang.	English.	Mang.
Eye	kewrja	*Fire*	dhupa
Tooth	chawur	*Water*	nir
Sun	goanda	*Stone*	upalla.
Moon	goanda		

There are seven castes of *Nuts*,* or *Bazighurs*, imperfect Mahometans, who dance and juggle in Bengal.

English.	Hindostanee.	Nut.	Nut.
Fire	ag	ga	kag
Bamboo	bans	suban	nans
Oven	chilum	limchi	nilum
Breath	dum	mudu	num
Remembrance	íad	daí	kíad
Beggar	fuqír	ríqífu	nuqír
House	ghur	rughu	rhur
India	Hindustan	Dusítanuk	Kindustan
Here	idhur	dhuri	bidhur

* Captain Richardson, in Asiatic Transactions, vol. viii.

English.	Hindostanee.	Nut.	Nut.
When	jub	buju	nub
Who	kon	onk	ron
Long	lumba	balum	kumba
Mouth	mas	samu	nas
Sect of people	nut	tunu	kut
Age	omr	muru	komr
Saint	pír	rípu	chír
Fort	qilla	laqeh	rulla
Opposite	ruburu	bururu	kuburu
Gold	sona	naso	nona
A search	tulash	lashtu	nulash
Disagreement	umbunao	nunbeh	kunbunao
Heir	waris	ruswa	quaris.

The *Katodi* are catechu gatherers in the Mahratta country.

English.	Katodi.	English.	Katodi.
Call	akh	*Hawk*	moregai
Boiled rice	anuj	*Take*	li
Hedgehog	ahida	*Give*	wope
Kite	alav	*Turban*	salú
Crab	kirlu	*Dog*	súna
Fowl	kukdai	*Boy*	sora
Iguana	gohur	*Girl*	sori
Arrow	chumboti	*Crow*	hadia
Munjus	nagulia	*Man*	hodus
Crane	bugad	*Woman*	hodis.

To these add the *Bowri* and *Gohuri*.

English.	Bowri.	Gohuri.
Man	mankhoe	gohur
Woman	manussi	gohurni
Head	goddo	mathoe
Eye	dolo	ankhi
Nose	nak	nak
Ear	kan	kan
Hand	hatha	hath
Foot	——	pae
Water	pani	pani
Stone	bhattu	bhatta
Earth	bhoe	jami
Tree	jhar	jharr.

Of the characteristic elements in these forms of speech some are purely artificial like those in the Nut Vocabulary); others of Tamul origin—Tamul meaning, not only the Tamul proper, but its congeners.

CHAPTER XXXVI.

The Gipsy.

WHEREVER we find a *Gipsy* who retains any portion of his original language, no matter where we find him, that primitive element, be it much or little, is Indian. It is also Indian of the Hindí, rather than Indian of the Tamul type. The first of the following short vocabularies of the Gipsy language of different countries, is from Persia, the next from Ægypt, the last from Norway.

The Gipsies of Persia are known under the names of Ghurbat (or Khurbat), Goabaz (probably the same word), Duman, and Kaoli.

(1.)

English.	Khurbat.	Duman.
Head	sir	murras
Hair	val	khalluf
Ear	kan	priuk

Sun	kam	shems	shems
——	karzi	——	——
——	karieh	——	——
Moon	kano	kamr	mahtaweh
——	kariz	——	——
Star	astra	nejm	——
Fire	ag	megumdara	ag
Stone	path	hajjar	——
Tree	kerian	mishgareh	kannin.

(3.)

English.	Gipsy of Norway.	Tater.*
One	gikk	jek
Two	dy	dui
Three	trin	trin
Four	schtar	schtaar
Five	pansch	pantsch
Six	sink	schoov
Seven	schuh	efta
Eight	okto	ochto
Nine	engya	enja
Ten	ty	desh.

To which add *astro* = *star*, *bal* = *hair*; *si* = *heart*; *sap* = *snake*; *Rommano* = *Gipsy*.†

With these specimens for the two extremes we may easily believe that the Gipsy of the interjacent countries is truly Indian in its basis.

* A variety of the ordinary Gipsy, which, in Norway, is called *Fante*.

† Sundt. *Beretning om Fante eller Langstrygerfolket.*

CHAPTER XXXVII.

The Kajunah.

In Cunningham's Ladak is a specimen of the language of Hunz-Nagar, to the north and north-east of the Chitrali: and in contact with it; with the Bhot; with the Turk of Chinese Turkestan; and, probably, with some Mongol form of speech. I cannot, like its collector, connect it, off-hand, with the Shina and Arniya. The following table shows too much difference for this.

English.	Shina.	Arniya.	Kajunah.
Man	musha	rag	hir, er
Woman	grin	kamri	gus
Head	shis	sur	yetis
Eye	achhi	ghach	ilchin
Ear	kuṇd	kad	iltumal
Nose	noto	naskar	gomoposh
Mouth	anzi	diran	gokhat
Tooth	duni	dond	gume
Hand	hath	hast	gurengga
Foot	pa	pang	goting
Blood	lohel	le	multan
Sky	agahi	asman	ayesh
Sun	suri	——	sa
Moon	yun	——	halans
Star	taro	satar	asi
Fire	agar	ingar	——
——	phu	——	phu
Water	wahi	augr	chil
River	sin	sin	sindha
Stone	bat	——	dhan.

Besides which, the numerals are not only different from the Dard dialects, but from those of all other languages known to me.

One	hin	*Seven*	talo
Two	altas	*Eight*	altambo
Three	husko	*Nine*	huncho
Four	walto	*Ten*	tormo
Five	sundo	*Twenty*	altar
Six	mishando		

Ja ba=*I am.*	Hurtu bai=*we are.*
Um ba=*thou art.*	Ma bau=*ye are.*
Ai ba=*he is.*	Menig bau=*they are.*

Meanwhile, the following forms are from the Shina; the first being (apparently) Kajunah; the second Indian; the third Brahui.

1.

Bé=*be thou, being.*
Bilo=*to be.*
Boye=*being.*

2.

Mo hos=*I am.*	Bé hás=*we are*
Tu hao=*thou art.*	Tso hath=*ye are.*
A'h hao= *he is.*	A'h há=*they are.*

3.

Mo asúlús=*I was.*	Be asilis=*we were.*
Tu asulu=*thou wast.*	Tso asilit=*ye were.*
Ah usulu=*he was.*	Zé asili=*they were.*

The Kajunah is just more Paropamisan than aught else. Still, *provisionally* (and only *provisionally*), I separate it.

CHAPTER XXXVIII.

The Pushtu, Patan, or Afghan.

AFGHAN and Afghanistan are Persian names. The native name is *Pukhtu* in one, *Pushtu* in another dialect.

English.	Western Pushtu.	Eastern Pukhtu.

In India the word *Pukhtu* becomes *Patan.*

CHAPTER XXXIX.

The Persian.—The Huzvaresh.—The Parsi.—The Modern Persian.—The Biluch.—The Kurd.—The Buruki.

I BEGIN the notice of the languages of *Persia* and its congeners with the following extract from Prichard.

The first appearance of the ancient Medes and Persians, during the sixth century before our era on the theatre of human affairs, was almost as sudden as that of the Huns, or Turks, or Mongoles, in a later age. Shortly before the period when they gained the mastery of the world, their name seems to have been unknown to Europe and to Western Asia. The Greeks of the Homeric age, and while the kingdom of Lydia was growing up in Asia Minor, appear never to have heard of the Persians; nor have we any proof that their existence was known except by the predictions of the Prophets to the ancient Hebrews. Even in the historical records referring to preceding times, which the Greeks afterwards found in the east, there is no trace of an ancient empire, or even of an independent nation, in the countries between the Tigris and the Indus, dating its existence many generations before Cyrus. The Assyrian kingdom of Ninus and Semiramis and their successors is said to have reached to the borders of India. Whence, then, came that great and powerful race, who suddenly overturned all the dynasties of Asia, subdued the civilized parts of Africa and of Europe? Were they one, perhaps the first, of those great swarms, who, from the remote regions of High Asia, have poured themselves down in different ages to overrun the Eastern world? or had they been, as it is generally supposed, the primeval inhabitants of some region in the vast extent of Iran, who, like the Arabs in later times, after remaining for ages in quiet obscurity, suddenly emerged, as if moved by some inward impulse, and like that people became almost universal conquerors?

Samples of the language of the Sassanian period have come down to us as inscriptions, as legends on coins, and as written compositions. As the dynasty reigned from the third to the seventh century, and as the reigns of both the earliest and the latest of the kings are illustrated by memorials of some kind, the presumption is against uniformity. So is the fact. There are divisions, sub-divisions, and cross-divisions in the criticism of the

Sassanian memorials. The older differ from the newer, both in respect to the language which they exhibit, and in respect to the alphabet in which they are embodied.

The notice of the inscriptions comes first. The chief are from Nakhsi-Rustam, Persepolis, Kirmanshah, and Hajiabad. They have long commanded the attention of Orientalists. The chief of the earlier memoirs upon them was by De Sacy, and it is a memoir to which later investigators have added but little. The inscriptions are neither numerous nor long: neither are they rich in forms and words. Titles, as in inscriptions in general, form a large part of them. Of verbs, there is no instance. The alphabet is Semitic; and, like the other Semitic alphabets, with the exception of the Æthiopian, is read from right to left. The alphabet is Semitic, and *lapidary*, i. e. it is, comparatively speaking, rectilinear and angular rather than curvilinear and round.

The older the coin, the more lapidary the character of the letters of its legend; a fact upon which Mordtmann has suggested the following classification; a classification which gives (1) coins with their legends in the lapidary alphabet; (2) coins with their legends in an alphabet more cursive than lapidary; (3) coins with their legends in an alphabet actually (or nearly) cursive. The first class represents a period from Artaxerxes to Narses, when the tendency to transition begins. All, or almost all, of the bilingual inscriptions belong to this period.

The second, of which the typical representatives are the coins of Varames IV., reaches from Sapor II. to Chosroes II.: the third from Chosroes II. to the end of the dynasty, and a little beyond it; a little beyond it inasmuch as some of the early Caliphs used the Sassanian alphabet in their legends. A series of coins from Taberistan belongs to this period. That the three classes graduate into each other is plain.

The same applies to the language, so far as our scanty data allow us to judge. Mordtmann suggests that the

earliest and the latest legends belong to different languages; or rather to the same language in stages sufficiently different to be treated as such. Spiegel, on the other hand, refers them all to one language.

So much for the inscriptions and coins. It was necessary to begin with them, because they give us dates, which the literary compositions, though much more valuable as representatives of the language, do not.

The particular dialect that the Sassanian memorials represent is that of south-western Persia. The extent to which it is mixed with Semitic elements is in favour of this. So are the localities of the chief inscriptions; especially those of Persepolis and Nakhsi-Rustam. The dynasty I believe to have been other than Persian; so that it would take the language of the capital as it found it. The Semitic alphabet, also, lay near at hand. It was current in Syria, and Mesopotamia; not to mention the fact of its having extended itself to Caubul some generations before. The use, however, of it was, as far as we can judge from negative evidence, an innovation—the legends of the Arsacidan coins having been Greek.

The common name for this form of speech, from the time of D'Anquetil du Perron until the last ten years, was Pehlevi. Spiegel, however, in the preface to his Parsi Grammar, a forerunner of his one upon that of the Sassanian compositions, has named it Huzvaresh; and given fair reasons for doing so. At any rate, the name Pehlevi is inconvenient.

What Spiegel calls the Parsi is treated by him as either the actual Huzvaresh, or a near congener of it, in a newer form, and, as a kind of Huzvaresh of the early Mahomedan period, *i. e.* of the time between the last of the Sassanians and Firdusi who wrote under Mahmud of Ghuzni. The Parsi compositions are, one and all, translations from the Huzvaresh. Their alphabet is Huzvaresh. They are without either dates or names. The translations, however, of two works, the

Minokhired, and the *Shikand-gumâni*, are held to be older than that of a third, the *Patet Irani*. Finally, the language is held to be transitional to the Huzvaresh and the modern Persian.

A well-known statement from the *Ferheng-i-Jihângîrî* tells us, that when that work was written there were seven dialects of the Persian language, of which four were obsolete, and three in use. These seem to have been literary forms of speech; or, at any rate, forms of speech which had been subjected to a certain amount of cultivation. I imagine that there were written compositions in all of them, and that they were mentioned by the writer just as the Sicilian, the Bolognese, or the Milanese might be mentioned by an Italian critic as dialects of the Italian Peninsula. If so, they were provincial or local forms of speech. If so, they were forms of speech which were scarcely dialects in the strictest sense of the word; inasmuch as literary influence had, to some extent, acted upon them—such influences always having an assimilating tendency.

Of these, the four obsolete dialects were the Herevi, the Segzi, the Zavuli, and the Sogdi, *i. e.* the dialects of Herat, Seistan, Zabulistan, and Bokhara—the ancient Sogdiana. The three in use were the Pehlevi, the Parsi, and the Deri. Of these names four are not only geographical, but are visibly so. *Parsi* is ambiguous. It may mean either the dialect of the province Fars, or the dialect of certain books belonging to the Parsis. Pehlevi is, perhaps, the Huzvaresh—though the identification is not without its elements of uncertainty. *Deri* is a difficult term, being, apparently, word for word, the same as Deer, Tirhai, &c. If so, it is a geographical term. If so, however, is it geographical without being definite?—inasmuch as *D-r* means no particular place, but any place with certain physical characters. It means no more than the word *Highland*,

a word which may apply anywhere where the *Lands* are *High*.

Simply from finding that the vocabularies headed Dêr, Tirye, &c., come from Caubul, and the Indian frontier rather than from the western side of Persia, I am inclined to make the Deri an *Eastern* dialect. Whether it is that of Firdusi is another question ; indeed, the whole question concerning the seven dialects of the *Ferheng-i-Jihângîrî*, is rather one of exegesis than one of proper philology. That a language like the Persian, which is spoken over a vast area, should fall into dialects and sub-dialects, is no more than what we expect *à priori*. We expect, too, *à priori*, that some of these should be of sufficient importance to command the attention of native commentators. That any such commentator should give us either the whole details, or an accurate classification, is unlikely. It is only likely that he will give some extreme or well-marked forms.

Upon the actual details of the Persian dialects, as at present spoken, I can give nothing definite. The dialects of Ghilan, Mazenderan, and Aderbijan, are said to exhibit notable characteristics—indeed the statement may be found in good books, that Pehlevi is still spoken in certain parts of the last-named province. Whether this be the case or not, depends upon the meaning attached to the word. All that can safely be inferred from the assertion is the existence of some archaic dialect. Upon the dialects of the towns, and upon those of the country in general, the literary language, in its cultivated form, has had great influence ; in other words, the ordinary language of a great part of Persia approaches it in the way that the ordinary language of the towns of England approaches the English.

English.	Persian.	English.	Persian.
Man (homo)	admi	*Moon*	māh
—— *(vir)*	mard	*Star*	sitārā
Woman	zan	*Fire*	eātāsh
Head	sar	*Water*	ab
Hair	mū	*Stone*	sang

4. In Afghanistan and elsewhere, there are certain populations which the Afghans, or whoever may be the predominant population, separate from themselves, sometimes under the general name of Tadzhik, Deggaun, or Parsiwan, and sometimes under some specific or particular denomination. Most (perhaps all) of these use a form of speech which is essentially Persian. Such is that of the Barakis, of Afghanistan, a population of which there are two divisions, one in the province of Lohgad, who speak Persian *eo nomine*, and one of the town of Barak, "who speak," writes Leach, "the language called Baraki." But this is Persian also—*i. e.* the Persian of Barak, though not of the purest kind. Possibly it contains an artificial element; at any rate, Leach's notice of it should be known.

It makes the Baraki originally inhabitants of Yemen, whence they were brought by Mahmud of Ghuzni, when he invaded India; the Sultan, pleased with their services, was "determined to recompense them by giving them in perpetual grant any part of the country they chose; they fixed upon the district of Kànìguram in the country of the Wazìrìs, where they settled. There are 2000 families of the Ràjàn Barakîs, under Rasul Khán who receives 2000 rupees a year from Dost Muhammed Khán. The contingents of both these chiefs amount to 50 horsemen who are enrolled in the Ghulam Khána division of the Cabùl army. There are also 2000 families of Barakîs at Kànìguram under Sháh Malak, who are independent. The Barakîs of this place and of Barak

alone speak the Barakî language. We receive a warning, from the study of this vocabulary, not to be hasty in inferring the origin of a people merely from the construction of their language; for it is well known that the one now instanced was invented by Mir Yu′zu′f, who led the first Barakîs from Yemen into Afghanisthan: his design was to conceal and separate his few followers from the mass of Afghans (called by them Kásh), who would no doubt at first look upon the Barakîs with jealousy as intruders. The muleteers of Cabúl, being led by their profession to traverse wild countries and unsafe roads, have also invented a vocabulary of passwords."

English.	Baraki.	English.	Baraki.
Head	sar	*Village*	gram
Nose	neni	*House*	ner

Tree	darakt	*Nine*	noh
City	kshar	*Ten*	das.

How far the dialects of Wokhan, Shugnan, and Roshan, are Persian rather than Paropamisan, or Paropamisan rather than Persian, or how far they are transitional to the two, is a point for which we want *data*.

NOTE.

At the risk of appearing unduly speculative and presumptuous, I venture on the following suggestion, viz. that the true name is *Husvadesh* rather than *Huzvaresh*. The preliminary remarks of Spiegel (pp. 22–23) supply the bases of this conjecture. Quatremère gives the following translation of a passage in the *Kitab-ul-fihrist*—"*Les Perses ont aussi un alphabet Zewaresh dont les lettres sont tantôt liées, tantôt isolées*," &c. This gets rid of the

initial syllable. It also renders it probable that the *r* is a clerical error for *d*. If so, it is simply the language, or alphabet, of *Siwâd*.

I also suggest, on the strength of Mohl's conjecture, that the root of the word *Pehlevi=boundary* or *march*, that the term, like the German *Marco-mannic*, may be the language of any district which constituted a frontier, so that there may have been more *Pehlevis* than one. One of these was the district named *Fehleh*, which comprised the five towns of Rei, Ispahan, Hamadan, Mah-nehavend, and Aderbijan. The authority for this is Ibn Hauqal, who travelled in Persia in the fifth century of the Hejira. Other statements (which may be found in Spiegel) confirm this by connecting the Pehlevi with the Ghilan dialect.

Geographically, then, the Pehlevi was a dialect of the north-west, the Deri (which was spoken with great purity in Balkh) being one of the north-east. But it was also used in a chronological sense, and meant (as Spiegel remarks) Old Persian.

The geographical Pehlevi, then, may be one dialect, the chronological or historical Pehlevi, another. It is this latter which is most especially connected with the Huzvaresh.

CHAPTER XL.

The Iron.

IRON is the native name for a population which is called by its neighbours Osset: its occupancy being the parts about the Vladikaukasus, where it is bounded by the Georgian on the south, and certain Lesgian and Tshetsh dialects on the north, east, and west. Of all the languages of Caucasus, it is the one which nearest approaches the Persian, and (through it) its real or supposed congeners of what is called the Indo-European class: for which reason it has commanded more than ordinary attention. It cannot, however, be separated from the other languages of the great mountain-range to which it belongs.

English.	Iron.	English.	Iron.
Man	moi	*Hand*	kukh
Head	ser	*Foot*	kakh
Eye	tsaste	*Blood*	thuh
Nose	findzh	*Sun*	khor
Ear	khuz	*Moon*	mai
Hair	dzikku	*Star*	stal
Mouth	dzug	*Fire*	sing
Tooth	dendag	*Water*	dun
Tongue	awsag	*Stone*	dor.
Beard	botso		

The nearest congeners of the Iron are the Persian on the one side and the Armenian on the other, the relationships on each side being distant; or, at any rate, less near than the geographical relations of the three languages would lead us to expect.

Among the Persian forms of speech the Iron is nearest to the Kurd.

Next to the Georgians, the Iron is the population of Caucasus which is most thoroughly brought under Russia. Hence, the language, so far as it is written at all, is written in Russian characters. Such is the case with the Dictionary of Sjögren ; in which the Russian alphabet, with the addition of several new signs, is the medium.

Of Iron dialects there are, at least, two—the ordinary Iron and the Dugorian. A third, quoted as the *Tagaurian*, may be one of two things. It may be a real fresh dialect or it may be another form for *Dugorian*.

Of the grammatical structure of the Iron, a short sketch (of which an abstract is given in the present writer's Varieties of Man) is published by Rosen.

That the Iron are the descendants of the Alani, who were, themselves, the descendants of certain Medes, by whom a district of Caucasus was colonized in the time of the Achæmenidæ, is a doctrine of Klaproth's, which has met with more approval than it deserves. It rests on a confusion between the name *As* (= *Osset*) as applied to the Iron by themselves, and the name *As* (= *Osset*) as applied to them by some one else.

The similarity of form between *Iron* and *Iran*, the name of a province of Persia, as well as the Sassanian for Persia in general, is more important. The true explanation, however, of this has yet to be given.

Upon the claims of the Iron to be placed in the same class with the Latin, Greek, German, Slavonic, and Lithuanic, more will be said in the sequel.

CHAPTER XLI.

The Armenian.

THE nearest congeners to the Armenian are the Iron on the one side, and the Georgian on the other: the relationships on each side being distant; or, at any rate, less near than the geographical relations of the three languages would lead us to expect.

English.	Armenian.	English.	Armenian.
Man (homo)	mart	*Tooth*	adamn
—— *(vir)*	air	*Hand*	dzyern
Head	klukh	*Foot*	wot
Hair	hyer	*Tongue*	tyesu
——	lav	*Heart*	zird

——	kit	——	grag
Mouth	pyeran	*Water*	tshur
Ear	ungn	*Snow*	ziun
——	agantsh	*Stone*	khar
Beard	morusk	*Hill*	sar
——	——	*Fish*	tsugn.
Blood	ariyun		

There are Armenians beyond the limits of Armenia. There is a colony in Persia near Isfahan, founded by Shah Abbas, the founder of the Georgian colony in Khorasan. There are Armenians in India, and many thousands in Constantinople. In *European* Russia their census is as follows :—

In the Government of	Astrakan . .	5,272
———	Bessarabia . .	2,353
———	Ekaterinoslav .	14,931
———	St. Petersburg .	170
———	Stauropol. . .	9,000
———	Tauris. . . .	3,960
———	Kherson . . .	1,990
	Total . . .	37,676

But the most important settlement is that of the Mechitarist monks on the Island of St. Lazarus, in Venice. Here is the centre of the Armenian literature; with its library, rich in MSS., some published, some unpublished. Nine-tenths of the Armenian compositions that appear in print proceed from this Venetian press. The Armenian literature goes back to the fifth century, and the Armenian alphabet, which, as far as the relation of signs to sounds is concerned, is one of the completest in existence, has, in the form of its letters, deviated from its prototype (whatever that was) to a great degree. It affects straight lines and angles, and exhibits a *minimum* of curves. In the order and names of its letters it is Greek.

The languages that have more especially encroached on the Armenian are the Turk and the Persian.

CHAPTER XLII.

The Dioscurian Group.—Meaning of the Term.—Georgian Division.

So much is said and written about the *Caucasian* division of the human species, where the word is used in a general sense, that, when we come to the mountain-range of Caucasus itself, and find ourselves in the midst of details which are truly and strictly Caucasian, we are constrained to either repudiate the current meaning of the word, or to use it with a circumlocution, and talk of *Caucasus in the limited*, or *Caucasus in the geographical*, sense of the word.

We may do this, or we may coin a new term. The term, here and elsewhere, proposed by the present writer, is *Dioscurian;* Dioscurias being the name of one of those towns of the Caucasian sea-coast which is not only mentioned by ancient writers, but mentioned with reference to one of the most remarkable characteristics of modern, as it also was of ancient, Caucasus. This is the multiplicity of languages and dialects. The business, says Pliny, of Dioscurias had to be transacted through the medium of thirty interpreters. Now, the number that would be requisite for a similar function in modern Caucasus, is undoubtedly less, the Turkish being pretty generally understood, and serving as a kind of *lingua franca*. Nevertheless, the actual number of separate substantive languages, dialects, and sub-dialects, is, still, considerable, as will be seen when we come to the details. Meanwhile the leading groups are represented

by the following languages: (1.) the Georgian; (2.) the Lesgian; (3.) the Tshetsh; (4.) the Circassian.

The most northern, and at the same time the rudest, of the Georgian populations, are the descendants of the Suani, lying inland, at the head-waters of the Zkhenist-zkhali, Eguri, and Egrisi, between Sukhumkaleh and the Phasis. They call

Themselves . .	*Suan.*
The Abkhas . .	*Mibkhaz.*
— Kartuelians .	*Mkarts.*
— Mingrelians .	*Mimrel.*
— Karatshai . .	*Ows.*
— Iron . . .	*Sawiar.*

The *Mingrelians* face the Euxine, belonging to the drainage of the Phasis; the upper portion of which is

Imerithi, the land of Imer, or Iber; word for word, the ancient Iberia. To the east of Imerethi lies the watershed of the Phasis and Kur, the occupancy of the

Kartuli, *Kartueli*, or *Kartulinians*, the Kartueli form of speech being the Georgian of Tiflis; the Georgian of the literature and alphabet.

Guriel is connected, in the way of dialect, with Mingrelia, being, probably, transitional to the speech of that principality and

Lazistan, or the country of the Lazi. This extends along the sea-coast, from the parts about Batúm, at the mouth of the Tsorok, to Rizeh, east of Trebizond—perhaps further. Inland it extends over the country between Kars and the Black Sea. Its exact boundaries, however, are not known.

The Lazi are subject to Turkey, and are Mahometan in creed. The other Georgians are Christians, according to the church of Armenia, and subject to Russia. Like some of the Tsherkess, the Lazi were originally Christian; their conversion having been effected about the seventh

century. Even now, they abstain, to a great extent, from polygamy.

The Georgian alphabet, which, as far as the relation of signs to sounds is concerned, is one of the completest in existence, affects, in the form of its letters, curves, and eschews straight lines and angles. This places it in strong contrast with the Armenian. Yet it is from the Armenian that it was, most probably, derived. Indeed, the ecclesiastical alphabet (for the preceding remarks apply to the vulgar alphabet only) is evidently of Armenian extraction

CHAPTER XLIII.

The Dioscurian Group.—Lesgian Division.

THE Caucasians of the Koisu and Terek, rivers which fall into the Caspian, constitute the Lesgian group ; occupants of Eastern, rather than of Central or Western Caucasus ; occupants of parts of Daghestan and Tabasseran, and conterminous with Shirvan, a province of Persia. The Georgians call the Lesgians *Lekhi*, which is the Greek Λήγαι.

Daghestan, or Leghistan, the country of the Lesgi, is the ancient Albania ; the country conquered by Pompey.

Lesgian, like Circassian, is no native name ; for the Lesgians, like the Circassians, have no term which is at once native and collective. Its details are to be found in the hilly country out of which the rivers of Daghestan arise, the actual coast of the Caspian being Turk and Persian rather than Lesgian.

In the watershed between the Aksu and Koisu (Turkish terms) lie the Avar and Marulat tribes. Word for word, Marulat, the plural of Marul, from Mehr a hill, is the Greek Μάνραλοι. The Marulat tribes are—Khunsag, Kaseruk, Hidatle, Mukratle, Ansokul, Karakhle, Gumbet, Arrakan, Burtuna, Anzukh, Tebel, Tumurga, Akhti, Rutul, Tshari, Belakan.

The Andi and Kabutsh are outlying members of this group. So are the Dido and Unso, whose districts lie as far south as the upper Samur.

The Kasi-kumuk lie to the east of the Koisu, in the Kara-kaitak district, and in part of Tabasseran.

The Akush and Kubitsh lie between the Koisu, the upper Manas, and the Buam; the Kura in South Daghestan.

The Lesgians are called

By the Circassians . *Hannoatshe.*
—— Tshetsh . . *Sueli.*

CHAPTER XLIV.

The Dioscurian Group.—The Tshetsh Division.—Grammatical Structure of the Tushi.

THE tribes of the next group occupy the watershed between the Kuban and the Terek, being an inland and central population; a population with affinities in the way of language which connect it with both its eastern and its western neighbours.

This population is called by the Russians Tshetshents by the Turks, Tsherkes, and by the Andi Lesgians, Mizdzhedzhi. One of their tribes is named Kisti, the Georgian name for their area being Kisteti. Guldenstadt has used this name as a general denomination for the whole group; for which he is blamed by Klaproth. The word, however, has the merit of being pronounceable, which is scarcely the case with the name of Klaproth's choice, Mizdzhedzhi. In the opinion of the present writer, Tshetsh, the Russian word divested of its non-radical elements, is the most eligible.

The Galga, Halha, or Ingush tribes of the Tshetsh, in contact with the Circassians of the Little Kabarda, are the most western members of the group. They call themselves Lamur, or Hillmen.

The second section is called

By themselves . .	*Arshte.*
— the Tshetshents .	*Aristoyai.*
— certain Turk tribes	*Kara-bulakh.*

They occupy part of the valley of the Martan.

The third section is that of the Tshetsh, or Tshetshents Proper, in contact with and to the east of the Arshte.

English.	Tshetsh.	Ingush.
Man (homo)	steg	stag
—— *(vir)*	maile	mairilk
Head	korte	korte
Hair	kazheresh	beshkenesh

Eight	bar	bar
Nine	ish	ish
Ten	itt	itt.

The Tushi lie on the upper Alasani, within, or on, the Georgian frontier. They are the only members of the Tshetsh group of whose language we know the grammatical structure; of which the following is a sketch.

The declension of the personal pronouns is as follows. With a slight modification it is that of the ordinary substantive as well.

Singular.	I.	Thou.	He.
Nominative	so	ḥo	o
Genitive	sai	ḥai	oẋu
———	———	———	ouẋ
———	———	———	oẋuin
Dative	son	ḥon	oẋun
———	sona	———	ouẋna
Instructive	as	aḥ	oẋus
———	asa	aḥa	oẋuse
———	———	———	ouẋse
Affective	sox	ḥox	oẋux
Allative	sogo	ḥogo	oẋugo
———	———	———	ouẋgo
Elative	soxi	ḥoxi	ouẋxi
———	———	———	oẋxi (?)
Comitative	soci	ḥoci	oẋuci
———	———	———	ouẋci
———	———	———	oẋci (?)
Terminative	sogomci	ḥogomci	ouẋgomci
Adessive	sogoh	ḥogoḥ	ouẋgoh
Ablative	sogredah	ḥogredah	ouẋgore
———	———	———	ouẋgoredah.

Plural.	We.		Ye.	Thou.
Nominative	wai	‘txo	ṡu	obi
Genitive	wai	‘txai	ṡui	oẋri
Dative	wain	‘txon	ṡun	oẋarn
———	———	———	ṡuna	———
Instructive	wai	a‘txo	aiṡ	oẋar
———	———	———	aṡi	oẋra
Affective	waix	‘txox	ṡuẋ	oẋarx
Allative	waigo	‘txogo	ṡugo	oẋargo
Illative	wailo	‘txolo	ṡulo	oẋarlo
Elative	waixi	‘tzoxi	ṡuxi	oẋarxi
Comitative	waici	‘txóci	ṡuci	oẋarci
Adessive	waigoh	‘txogoh	ṡugoḥ	oẋargoḥ
Inessive (c)	wailoh	‘txoloḥ	ṡuloḥ	oẋarloḥ
Ablative (c)	waigre	‘txogre	ṡugre	oẋargore
———	———	———	———	oẋardah
Elative (c)	wailre	‘txolre	ṡulre	oẋarlore
Conversive	waigoih	‘txogoih	ṡugoiḥ	oẋargoih.

That some of these forms are no true inflections, but appended prepositions, is speedily stated in the text.

Cardinal.	Ordinal.	Cardinal.	Ordinal.
1. cha	duihre	8. barl	barloġe
2. ṡi	silġe	9. iss	issloġe
3. x̣o	x̣alġe	10. itt	ittloġe
4. ahew	dhewloġe	11. cha-itt	cha-ittloge
5. ṗxi	pxilġe	12. si-itt	si-ittloġe
6. jeṫz	jeixloġe	19. ṭqeexç	iqeex̣cloġe
7. worl	worloġe	20. tqa	tqalġe.

This last word the author of the grammar connects with the word *tqo* = *also, over again* (*auch, wied, erum*) ; as if it were 10 doubled, which it most likely is. In like manner *tqeexc* is *one from twenty* = *undeviginti* :—

100 = pxauztqa = 5 × 20.
200 = içatatq = 10 × 20.
300 = pxiiæatq = 15 × 20.
400 = tquaziq = 20 × 20.
500 = tqaüzig̈ pxauztqa = 20 × 20 + 100.
1000 = sac tqauziqa icaiqa = 2 × 400 + 200.

The commonest signs of the plural number are *-i* and *-si*. The suffixes *-ne* and *-bi*, the latter of which is found in Lesgian, is stated to be Georgian in origin. No reason, however, against its being native is given.

In verbs, the simplest form is the imperative. Add to this *-a*, and you have the infinitive. The sign of the conditional is *he* or *h* ; that of the conjunctive *le* or *l*.

The tenses are—

(1.) Present, formed by adding *-a* or *-u* to the root : *i. e.* to the imperative form, and changing the vowel.

(2.) Imperfect, by adding *-r* to the present.

(3.) Aorist, formed by the addition of *-r* to the

(4.) Perfect ; the formation of which is not expressly given, but which is said to differ from the present in not changing the vowel. However, we have the forms *xet* = *find*, *xeti* = *found* (perf.) ; *xetin* = *found* (aorist). From the participle of the perfect is formed the

(5.) Pluperfect by adding *-r*.

(6.) The future is either the same as the present, or a modification of it.

I give the names of those moods and tenses as I find them. The language of the Latin grammar has, probably, been too closely imitated.

The first and second persons are formed by appending the pronouns either in the nominative or the instructive form.

The participle of the present tense is formed in *-in ;* as *dago* = *eat, dagu-in* = *eating.*

The participle of the preterite ends in *-no ;* as *xace* = *hear, xac-no* = *heard.*

There are auxiliary verbs, and no small amount of euphonic changes, of which one, more especially, deserves notice. It is connected with the gender of nouns. When certain words (adjectives, or the so-called verb substantive,) follow certain substantives, they change their initial. Thus, hatxleen *wa* = *the prophet is,* hatxleensi *ba* = *the prophets are,* waso *wa* = *the brother is,* wasar *ba* = *the brothers are.*

The nearest congeners of the Tshetsh are the Lesgians, and, without unduly raising the value of the group, they could be thrown in the same division. The same is probably the case with the populations who use the next forms of speech.

CHAPTER XLV.

The Dioscurian Group.—The Tsherkess, or Circassian, Division.

THE word *Circassian* is of Italian origin, and should be pronounced as if the initial *C* were *Tsh*—indeed, the word itself may be written (as it generally is written by foreign authors) *Tsherkess.* It is no native term; but one applied by the Turks and Russians. The really native names are Adigé and Absné; each denoting a different division of the population—no name at once collective and indigenous being known.

The Absné occupy the sea-coast between Sukhum-kaleh and the Straits of Yenikale, along with the valleys of the rivers that descend from the western slope of Caucasus. The Georgians call them Mibkhaz, and Abkhazi, their country being Abkhazeti. This ending in *-eti* appears and re-appears. It is the Georgian for *-land;* so that Abkhazeti is Abkhaziland. Word for word, Abkhazi is the Greek and Latin Ἀβασγοι and Abasci.

The Great Abaska-land, or Abkhazeti proper, extends from the frontier of the Adigé to Mingrelia and the Suan country—both Georgian. The six tribes of the Little Abaska-land call themselves Tepanta.

Word for word, *A-dig-é* is Ζήχοι, the name under which the author of the Periplus of the Euxine, written in the reign of the Emperor Hadrian, speaks of one of the tribes of the coast. In doing this, he places them east of their present locality; which is more inland, and lies to the north of the axis of Mount Caucasus, on the drainage of the Kuban.

The tribes of which the Adigé are the representatives, although now exclusively mountaineers, were, probably, once spread, more or less, over the plains to the north of the Caucasus, as well as over the hills and valleys of the great range itself. No wonder. Both Turks and Russians have encroached on their area, once larger than it is at present. More than one map of the fourteenth century carries a Circassian population from the Straits of Yenikale to the mouth of the Don, along the whole eastern coast of the Sea of Azof; and Klaproth believes that the present Kosaks of these parts are, more or less, Circassian in blood. Equally strong is the evidence to a Circassian population in the Crimea. The upper part of the river Belbek, in the south of that peninsula, is called Tsherkestüs, or the Circassian plain, to this day. On it stand the remains of the Tsherkes-kyerman, or Circassian fortress. But this may, possibly, represent an intrusion.

The *Adigé* dialects are (1.) the *Circassian Proper*; (2.) the *Besleneyevtsi*; and (3.) the *Kabardinian*.

Six	khi	ziba
Seven	ble	bishba
Eight	ga	akhba
Nine	bgu	ishba
Ten	pshe	zheba.

The languages of Caucasus have no near congeners; or, rather, their nearest congeners are remote. This is the case both on the north and the south side of the range. The Tsherkess stands as much by itself as the Armenian; the Armenian as the Tsherkess. No wonder. In the first place, the relations of the area are only bilateral; *i. e.* there are no frontagers on the Euxine, and the intrusion has been inordinate.

And it began betimes on its northern side. Centuries before the time of Herodotus the influx of Asiatic tribes into Europe had set in; and the level plains to the north of the Caucasus lay in their way, either as roads or as halting-places. The result of these movements was the enormous displacement represented by the term European *Scythia*. Concurrent with this would be the obliteration of anything in the shape of a northern prolongation of the Tsherkess and its congeners. Nor would any approach to the original *situs* be obtained until we reached the Mordvin frontier. Here we expect (and find) Caucasian affinities; but they are (as we expect them to be) few and faint.

Hence, the apex of the Dioscurian area is what a botanist would call *truncate; i. e.* it terminates abruptly along its whole northern boundary.

On each side, too, it ends abruptly. This is because it has the Caspian to the east, and the Black Sea to the west.

All the languages, however, are, there or thereabouts, *in situ;* a condition suggested by the mountainous character of the district.

On the south, the Persian, by which the Dioscurian area is bounded, is an encroaching language. On the south-east there is the Turk of Asia Minor, and, before that, there was the Greek. Originally, both the Georgian and Armenian must have extended much further in this direction. The ethnographical archæology, however, of Asia Minor is obscure.

With such geographical conditions the Dioscurian tongues seem much more isolated than they really are. Ugrian elements, however, have long been recognized in them; and lately Tibetan—this being what the *situs* and the displacements suggest.

On the other hand, the Persian affinities of the Iron have long been known; and it is possible that they are closer than the present writer makes them. Bopp has written upon those with the Georgian—though the conclusion at which he arrives, viz. that the latter language is what is called Indo-European, is denied by the present writer. If the Georgian be Indo-European, so many other tongues must be in the same category, as to raise the value of the class indefinitely, and to make it no class at all.

Upon the Persian and Armenian, more will be said in the sequel.

CHAPTER XLVI.

The Malay and its more immediate Congeners.—The Tshampa.—Samang.—Nicobar.—Silong.—Malay of the Malayan Peninsula.—Of Sumatra.—The Rejang and Lampong.—Of the Malagasi of Madagascar.—Of the small Islands off Sumatra.—From Java to Timor.

We now return to the frontier of the Môn of Pegu, the Kam of Kambojia, and the Thay of Siam. The continuity, which once existed between the first two, has been broken by the intrusion of the third. Hence, the forms of speech belonging to the Malayan Peninsula have no longer their nearest congeners with which they can be compared. This gives them the appearance of comparative isolation—but only the appearance.

If we treat the Malayan Peninsula as an island, all the languages of the group now coming under notice are insular, or, at any rate, Oceanic: with the single exception of the Tshampa, spoken along a strip of land on the coast of Kambojia.

English.	Tshampa.	English.	Tshampa.
Man	orang	*Sky*	langi
Head	ako	*Fire*	apoi
Eye	mata	*Water*	aya
Mouth	chabui	*River*	sungai
Sun	naharai	*Sea*	laut
Moon	bulan	*Stone*	batao.
Star	bintang		

Of the Peninsular forms of speech the most northern for which we have a specimen—is the *Samang*. It is also the rudest; the men who speak it being so dark in respect to their complexion as to have been classed among the Negritos.

English.	Juru Samang.	Kedah Samang.
Man	teunkal	tumkal
Woman	mabei	badon
Head	kala	kay
Eye	med	med

Sun	matai-alai	*Water*	awaen
Moon	bulan	*Stone*	batoe
Star	bituek	*Tree*	ki.

The Malay Proper, as far as several important points in its grammar go, is by no means very widely separated from the languages of the stock to which the Thay and its congeners belong. As far as the absence of declension and conjugation are concerned, both are in the same predicament. The Malay denotes gender by the addition of words meaning *male* or *female;* number by that of terms signifying *many;* case by prepositions —many of which are themselves nouns. The degrees of adjectives are equally expressed by circumlocutions. Verbs exhibit, as the equivalent to the signs of tense and mood, numerous separable and inseparable particles. Sometimes a singular noun is made plural by simple reduplication, as *orang orang* = *men.*

The phonesis, however, which gives so monosyllabic a character to the languages of the Continent, changes its character in the Archipelago. The vowel sounds are simple. Like those of the consonants, they are clean and clear as far as they go—which is not far. The sounds of the so-called aspirates, *f*, *v*, *th*, *dh*, *sh*, *zh*, are wanting—though the latter exist as compound sibilants, *tsh* and *dzh*—a phenomenon found elsewhere. The semivowels and liquids are prominent. So is the nasal *ng* (as in *king*), and the Spanish ñ. The former is often initial—which it never is in English. A Malay, for instance, says *ang;* but he can also say *nga*—the sound of the *ng* remaining the same in both cases.

The concurrence of consonants, in the same syllable, when both are mutes, is avoided—just as it was in the Fin.

The majority of the themes are dissyllabic, with the accent on the penultimate. All this gives the conditions of a soft and melodious language, with an easy intonation, and few harsh combinations. At the same time (as aforesaid) the inflection is at a *minimum.*

I am unable to give the exact locality from which the Malay Proper was derived. It is believed to have spread from Menangkabaw in Sumatra; but Mr. Craufurd remarks that the Menangkabaw form of speech, though truly Malay, was somewhat less so than some of the dialects of the Peninsula. The difference, however, between the Malay of commerce spoken with a difference in a given locality and the true provincial dialects of the same, has not been sufficiently attended to. The Malay of commerce is certainly, in many senses, a *lingua franca*. In distinction to the proper languages of the islands, it is spoken in Java, in the Moluccas, in Borneo, in Celebes, and elsewhere. It does not seem to have altered much since the time of Pigafetta, who, as a companion of Magalhaens, collected a Malay vocabulary. Its literature is scanty, consisting of little more than songs, tales, and unimportant histories. The language, however, of all is the same; and few archaic words occur. There are no inscriptions, no old manuscripts, no native alphabet—the one in use being the Arabic.

Of foreign elements, the Sanskrit, the Arabic, and the Telinga are the most important. Though rich in little songs and lyrics, the Malay metres are few and rude: the poetical element consisting in the idea rather than in the versification. The language boasts no classic.

English.	Malay.	English.	Malay.
Man (*homo*)	orang	*River*	kali
—— (*vir*)	lake laki	——	sungi

Sea	laut		

But though not a literary, the Malay is, as aforesaid, pre-eminently a commercial language. Hence, the details of the provincial dialects, as spoken by the *Orang Benua*, or the *Men of the Country*, in the Peninsula, though very important, are nearly unknown.

One of these is the Jakun.

Dead	mago	*Moon*	hantu-jahat
White	balhut	*Star*	cheong.
Black	hedjeaow		

The gambier seekers, like the Katodi of India, have a sort of slang of their own.

The occupants of the extreme North of *Sumatra* are the Orang Achi, or men of Achin; a town once famous and powerful, but now reduced, though still independent of the Dutch. The political limits of the State are unknown, or undefined. It is only certain that they have been contracted. The Dutch have encroached on the West; whilst, on the East, small independent States have been formed—Langkat, Balu China, Dili Sirdang, Batu Bara, and Asahan. The nearer the town, the greater the population. Of all the Sumatrans, the Orang Achi, or Achinese, are the most Arab. I do not mean by this that their Mahometanism is either purer, or more exclusive than that of the other Malays; inasmuch as upon this point I have no accurate information. I only mean that Arab manners and Arab modes of thought are more conspicuous in Achin than elsewhere. The amount of Arab blood, in the way of intermixture, is probably in proportion to the other Arab elements.

South of the Orang Achi lie the Orang Batta, or Battas, a population which has commanded more of the

attention of ethnologists than any other occupants of Sumatra. This is because they are cannibals ; and cannibals of a peculiar kind, under peculiar circumstances. They are cannibals and yet not Pagans. They are cannibals, and yet not without an alphabet. They are cannibals with either the germ or the fragments of a literature.

In respect to creed, the Battas are in the same class with some of the Orang Benua, who have adopted a certain amount of Hindúism without abandoning their original pagan creed. The exact proportion of the two superstitions is not easily ascertained. The Battas, however, seem to be both more Indian, and more Pagan, than the Johore tribes.

The Singkal, Pakpak, and Toba of the preceding tables are dialects of the Batta. The Banjak is spoken by the aborigines of a small island off the coast, who must be distinguished from a concurrent population of settlers from Atshin.

The Malays of *Menangkabaw* occupy the most favoured parts of Sumatra; *viz.* the drainage of the Indrajiri and Lake Sinkara. In one portion of their area the population is reckoned at 128 to the square mile; in another at 300, and even 400; an estimate which gives 385,000 for the whole Menangkabaw district.

Continued southward the mountain range of the Menangkabaw Malays becomes more and more impracticable; so that the details of its population are unknown. It is only known that it is Malay; and that it is thinly spread. Willer makes a separate division of it, containing the *Malays of Sapulo Bua Bandar*, and the *Malays of Gunong Sungu Pagu.*

South of these lies the country of the *Korinchi*, who differ from the Battas in being Mahometans, and from the Menangkabaw Malays in using an alphabet of Indian, rather than Arabic, origin—an alphabet not

identical with that of the Battas, though not unlike it in detail, and evidently of the same general character.

Whether the following list represent a Malay ; a native Sumatran, dialect, pure and simple ; a native Sumatran dialect modified by Malay influences ; or, so much Malay modified in Sumatra, is uncertain. The want of *data* for the solution of this question has just been indicated. The difference of alphabet tends to disconnect it with the Malay proper.

White	putih	*Star*	binta.
Black	ita		

The Southern Sumatrans, so far as they are of pure blood, are in the same category with the Korinchi ; *i. e.* they are Mahometans with alphabets different from that of the Koran, alphabets suggestive of a prior connection with India. Of these there are two ; the *Rejang* and the *Lampong*, allied in general character, yet different in detail ; allied, too, in general character to the Korinchi and Batta—different, however, in detail.

(1.)

English.	Rejang.	English.	Rejang.

Day	ranni	*Black*	mallum.
Night	binghi		

The Rejang alphabet is used by the Orang Serawi, and the Orang Palembang; the latter being only partially Sumatran. Javanese settlements now become numerous and important; and it is Javanese blood with which the proper Palembang population is largely crossed.

According to Zollinger the Lampong language is no original tongue, but a mixture of all the languages of its neighbourhood on a Malay basis. I doubt whether this be the exact explanation of the fact of its containing a notable proportion of Sunda, Javanese, and Bugis words, and but few peculiar ones. It is, probably, more or less, a transitional form of speech. It is strongly accented; words which are totally different from each other in meaning being distinguished only by either the quantity of the syllables, or their tone. This makes it difficult to write in European letters.

We now ask whether analogues of the rudest Orang Benua are to be found in Sumatra. The answer will be in the affirmative. That there is something older than the civilization of the Mahometan Malays is clear. There are the influences suggested by the Batta, Korinchi, Rejang, and Lampong alphabets. More than this, there are half-Pagan and half-Indian elements in the creeds of the Battas themselves. This, however, is scarcely the exact parallel to the true aboriginal condition of the rudest—the very rudest—Peninsular tribes. What is there that represents Sumatra before the advent of the Indians? There are two wild populations, one in the northern, one in the southern parts of the island, unknown to each other, and probably speaking mutually unintelligible languages.

The men of the northern division are known under the name, which the Battas give them, of Orang Lubu. They are found up the Mandau river above Siak.

The southern aborigines are the Orang Kubu; so-called by the people of Palembang, occupants of the jungle, rude and naked.

For the former we have specimens in two dialects.

English.	Lubu.	Ulu.

Now comes an area which, as a phenomenon in the distribution and dispersion of languages, is the most remarkable of all on the earth's surface. As a general rule, the populations and languages of islands are represented by those of the nearest continent. With the exception of Japan, where a continental congener of the Japanese is wholly wanting, and Iceland, which has taken its language from Norway rather than from Greenland, this is always the case. Britain dates from Gaul: the Canaries from the opposite coast of Africa: Sumatra from the Malayan Peninsula: Newfoundland from North America.

In conformance with this, Madagascar ought to have been peopled from Africa, and the Malagasi (or language of Madagascar) ought to find its nearest congeners on the coasts of Zanzibar and Mozambique. But it does not. The Malagasi is, essentially, a Malay language; and that it is so has long been known. The learned Reland knew it two centuries ago.

Whether it were the first language spoken on the island is another question.

There is no lack of statements to the effect that a second population, with black skins, crisp hair, and African features, is to be found in the island. But this may be found, to some extent at least, in the true Malay islands of the Indian Archipelago: and, in many cases where it is not found, it has been invented. I lay, then, but little stress on it.

Of African elements in the Malagasi none have been pointed out: though it should be added that few, with adequate knowledge, have made a search for them. Of the language itself, I *believe* that the dialects and sub-dialects are few. If so, we have a fact in favour of its comparatively recent introduction. This, however, is a point upon which our *data* are deficient.

The Malagasi grammar is much more complex and elaborate than the Malay, or (changing the expression) the Malay is much less elaborate and complex than the Malagasi. Humboldt has drawn attention to this, and

suggested that it is in the Philippine division of the Malay group that the origin of the Malagasi is to be sought. Mr. Craufurd has urged this as an argument against the reality of the affinity. It is, certainly, a fact which requires explanation—perhaps confirmation.

The western third of *Java* is the area of the *Sunda* language; the language of the district which gives its name to the Sunda Straits. The little that is written in the Sunda is written in the Javanese alphabet: the language itself being less cultivated, less ceremonial, and less studied by Europeans than the Javanese.

The *Javanese*, closely allied to the Malay Proper, is the most cultivated of all the tongues of the Archipelago. It has long been written; and that in a native alphabet. At present the creed is Mahometan: yet the alphabet, along with the literary influences, is other than Arabic.

The *Ngoko*, however, or natural vernacular, is used only between equals in rank. For the purposes of ceremony there is an artificial form of speech called the *Bhasa Krama*. This, with most especial care, avoids such terms as are not merely vulgar in the ordinary

acceptation of the word but current in common life; for which it substitutes paraphrases, archaisms, introductions from the Kawi, the Malay, and the like. In epistolary correspondence the ceremonial language is used even by superiors addressing their inferiors. In books it is mixed up with the *Ngoko*.

The learned language of Java—the analogue of the Sanskrit in India and the Pali in Ava—is known under the name of *Kawi;* a language in which there are numerous inscriptions and, at least, one long poem—the *Bratayuda* founded on the Sanskrit *Mahabarata.* The opinion of Sir Stamford Raffles, who first gave prominence to this remarkable dialect, was that the Kawi

language was Sanskrit modified by the vernacular Javanese. The opinion of Wilhelm von Humboldt, an opinion in which Mr. Craufurd agrees, is exactly the reverse. It makes the Kawi neither more nor less than archaic Javanese with an inordinate intermixture of Sanskrit.

The island Madura gives another variety: a variety falling into two divisions, the *Madura* Proper and the *Sumenap*. The language of *Bali* is closely allied to the Javanese. The alphabet is Javanese also. Bali, however, differs both from Java, and all the other islands of the Archipelago, in being, at the present moment, what it was before the extension of Mahometanism to Sumatra—Braminic and Hindú. The Kawi language in Bali is what the Arabic—the language of the Koran—is in Java. Nor is the native literature unimportant. It is partly Kawi, partly Balinese—just as, in the middle ages, the literature of Italy was partly Latin, partly Italian.

The language of Lombok—the *Sasak*—belongs to the same group as the Bali. Lombok, however, is Mahometan. What the Sasak contains in the way of literature is unknown.

Sumbawa contains two written and one unwritten form of speech. The *Sumbawa* Proper is written in the Bugis character. So is the *Bima*. This latter language, however, has also an alphabet of its own—little known, embodying next to nothing of a literature and bearing a general resemblance to those of Celebes and Sumatra. In Sumbawa the decided Malay character undergoes a modification and Bugis elements become somewhat prominent. The Sumbawa, however, and the Bima are as little Bugis, as they are Malay or Javanese, dialects.

Flores, or Ende, gives, according to Craufurd, no less than six forms of speech—the *Ende*, the *Mangarei*, the Kio, the Roka, the Konga, and the Galeteng. I only know the first two through any vocabulary. Like the

Timbora, the Mangarei has Australian elements. The Malay and Bugis words decrease. Neither is the language written. We are beyond the influences of Mahometanism as a predominant religion. We are (in the present state of our knowledge) beyond the influences of India, and its literature.

For *Timor* itself, although we have an amount of specimens of the most prevalent language, we are greatly in want of details, in the way of dialects. Yet there are few countries in which such details are more needed. Timor is the most eastern island of its range—as its name (which means *eastern*) implies. This makes it the nearest point in the ordinary Asiatic world to Australia. If this fact stood alone, it would be important. Still more important is it when taken in conjunction with the Australian elements in the Timbora, the Mangarei, and the Ombay vocabularies. For every one of them in these, we may expect two in Timor, *i. e.* in the languages which are the analogues to the Jakun in the Malay Peninsula, or the Ulu and Lobo in Sumatra. Such, doubtless, exist. What they are has to be learned.

East	timur	kimur
Hog	babi	wawr
Feather	bubi	wulu
Hot	panas	manah
Wrong	sala	hala
Hard	kras	kereh
Milk	susu	huhu
Wash	baso	baha
New	bharu	wohru.

In this prevalence of the sound of *k* we have a Polynesian characteristic.

CHAPTER XLVII.

Languages of Borneo, &c., to Ceram.

In Timor (for reasons which will appear in the sequel) it is convenient to finish the present group; having done which we go back to the longitude of Java, and move along the line of the Equator; in other words, we begin with a series of languages and dialects, for which the great island of *Borneo* is our starting-point.

In Borneo there is no native alphabet; yet there are traces in the aboriginal creeds, not only of Indian influences, but of Mahometan as well.

In Borneo there are numerous foreign elements, which vary with the district. As a rule, they attach themselves to the coast; but they differ with the different parts of it. On the west the Malays, on the south-east the Bugis, on the north the Sulu populations have made settlements.

All that belongs to the natives is, roughly speaking, unlettered and pagan. Where they have contracted decided maritime habits, they are *Biajuks*, *Biajús*, or *Bajows;* these terms being (generally) equivalent to *Orang Laut* = the *Men of the Sea.* The rudest among them have been called *Sea Gipsies.* Where they are river boatmen or landsmen they are *Dyaks;* though neither term can be taken absolutely. The division, then, between the two denotes a difference of habits rather than of blood.

The details for Borneo, until lately, were scanty. Since Labuan, however, has become English, they have increased. For the remainder of the island, the Dutch are our chief authorities; and it is probable (indeed certain) that the knowledge of what is to be found in Holland is, on the part of the present writer, very imperfect.

Dialects for the parts about Labuan from Sir J. Brooke.

Tongue	jila	*Fish*	masik
Teeth	knipan	*Egg*	tilo.
Hand	kama		

Celebes, in respect to our knowledge of its philological details, is more like Sumatra than Borneo; in other words, we have a fair amount of *data* for its numerous dialects.

English.	Mandhar.	Macassar.	Bugis.
Man(homo)	tau	tau	tawu
——(*vir*)	chacho	borani	horoani
Woman	bahini	bahini	makonrai
Head	ul	uluna	ulu

Stone	batu	batu	batu
Bird	manumanu	jang'anjang'an	manumanu
Egg	ndoh	bayu	iteloh
Fish	bale	juku	baleh.

The Bugis, like the Batta, the Korinchi, the Rejang, and the Lampong, has an alphabet, which, saving such exceptions as may be taken from the fact of its being common to five languages, is a native one, *i. e.* is neither decidedly Arabic like the Malay, nor decidedly Indian like the Javanese. It is Batta, &c. in its general character—not in its details. It embodies more of a literature than any of its congeners. I have before me a Bugis poem, on the hero of a recent war against the Dutch.

English.	Gunungtellu.	Menadu.

Bird	burung	koko
Egg	putitor	atelu
Fish	tota	pongkor.

The Menadu falls into numerous dialects, and sub-dialects; though, probably, into no more than several of its congeners. Its *minutiæ*, however, have been given in detail by A. J. F. Jansen, from whose paper the following short extract is taken as a specimen of the amount of variety which obtains in these parts.

English	*Man (homo)*	*Man (vir)*	*Sea*	*Wind*	*Rain*

Here ends the north-eastern line, from the extremity of which we return to the parts due north of Borneo, *i. e.* the Sulu Archipelago.

CHAPTER XLVIII.

The Languages of the Sulu Archipelago.—Philippines.—Formosa.

Of the dialects of the long island of Palawan, I know no specimens. They are probably *Sulu* like the following.

English.	Sulu.	English.	Sulu.
Man	ossoog	*White*	mapote
Head	oo	*Black*	maitom
Eye	mata	*Fire*	kalaryu
Ear	taingah	*Water*	tubig
Nose	ilong	*Stone*	bato
Hair	bohoc	*Bird*	manok
Teeth	nipun	*Egg*	iklúg
Hand	kamot	*Fish*	ista

Belly	tian	*Moon*	bulon
Bone	búkúg	*Star*	bitohon
Foot	siki	*Earth*	leopah
Day	hadlaou	*Black*	maitùm
Night	gabi	*Dead*	miatai nah.

In Mindanao the *Bissayan* falls into no less than five dialects. It changes again in Iolo, in Bohol, and in Samar where it approaches the *Tagala*. The Capul or Bissayan of the island of Abac falls into the Inabacnum dialect of the north, the Inagta of the south, and the General Language in which our authority Garcia de Torres preached and administered the sacraments.

The Bissayan of Panaz also falls into sub-dialects—one of which is the Hiligueina, the other the Haraya.

The Camarinos of the next group is the most

Bissayan of the class, and it is probably transitional. The Tagala is the language of the capital, Manilla. The Pampanga and the Iloco approach the Tagala. Of the Pangasinan I only know the name. The Zambali is a mountaineer, the Maitim a (so-called) Negrito, form of speech.

English.	Bissayan.	Iloco.	Cayagan.	Tagala.

For the *Bashí* islands, the following vocabulary is taken from E. Belcher's Voyage of the Samarang.

English.	Bashí.	English.	Bashí.
Head	ogho	*Moon*	bughan
Hair	buoc	*Earth*	madedah
Eye	mata	*Fire*	apui
Ear	titiduan	*Water*	danum
Belly	budek	*Egg*	ocloy
Bone	tughan	*Fish*	amon
Foot	cocon	*Black*	mabaghen
Day	arao	*Dead*	nadiman.

In *Formosa* we reach the end of the long series of languages akin to the Malay in this direction; for to the

north of Formosa the Japanese dialects begin. That a Malay form of speech was spoken in Formosa was known to Klaproth. That there were more forms of speech than one on the island was also known. Whether they were all Malay was another question.

Between 1624, and 1661, the Dutch occupied the island, and attempted not without a partial success, to introduce Christianity. The result was the *data* for what, until lately, was the only Formosan vocabulary known: one of the *Sideia* dialect. About twenty years ago, however, a *Favorlang* dictionary by Gilbert Happast, A.D. 1650, was discovered and published. This gave a second dialect—almost a second language.

A MS. discovered at Utrecht, and published by Vander Vlis, has supplied a sub-dialect of the Sideia, which, *inter alia*, gives a regular letter change between *r* and *s*.

English.	Klaproth's Formosan (*Sideia.*)	Vander Vlis.
Father	rama	sama
Mother	rena	sena
Water	ralaum	salong
Thunder	rungdung	singding
Tree	parannah	pesanach
Foot	rahpal	sapal
Great	irang	isang
Two	ranka	(so) soa.

It is reasonably suggested by Gabelentz that this is a specimen of a dialect, elsewhere called *Sakam*.

The *Tackais* and *Tiloes* are apparently dialects, or sub-dialects of the Favorlang.

Upon the Formosan languages, with the additions supplied to the original Sideia *data* by the Favorlang, we have a valuable monograph by Gabelentz; the authority for everything contained in the preceding, notice, which is not found in Klaproth. Its main object is the fixation of the places of the Formosan in the Malay class. Gabelentz decides that its affinities are in-

definite and miscellaneous, *i. e.* that it is not so decidedly Philippine as its geographical relations suggest. From this work, I take the following tables, which give twenty-four words out of one hundred and twenty-six. In the present work they serve a secondary purpose, viz., the elucidation of the general characters of the affinities which bind the several languages of the present group together. With the exception of *Guaham*, *Chamori*, *Yap*, *Ulea*, and *Satawal*, all the names have already been met with; so that, if the reader will remember that these are names for certain dialects from the Ladrone and Caroline archipelagoes, he will be sufficiently master of the nomenclature.

Whether this be the language of the *aborigines* of Formosa is doubtful. All that can be said is, that no sample of any second language is known.

CHAPTER XLIX.

Micronesia.—Tobi.—The Pelew islands.—The Caroline and Marianne (or Ladrone) Archipelagoes.—The Polynesia.

By Micronesia is meant everything between Gilolo and the Philippines on one side, and the Navigator's Islands, or Samoan Archipelago, on the other. The first steps in the passage are long ones, and the group is, to some extent, artificial.

For Tobi, or Lord North's Island, and the Pelew group; important as these islands are for any investigation which, like the present, derives Polynesia from Micronesia, and Micronesia from either the Philippines or the parts about Tidore and Gilolo, we have but scanty *data*.

English.	Tobi.	English.	Tobi.
Man	amare	*Moon*	mokum
Woman	vaivi	*Star*	uitsh
Head	metshemum	*Fire*	yaf
Hair	tshim	*Water* (*fresh*)	taru
Beard	kusum	—— (*salt*)	tat
Hand	kaimuk	*Stone*	vas
Foot	petchem	*Bird*	karum
Bone	tshil	*Fish*	ika.
Sun	yaro		

For the Pelew islands we have the following vocabularies, the first of which is from Marsden, the second from Keate's account of the islands.

English.	Pelew (1.)	Pelew (2.)
Man	arracat	masaketh
Head	pudeluth	botheluth
Eye	muddath	colsule
Nose	koyum	kiule
Beard	unwulel	ungelell
Hand	kurruel	kemark

English.	Pelew (1).	Pelew (2).
Blood	——	arrasaack
Day	kuguk	cúcúk
Night	kapisongi	kaposingi
Dead	mathe	mathee
White	kalelu	kellelu
Black	kaletori	cattetou
Fire	ngaou	karr
——	miul	——
Water	ralm	arral
Earth	kutum	——
Stone	——	path
Bird	kochayu	cockiyú
——	malk	——
Egg	——	niese
Fish	nikel	neekel
Sun	kioss	coyoss
Moon	puyur	pooyer
Star	beduk	bethuck
One	tang	tong
Two	urung	oroo
Three	othay	othey
Four	awang	oang
Five	aim	aeem
Six	lollom	malong
Seven	awith	oweth
Eight	ai	tei
Nine	etteu	etew
Ten	truyuk	tricook
——	magoth	makoth.

Few languages are more important than those of the small islands hereabouts. They should be compared not only with the Philippine, but the Formosan—with which the Pelew has some remarkable coincidences.

The typical languages of Micronesia are the following.

English.	Guaham.	Chamori.	Yap.	Ulea.	Satawal.
Man	lahe	lahi	pimohn	mamoan	mal
Woman	palawan	palauan	wupin	tabut	rabout
——	aga	——	——	——	faifid
Head	oulou	ulu	elingeng	methackitim	roumai
——	——	——	——	——	simoie
Hair	gapoun-oulu	gapunulu	lalügel	timui	aleroumai
——	——	——	——	——	timoi

English.	Guaham.	Chamori.	Yap.	Ulea.	Satawal.
Eye	mata	mata	eauteg	matai	metal
Nose	gouiinn	guihin	busemun	wathel	poiti
Tooth	nifin	ṇifin	mulech	nir	ni, gni
Tongue	oula	hula	athaeu	luel	laouel
Beard	——	atshai	rap	elsal	alouzai
Neck	agaga	hagaga	lügunag	uel	faloui

The Marianne islands are continued into the Kingsmill (Tarawan) group, and the Radack and Ralik chains; our scanty *data* for these being due to Mr. Hale, the philologue under Captain Wilkes in the United States Exploring Expedition.

(1.)

The practice of extending the *tabú* to words is Polynesian: *e. g.*, when a chief dies the use of such terms as are either identical with, or similar to, his name is forbidden. There is also, in the larger islands,

a kind of ceremonial language. That these are artificial elements is plain. They are elements, however, of which most languages show either the rudiments or the fragments.

In Basque we have a ceremonial conjugation. In South America there is more than one language where the women use one word, the men another; a fact which has been exaggerated into a pair of languages (one for each sex), with an explanatory hypothesis to match.

Bating, however, the facts of this kind, the Polynesian dialects are those wherein the artificial element is at zero. It is but lately that they have been written at all: nor were they, before the introduction of the present missionary influences, in either direct or indirect contact with any languages more cultivated than themselves. For the phenomena, then, of a thoroughly natural and spontaneous development they are materials of pre-eminent value.

CHAPTER L.

The Papua Class.—Guebe, &c.—New Guinea.—New Ireland, &c., to New Caledonia.

In making the Malay division end at Ceram, and the Papua begin at Guebe, I chiefly consult convenience; inasmuch as, along the line of contact, there are notable signs of transition.

From the small Archipelago, at the north-western extremity of New Guinea, and from New Guinea itself, the line of Papua languages runs south and south-east, *viâ* New Britannia, New Hanover, New Ireland, the Solomon Islands, &c., Mallicollo, Erromango, Tana, Erronan, Annatom, to New Caledonia. The Louisiade Archipelago is also Papua; as are the islands in Torres Straits—*i. e.* they are Papua rather than Australian. Twenty years ago, the languages of this class were all but unknown, not one of them having ever been reduced to writing, or even learned by an educated European. That no Hollander ever spoke any of the dialects of the north-western coast of New Guinea cannot indeed be asserted unconditionally—though the doctrine *de non apparentibus*, &c., suggests that such was the case. Nothing, however, of any importance concerning them was communicated to the world at large. Of the Tana language, a MS. grammar by Mr. Heath had been inspected by Dr. Prichard, who stated that the language which it represented differed entirely from

the Polynesian. It abounded with inflections, and had a peculiar form by which *three* persons were spoken of—a form distinct from the dual, and distinct from the plural, a form for which the term *trinal* was suggested.

The little knowledge involved in these fragmentary facts, created a tendency to put a high ordinal value on the characteristics of the Papua grammar; a value in which there is, probably, a certain amount of exaggeration.

Beginning with the language of the small island of *Guebé*, which lies somewhat nearer to Gilolo than to New Guinea, we find in the following vocabulary, at least, a notable difference between it and the *Waigiú* spoken immediately under the Equator and within sight of the mainland of New Guinea itself.

English.	Guebé.	Waigiú.
Man	syniat	——
Woman	pine	——
Head	kouto	kagala
Eye	tam	——
**Eyes* (?)	tadji	jadjiemouri
Nose	kassugnor	soun

Arm	kamer	kapiani
Hand	fadlor	konkafeni
Back	——	kouaneteni
Foot	——	kourgnai
Skin	kinot	rip
Sun	astouol	——
**Fire*	ap	——
Sea	tasfi	——

English.	Guebé.	Waigiú.
* *Water (fresh)*	aer omissi	——
* *Bird*	mani	——
* *Fish*	hin	——
One	pissa	——
Two	pilou	——
Three	pitoul	——
Four	piffat	——
Five	pileme	——
Six	pounnoun	——
Seven	piffit	——
Eight	poual	——
Nine	pissiou	——
Ten	otsha	——

The Papuan Proper is chiefly known from the parts about Port Dorey; where the first of the following vocabularies was collected by Forrest, as early as A.D. 1774–1776.

English.	Papuan.	Arago.
Man	sononman	snone
Woman	binn	biene
Head	——	vrouri
Eye	——	tadeni
——	——	grarour
Mouth	——	soidon
Tooth	——	nacoere
Tongue	——	ramare
Ear	——	kanik
Hand	——	konef
Arm	——	bramine
Leg	——	oizof
Foot	——	oibahene
Blood	——	riki
Day	——	ari
Sun	rass	rias
Moon	hyck	——
Star	mak	——
Fire	for	afor
Water	war	ouar
—— (*salt*)	warmassin	——
—— (*sweet*)	warimassin	——
River	warbike	——
Sea	——	sorene
Rain	——	meker
Fish	èen	iene

English.	Papuan.	Arago.
Bird	moorsankeen	man (?)
——	——	bourore
Hog	ben	baine
Tree	kaibus	——
House	rome	rouma
Egg	——	bolor
——	——	samoure
Hill	bon	——
Sand	yean	iene
White	pepoper	——
Black	pyssin	——
One	oser	ossa
Two	serou	serou
Three	keor	keor
Four	tiak	tiak, fiak
Five	rim	rime
Six	onim	oneme
Seven	tik	sik, fik
Eight	war	ouar
Nine	siore	siore
Ten	samfoor	samefour.

Taking the numerals as a test, the Archipelago and the neighbourhood of Port Dorey give a multiplicity of sub-dialects.

(1.)

English.	Aropin.	Tandia.	Dasen.
One	wosio	nai	joser
Two	woroe-o	roesi	socroe
Three	woro	toeroesi	toroe
Four	woako	attesi	ati
Five	rimo	marasi	rembi
Six	rimo-wosie	marasimge	rimbi-oser
Ten	sagoero	oetin	arisa.

(2.)

English.	Jower.	Wandamin.	Arfak.
One	re-be	siri	woam
Two	re-doe	mondo	jan
Three	re-oe	toro	kar
Four	re-a	at	tar
Five	brai-a-re	rim	maswar
Six	brai-a-rebe	rimmasiri	kaswar
Ten	brai-a-redoe	rimmasoerat	marswar.

(3.)

English.	Omar.	Insam.	Amberbaki.
One	kotim	keteh	toe
Two	redis	roesi	ker
Three	etirom	korisi	noer
Four	eat	aka	boat
Five	matisi	rima	mer
Six	kolim	keteh	ebetoe
Ten	maptides	boeki, roesi	onger.

(4.)

English.	Karon.	Pome.	Seroci.	Moor.
One	dik	korii	bo-iri	tata
Two	we	koiroe	bo-roe	roeroe
Three	gre	toro	bo-toro	oro
Four	at	at	bo-ah	ao
Five	mik	rim	rim	rimo
Six	mak	ona	boiri-kori	rimo-tata
Seven	fret	itoe	bor-kori	roeroe
Eight	ongo	waro	botd-kori	oro
Nine	masiwo	isioe	boa-kori	ao
Ten	mesoe	awrah	soerat	toverah.

(5.)

English.	Hillmen, to the West of Amsterdam, and Middleburgh.	Ron.	Beak & Mefur.
One	mele	joser	sai
Two	ali	noeroe	doei
Three	told	'ngo-kor	kior
Four	fak	fak	fiak
Five	mafoek	lim	lim
Six	maflenene	onim	onim
Seven	ane-mele	onememaeroe	tiek
Eight	ali	onemegnokor	war
Nine	tolo	onenfak	siew
Ten	feh	onemerim	samfor.

(6.)

English.	Ansoes.	Salawatti.
One	koiri	sa
Two	korisi	rœ
Three	todoe	tor
Four	moano	fat
Five	di	rim
Six	wona	onim
Seven	itoe	fiet
Eight	india toro	war
Nine	india ato	si
Ten	hoera	lafa.

The following vocabularies are from the south and west, being chiefly spoken on the coast.

English.	Lobo.	Utatanata.
Man	marrowane	marrowane
Woman	mawinna	——
Cheeks	wafiwiriongo	awanu
Eyes	matatongo	mame
Hand	nimangouta	toemare
Head	umun	oepauw
Arms	nimango	too
Back	rasukongo	urimi
Belly	kamborongo	imau
Foot	kaingo	mouw
Hair	monongfuru	oeirie
Mouth	oriengo	irie
Nose	sikacongo	birimboe
Neck	garang	ema
Tongue	kariongo	mare
Teeth	riwotongo	titi
Sun	orak	——
Water	malar	warini
Rain	komak	komak
River	walar nabetik	warari napettike
Bird	manoe	——
Hog	búi	oe
Island	nusu	——
Tree	akajuakar	kai
Bow	——	amuré.

English.	Triton Bay.	Mairassis.	Onim.
Man	marowana	iohanouw	——
Head	monongo	nangoewoe	onimpatin
Hair	monongfoero	nangoekatoe	ampoewa
Eye	matatongo	namboetoe	matapatin
Nose	sikaiongo	nambi	wirin
Mouth	oriengo	naros	soeman
Tooth	roewatongo	sifa	nifin
Hand	nimangoeta	okorwita	——-
Foot	——	——	nimin kaki
Sun	orah	ongoerah	rera
Moon	foeran	foeran	poenono
Earth	ena	gengena	gai
Fire	iworo	api	——
Water	walar	wata	weari.

For the islands of Torres Straits, viz.: the Darnly

Islands (Erroob and Maer) and the Murray Islands, vocabularies in the appendix to Juke's Voyage of the Fly give somewhat full specimens. The tables in which they appear show the difference between the South Papua and the North Australian. It is a difference, however, which is easily exaggerated; as in the first seventeen words we find the following coincidences.

English.	Papua.	Australian.
Cheek	bag	bag
Eye	illcap	danacap
Eyelid	illcamush	——
Eyelash	——	dammuche
Ear	gereep	coora
Nose	peet	peechi.

The collective name for the Erroob, Maer, and Massied forms of speech is Miriam.

The Redscar Bay, Dufaure Island, and Brumer Island dialects are known through the vocabularies of the Rattlesnake, collected by Macgillivray. They are allied to each other—the latter being very closely allied to the Duchâteau Island of the Calvados, and the Brierly Island of the Louisiade, group.

English.	Erroob.	Redscar Bay.
Man	kaimeer	tau
——	lammar	——
Woman	koskeer	——
——	mada	ahine
Child	kaþelli	mero
Head	kerim	kwara
Eye	irkeep	mata
Ear	laip	taiya
——	pell	——
——	gereep	——
Nose	peet	uda
Mouth	nuga	mao
——	tae	——
Lips	meet	pipina
Teeth	tirreg	isi
Tongue	werrút	mala

English.	Erroob.	Redscar Bay.
Hair	moos	hui
Neck	perreg	——
Hand	tag	ima
Foot, or Leg	taertar	——
——	gab	——
Blood	mam	——
Sky	baz	garewa
Sun	gegger	mahana
Moon	maeb	nowarai
Star	waer	——
Fire	úra	kaiwa
Water (fresh)	nea	goila
—— *(salt)*	goor	arita
Stone	bakeer	weu
Wind	wag	——
Sea	carrem	——
Sand	wae	geragera
Tree	igger	——
I	cai	——
Mine	cara	——
Thou	ma	——
Your	mara	——
One	netat	ta
Two	naes	rua
Three	naesa netat	toi
Four	——	hani
Five	——	ima.

Here we leave the southern, and returning to the parts about Waigiú, follow the northern, eastern, or north-eastern line.

English.	New Ireland.	Port Praslin.
Head	púklúk	——
Ear	pralenhek	palalignai
Eye	matak	mata
Hair	iuk	epiu
Beard	kambissek	katissende
Nose	kambussuk	mbussu
Mouth	lok	mlo
Tooth	insek	ninissai
Tongue	karmea	kermea
Arm	limak	——
Finger	oulima	lima
Neck	kondaruak	kindurua
Back	taruk	plaru

English.	New Ireland.	Port Praslin.
Foot	balankeke	pekendi
Sun	kamiss	——
Moon	——	kalan
Fire	——	bia
Water	malum	molum
Sea	——	bun
Bird	manuk	——
Fish	siss	sis.

Bauro, or San Christoval, along with Guadalcanar, belongs to the Solomon Islands. The Rev. J. Patteson's First Attempt in the Bauro Language gives us our materials, which consist of the Lord's Prayer, two short prayers, and a catechism concerning the Fall of Man and his Redemption.

English.	Bauro.	English.	Bauro.
Man (*homo*)	inone	*Sky*	aro
—— (*vir*)	sai	*Moon*	hura
Woman	urao	*Water*	wai
Hand	rima	*House*	oma
Day	dangi	*Tree*	hasiai.

English.	Guadalcanar.	English.	Guadalcanar.
Man (*homo*)	inoni	*Sit*	tooru
—— (*vir*)	mane	*I*	inau
Woman	kene	*Thou*	io
Father	amma	*He*	ia
Son	gare	*Thine*	amu
Child	mare	*His*	ana
Good	siene	*One*	tai
Bad	tös	*Two*	arua
Die	mai	*Three*	oru.
Hear	noro		

In Vanikoro, three languages are spoken.

English.	Vanikoro.	Tanema.	Taneamu.
Man	lamoka	ranuka	amualigo
Woman	verume	ranime	vignivi
Beard	úngúme	kole	vingumia
Arm	me	menini	maini
Tooth	ugne	kole	indzhe

English.	Vanikoro.	Tanema.	Taneamu.
Mouth	ugrenili	——	——
Tongue	mea	mia	mimiae
Hair	wennbadzha	valanbadzha	valanbadzha
Back	dienhane	delenana	diene
Leg	kelenili	alenini	aeledà
Moon	mele	——	——
Fire	nebie	gnava	iaua
Water	wire	nira	ero.

The next two vocabularies are from the New Hebrides.

(1.)

English.	Mallicollo.	English.	Mallicollo.
Man (homo)	nebök	*Bird*	moero
—— *(vir)*	bauenunk	*Fish*	heika
Woman	rambaiuk	*One*	sikai
——	rabin	*Two*	e-ua
Father	aramomau	*Three*	e-roi
Child	urare	*Four*	e-vatz
Head	basaine	*Five*	e-rima
Eye	maitang	*Six*	su-kai
Ear	talingan	*Seven*	whi-u
Tooth	rebohn	*Eight*	oroi
——	warrewuk	*Nine*	whi-vatz
Nose	noossun	*Ten*	singeap.
Hair	membrun baitang		

(2.)

English.	Tana.	English.	Tana.
Man	aremana	*Sea*	tasi
Woman	peran	*Good*	masan
Father	rumune	——	aumasan
Son	mati	——	ratutakat
Body	nupuran	*Bad*	ellaha
Heart	reren	*Holy*	ekenan
Sun	mere	*Great*	asori
Moon	maukua	*Many*	repuk
Bird	manu	*Eat*	ani
Fish	namu	*Speak*	mani
Tree	nei	——	mankeari
Fire	nāp	*Hear*	matareg.
Earth	tana		

The Gospel of St. Luke in *Annatom* was published in 1852, by the Rev. J. Geddie; and in 1853, that of St. Mark in Sydney. These, along with other external confluences, have introduced—

From the Greek.

Agelo	*angel*	Aprofeta	*prophet*
Areto	*bread*	Sito	*wheat*
Apeitome	*circumcision*	Baptizo	*baptize.*

From the English.

Süp	*sheep*	Pigad	*peg*
Flaur	*flour*	Leven	*leaven*
Mint	*mint*	Ru	*rue*
Waina	*wine*	Kot	*coat*
Mune	*money*	Apalse	*palsy.*
Wik	*week*		

English.	Annatom.	English.	Annatom.
Man	atimi	*Day*	adiat
Husband	atumnya	*Sun*	nagesega
Wife	ehgai	*Moon*	mahoc
Woman	takata	*Star*	moijeuw
Head	nepek	*God*	Atua
Hair	umri idjini	*Wind*	nimtinjop
Eye	esganimtai	*Rain*	incopda
Ear	intikgan	*Fire*	caup
Nose	ingedje	*Water*	wai
Mouth	nipjineucse	*Sea*	unjop
Tongue	namai	*Stone*	hat
Tooth	nijin	*Land*	obohtan
Hand	ikma	*Rock*	elcau
Finger	nupsikma	*Hill*	lo-la eduon
Foot	eduon	*Dog*	kuri
Blood	unja	*Bird*	man
Sky	nohatag	*Fish*	mu.

With the Polynesian and Malayan languages in general, the Annatom has, at least, the following words in common—

English.	Annatom.	
Water	wai	wai—*Endé*
Fire	caup	api—*Guebé*
Bird	man	mani—*Guebé*
Tooth	nijin	nihi—*Endé*
Foot	eduai	ldi—*Bima*
Die	mas	mati—*Malay*
House	eom	umah—*Javanese*

Dog	kuri	kuri—*Ticopia*
Kava	kava	kava—*Polynesia.*

Words like *aktaktai, epto, eropse, esvi, inwai, inpas, inridjai, imtak, uctyi, imiisjis, intas, eucjeucjaig, injop,* &c., show that the Annatom phonesis is less vocalic than that of the other islands.

In Erromango there are, at least, two dialects; apparently three—the third the common language of the island at large, or its central districts.

English.	Northern Dialect.	Southern Dialect.
Man (homo)	neteme	yirima
Woman	nasivin	yarevin
Sky	unpokop	nimpokop

Hand	aranine		

In *New Caledonia*, the language of Cape Queen Charlotte is known under the name of *Baladea;* for

which Gabelentz would substitute the native name *Duaura*. A small tract published in Rarotonga, in 1847, gives us the main materials for this dialect; it consists of passages from the Bible, and either represents the language imperfectly or the language is inadequate to the translation. The sounds of *f*, *l*, *h*, and *s*, are wanting. Many of the roots are monosyllabic; many, apparently, dissyllabic, the concurrence of consonants being rare. Its proper inflection is of the scantiest. It uses prefixes as well as suffixes; suffixes as well as prefixes.

English.	Baladea.	English.	Baladea.
Man	ngauere	*God*	Intu

English.	Isle of Pines.	Yengen.
One	ta	hets
Two	vo	heluk
Three	veti	heyen
Four	beu	pobits
Five	tahue	nim
Six	nota	nimwet
Seven	nobo	nimweluk
Eight	nobeti	nimweyen
Nine	nobeu	nimpobit
Ten	nokau	painduk.

Uea, though one of the Loyalty Islands, is not altogether like the rest of the Papuan districts. Its name, even, is foreign ; *Uea* being the native term for Wallis's Island. From this, one of its three languages is

* Or *Nitendi.*

stated to have been introduced; the present speakers of it being the descendants of settlers of uncertain date. Of the two other forms of speech, one is from New Caledonia the other (that of the following specimen) native.

English.	Uea.	English.	Uea.
One	pacha	*Six*	*lo*-acha
Two	lo	*Seven*	*lo*-ala
Three	kun	*Eight*	*lo*-kunn
Four	thak	*Nine*	*lo*-thak
Five	thabumb	*Ten*	*te*-bennete.

In like manner *Fotuna*, though belonging to the New Hebrides, is Polynesian, rather than Papuan, in speech; the language being more especially akin to that of Rarotonga. Again—in some parts of *Fate*, or Sandwich Island, a Polynesian dialect is spoken. Thirdly, in *Mau*, to the north-east of Fate, the people speak the Maori, *i. e.* the language of New Zealand.

CHAPTER LI.

The Viti, or Fiji, Group.—Its Relations to the Polynesian and the Papua.

FOR reasons which will appear in the sequel, the *Fiji* or *Viti* is given in a chapter by itself.

The Fiji or Viti Archipelago extends from 16° to 2° S. L. and from 177° to 182° W. L. The islands themselves amount to more than 200: of which not less than 100 are inhabited. Vanua Levu and Viti Levu are supposed to contain 40,000 individuals each. The remaining population, spread over the smaller islands, may amount to 90,000 more. The language, however, is the same throughout: though dialects and sub-dialects are to be expected. The chief of these are those of Lakemba, or the Windward Islands, Somosomo, Vewa, Inbau, and Rewa.

The following list, from Gabelentz, shows the extent to which its vocabulary agrees with the Malay and Polynesian.

English.	Fiji.	Malay and Polynesian.

Drink	unuma	umni
Die	mate	mas
Two	rua	ero
Who	dhei	di
They	era	ara
To	vei	vai.

Upon the grammatical relations of this important language more will be said in the sequel.

CHAPTER LII.

The Australian Group.

THE isolation of the Australian languages has often been insisted on. Yet they have not only miscellaneous affinities but three vocabularies (1.) the Ombay; (2.) the Mangarei; and (3.) the Timbora, have, for some years, been pointed* out as vocabularies from the Malay area with decided Australian affinities.

The definite line of demarcation which is drawn between them and the Papuan of New Guinea is impeached by the Erroob and Darnly Island vocabularies of Jukes; not to mention those of Macgillivray from the Louisiade Archipelago.

The fact that, notwithstanding the mutual unintelligibility of the majority of the forms of speech of which we have specimens, combined with the fact of these being numerous, the languages for the whole of Australia form but one class, has been urged by Grey, Threadkeld, the present writer, and others—by all upon independent researches. Upon the *value*, however, of the class, but little criticism has been expended.

Affinities, especially in respect to grammatical structure, with the Tamul languages have been indicated by Norriss. I doubt, however, whether they are the nearest—indeed, I think that indirect relationship and a

* Appendix to Jukes's Voyage of the *Fly* by the present writer.

real or apparent partial coincidence in respect to the stage of their development is all that the comparisons warrant.

The numerals are on the low level of those of South America—rarely reaching *five;* generally stopping at *three.*

Beginning with the north, and more particularly with the parts about the Gulf of Carpentaria, we have—

(1.)

English.	Cape York.	Massied.	Gudang.	Kowrarega.
Head	——	——	pada	quiku
Eye	dana	dana	dana	dana

Tree	tarevelok	*Three*	taan.
Egg	kirkai		

Some (at least) of the Australian languages are named after the word meaning *No ;* so that the *Kamilaroi*, the *Wolaroi*, the *Wailwun*, the *Wiralhere*, and the *Pikabul*, take their designations from their negatives ; these being *kamil*, *wol*, *wail*, *wira*, and *pika*, respectively. If this nomenclature be native it is remarkable. In Italy and France the same principles prevailed in the twelfth century. In the early stages, however, of rude languages it has yet to be discovered beyond the area now under notice.

The following are paradigms for the Kamilaroi :—

mute, an opossum.
mutedu, an opossum (agent).
mute-ngu, of an opossum.
mute-go, to an opossum.
mute-di, from an opossum.
mute-dā, in an opossum.
mute-kunda, with an opossum.

ngaiă, I.	*ngulle*, thou or you, and I.	*ngēănĕ*, we.
ngai, my.	*ngullina*, he and I.	*ngeane-ngu*, of us.
ngaiago, to me.	*ngulle-ngu*, belonging to you and me.	*ngeane-go*, to us.
ngaiadī, from me.		*ngeane-di*, from us.
ngaiada, in me.	*ngullina-ngu*, belonging to him and me.	*ngeane-da*, in us.
ngaiakūnda, with me.	*ngulle-go*, to you and me, &c. &c.	*ngeane-kunda*, with us.
ngunnunda, me.		
inda, thou.	*indālĕ*, ye two.	*ngindai*, ye.
inda-ngu, or *nginnu*, } thy.	*indale-ngu.*	*ngindai-ngu*, &c.
inda-go, to thee, &c.	*indale-go*, &c.	

ngīrmă, he, she, or that.
numma or *ngubbo*, this. *ngūruma*, that (iste). *ngirma* or *ngutta* } that (ille).
ngārmă, they.
andi ? who ? *mĭnnĭma ?* which ? *minna* or *minya?* what ?
ngaragēdūl or *ngaragē*, another. *kānungo*, all.

gīr bumalngē, did beat *to-day*.
gir bumalmĭēn, did beat yesterday.
gir bumallēn, did beat some days ago.

bumalda, is beating.
bumalle, will beat.
bumalngărī, will beat *to-morrow*.

bumaldai, beat (as *yelle inda bumaldai*, if you beat).
bumallago, to beat.

bumalla, strike.
bumallawā, strike (emphatic and earnest).
bumalmia, strike (ironical—"*if you dare*").

bumaldendai, beating; *bumalngendai*, having beaten; *bumalmiendai*, having beaten yesterday; *bumallendai*, going to beat.

In a systematic and general work like the present, wherein it is scarcely possible for the writer to treat each part of the subject with the care demanded by a special monograph, I may be excused for giving some extracts from certain papers, of comparatively distant dates, bearing upon certain parts of the subject—papers written when our *data* were scantier than they are at present, and papers of which the object was less to prove certain points, than to prepare the way to the breaking-down of several arbitrary lines of separation and to draw attention to the over-valuation of certain isolated characters.

And first in respect to the affinities between the Australian languages taken in mass among themselves.

That the Australian languages are one (at least in the way that the Indo-European languages are one), is likely from henceforward to be admitted. Captain Grey's statement upon the subject is to be found in his work upon Australia. His special proof of the unity of the Australian languages is amongst the unprinted papers of the Geographical Society. The opinions of Threlkeld and Teichelmann go the same way. The author's own statements are as follows :—

(1.) For the whole round of coast there is, generally speaking, no vocabulary of sufficient length that, in some word or other, does not coincide with the vocabulary of the nearest point, the language of which is known to us. If it fail to do this it agrees with some of the remoter dialects. Flinder's Carpentarian, compared with the two vocabularies of the Endeavour River, has seventeen words in common. Of these, three (perhaps four) coincide. Eye, *meal*, C.; *meul*, E. R.: hair, *marra*, C.; *morye*, E. R.: fingers, *mingel*, C. *mungal bah*, E. R.: breast, *gummur*, C.: *coyor*, E. R.

Endeavour River.—Two vocabularies.—Compared with the vocabularies generally of Port Jackson, and the parts south and east of Port Jackson :—Eye, *meul*, E. R.; *milla*, Limestone Creek : nose, *emurda*, E. R.: *morro*, L. C.: ears, *mulkah*, E. R.; *moko*, Port Macquarie : hair, *morye*, E. R.: *mundah*, Burra Burra : breast, *coyor*, E. R.: *kowul*, Port Jackson : fingers, *mungal bah*, E. R.: *maranga*, B. B.: elbow, *yeerwe*, E. R.: *yongra*, Menero Downs : nails, *kolke*, E. R.; *karungun ?* P. J.: beard, *wollar*, E. R.: *walo*, Jervis's Bay ; *wollak*, Port Macquarie.—The number of words submitted to comparison—twenty two.

Menero Downs (Lhotsky), and *Adelaide* (G. W. Earl).—Thirteen words in common, whereof two coincide.

English.	Menero Downs.	Adelaide.
Hand	morangan	murra
Tongue	talang	taling.

Adelaide (G. W. Earl) and *Gulf St. Vincent* (Voyage de l'Astrolabe).

English.	Adelaide.	Gulf St. Vincent.
Beard	mutta	molda
Ear	iri	ioure
Foot	tinna	tenna
Hair	yuka	iouka
Hand	murrah	malla
Leg	irako	ierko
Nose	mula	mudla
Teeth	tial	ta.

Gulf St. Vincent (Voyage de l'Astrolabe) and *King George's Sound* (Nind and Voyage de l'Astrolabe); fifty words in common.

English.	Gulf St. Vincent.	King George's Sound.
Wood	kalla	kokol
Mouth	ta	taa
Hair	iouka	tchao
Neck	mannouolt	wolt
Finger	malla	mal
Water	kawe	kepe
Tongue	talein	talen
Foot	tenna	tchen
Stone	poure	pore
Laugh	kanghin	kaoner.

(2.) The vocabularies of distant points coincide ; out of sixty words in common we have eight coincident.

English.	Jervis's Bay.	Gulf St. Vincent.
Forehead	holo	ioullo
Man	mika	meio
Milk	awanham	ammenhalo
Tongue	talen	talein

English.	Jervis's Bay.	Gulf St. Vincent.
Hand	maramale	malla
Nipple	amgnann	amma
Black	mourak	pouilloul
Nails	berenou	pere.

(3.) The most isolated of the vocabularies, *e. g.* the Carpentarian, if compared with the remaining vocabularies, taken as a whole, has certain words to be found in different and distant parts of the island.

English.	Carpentarian.	Limestone Creek.
Eye	mail	milla
Nose	hurroo	morro.

The following is a notice of certain words coinciding, though taken from dialects far separated :—

Lips	tambana,	Menero Downs	tamande,	G. S. V.
Star	jingi,	*ditto*	tchindai,	K. G. S.
Forehead	ullo,	*ditto*	ioullo,	G. S. V.
Beard	yernka,	*ditto*	arnga, nanga,	K. G. S.
Bite	paiandi,	*ditto*	badjeen,	*ditto*
Fire	gaadla,	*ditto*	kaal,	*ditto*
Heart	karlto,	*ditto*	koort,	*ditto*
Sun	tindo,	*ditto*	djaat,	*ditto*
Tooth / *Edge*	tia,	*ditto*	dowal,	*ditto*
Water	kauwe,	*ditto*	kowwin,	*ditto*
Stone	pure,	*ditto*	boye,	*ditto.*

(4.) The extent to which the numerals vary, the extent to which they agree, and the extent to which this variation and agreement are anything but coincident with geographical proximity or distance, may be seen in the following table :—

English.	*One*	*Two*	*Three*
Moreton Bay	kamarah	bulla	mudyan
——— *Island*	karawo	poonlah	madan
Bijenelumbo	warat	ngargark	2+1
Limbakurajia	erat	ngargark	do.
Terrutong	roka	oryalk	do.
Limbapyu	immuta	lawidperra	2+1
Kowrarega	warapune	quassur	do.
Gudang	epiamana	elabaio	do.
Darnley Island	netat	nes	do.
Raffles Bay	loca	orica	orongarie
Lake Macquarie	wakol	buloara	ngoro
Peel River	peer	pular	purla

English.	*One*	*Two*	*Three*
Wellington	ngungbai	bula	bula-ngungbai
Corio	koimoil	——	——
Jhongworong	kap	——	——
Pinegorine	youa	——	——
Gnurellean	lua	——	——
King George's Sound,	keyen	cuetrel	murben
Karaula	mal	bular	culeba
Lachlan, Regent Lake	nyoonbi	bulia	bulongonbi
Wollondilly River	medung	pulla	colluerr.

(5.) In respect to the *vocabularies*, the extent to which the analysis which applies to the grammar applies to the vocables also may be seen in the following instance. The word *hand* Bijenelumbo and Limbapyu is *birgalk.* There is also in each language a second form—*anbirgalk*—wherein the *an* is *non-radical.* So, also, is the *alk;* since we find that *armpit=ingamb-alk*, *shoulder=mundy-alk*, and *fingers=mong alk.* This brings the root=*hand* to *birg.* Now this we can find elsewhere by looking for. In the Liverpool dialect, *bir-il=hand*, and at King George's Sound, *peer=nails.* The commonest root=*hand* in the Australian dialects, is *m-r*, *e.g.*:—

Moreton Bay	murrah	*Corio*	far-onggnetok
Karaula	marra	*Jhongworong*	far-okgnata
Sydney	da-mora	*Murrumbidje*	mur-rugan
Mudje	mara	*Molonglo*	mar-rowla
Wellington	murra	*Head of Bight*	merrer
Liverpool	ta-mura	*Parnkalla*	marra.

All this differs from the Port Essington terms. *Elbow*, however, in the dialects there spoken=*waare* and *forearm=am, ma-woor; wier*, too=*palm*, in Kowrarega.

English.	*Hand*
Terrutong	manawiye
Peel River	ma
Raffles' Bay	maneiya.

English.	*Foot*
Moreton Island	tenang
Peel River	tina
Mudje	dina
Wellington	dinnung
Liverpool	dana
Bathurst	dina
Boraipar	tchin-nang-y
Lake Hindmarsh	jin-nerr
Murrumbidje	tjin-nuk
Molonglo	tjin-y-gy
Pinegorine	gena

English.	*Foot*
Gnurellean	gen-ong-begnen-a
Moreton Bay	chidna
Karaula	tinna
Lake Macquarie	tina
Jhongworong	gnen-ong-gnat-a
Corio	gen-ong-gnet-ok
Colack	ken-ong-gnet-ok
Bight Head	jinna
Parnkalla	idna
Aiawong	dtun
K. George's Sound	tian
Gould Island	pinyun and pinkan.

English.	*Hair, beard*
Moreton Island	yerreng
Bijenelumbo	yirka

English.	*Hair, beard*
Regent's Lake	ooran
Lake Macquarie	wurung
Goold Island	kiaram
Wellington	uran
Karaula	yerry
Sydney	yaren
Peel River	ierai
Mudje	yarai.

English.	*Eye*
Moreton Island	mel
Moreton Bay	mill
Gudang	emeri=eyebrow
Bijenelumbo	merde=eyelid
Regent's Lake	mil
Karaula	mil
Mudje	mir
Corio	mer-gnet-ok
Colack	mer-gnen-ok
Dautgart	mer-gna-nen
Jhongworong	mer-ing-gna-ta
Pinegorine	ma
Gnurellean	mer-e-gnen-a
Boraipar	mer-ring-y
Lake Hindmarsh	mer
Lake Mundy	meer-rang
Murrumbidje	mit
K. George's Sound	mial.

English.	*Tooth*
Moreton Island	tiya
Moreton Bay	deer
Lake Macquarie	tina
Sydney	yera
Wellington	irang
Murrumbidje	yeeran
Gould Island	eera.

English.	*Tongue*
Moreton Bay	dalan
Regent's Lake	talleng
Karaula	talley
Gould Island	talit
Lake Macquarie	talan
Sydney	dalan
Peel River	tale
K. George's Sound	talien.

English.	*Ear*
Kowrarega	kowra
Sydney	kure
Liverpool	kure
Lake Macquarie	ngureong
Moreton Bay	bidna
Karaula	binna
Peel River	bine
Bathurst	benang-arei
Gould Island	pinna.

The main evidence, however, of the fundamental unity of the Australian languages lies in the wide diffusion of identical names for objects like *foot*, *eye*, *tooth*, *fire*, and the like.

CHAPTER LIII.

Van Dieman's Land, or Tasmania.

THE earliest vocabulary we have for Van Dieman's Land is nine words in Cook. Then follows one by La Billardière, then one by Allan Cunningham, collected in 1819, then one by Gaimard taken from the mouth of a Tasmanian woman with an Englishman as an interpreter, at King George's Sound, then one by Mr. Geary, published by Dr. Lhotsky in the transactions of the Geographical Society (vol. ix.); and lastly one, procured by R. Brown, representing nearly the same dialect as that of La Billardière.

The following, however, from the Tasmanian Journal of Natural History, contains more than all put together, and, for practical purposes, all we have. For which reason it is given *in extenso*.

English.	East.	West.	South.	North.	*Uncertain.*
Albatross	——	——	——	tarrina	——
Arm	——	altree	——	——	*gouna houana*
Bad	——	——	carty / peindriga	——	——
Badger	publedina	——	——	——	probaluthin / probylathany
Bandicoot	padina	——	——	lennira	——
Bark	——	——	——	——	toliné
Basket	——	——	——	——	terri
Beach	——	——	minna	——	quenitigna
Beard	——	——	——	——	*canguiné*
Belly	minlean	cawereeny	——	*lomongui* / *tamongui* / *morangui*	mackalenna
Belonging to	——	——	——	——	patourana

English.	East.	West.	South.	North.	*Uncertain.*
Bird	——	——	——	——	*mouta-mouta*
Blackman	——	——	palewaredia	——	——
Blacken	——	——	——	——	langnoïri
Bleed	——	——	kenna teewa	——	——
Blush	wadebeweanna	——	——	——	——
Boat	luirapeny	lallaby	——	——	luiropay
—— (*native*)	——	——	pokak	——	luiropay / picanini
Bone	——	——	Teewandrick	——	——
Boy	plerenny	——	——	——	——

The Tasmanian, with its four dialects, is spoken by fewer than fifty individuals, occupants of Flinders Island, to which they have been removed.

CHAPTER LIV.

Review of the preceding Class.—Its Characteristics, Divisions, and Value.—The so-called Negritos.

THE details of a large group being now done with we may take a retrospect of the class at large.

The first thing which commands attention is its thorough insular or oceanic character; on the strength of which those who choose to give it a general name may call it the *Oceanic* class. Subordinate to this is the remarkable distribution of some of its members; even when treated as Oceanic. Easter Island is nearer to America, Madagascar nearer to Africa than to Asia. Formosa, on the other hand, is in the latitude of China and on the verge of the Japanese waters. The small islands that lie immediately to the North of it end in a compound of *sima*, which, in Japanese, means *island*.

In no one out of the thousand and one islands and islets in which the preceding dialects are spoken, are there any *clear and undoubted* signs of any older population than the speakers of the present languages, dialects and subdialects, in their oldest form. I say *clear and undoubted*, because, in some, they have been either inferred or presumed—it may be on reasonable grounds. The strongest presumptions (not unaccompanied by evidence) in favour of anything of this kind are in Formosa.

In one great division of the group (*i. e.* in Polynesia Proper). the diffusion has been decidedly recent; this

being an inference from the great uniformity with which the language is spoken from the Sandwich Islands to New Zealand, from Easter Island to Ticopia.

That the line of migration for Micronesia and Polynesia was *round* the Papuan area rather than *across* it was suggested by Forster. His suggestion, however, has been but imperfectly recognized, so that some writers have unconsciously re-discovered it, and others have speculated from a point of view which they would never have taken had the investigations of that able man been familiar to them. In blaming others for this neglect the present writer by no means exculpates himself.

Of the difference between the Oceanic tongues and those continental forms of speech which lie nearest to them, in the way of geography, too much has been made. Of the continental languages those which are the most monosyllabic, accentuate, and (to European ears) cacophonic, (such as the Burmese and the Chinese,) are those which are the best known in Europe, while, on the other hand, it is the Malay and the Javanese, with their soft sounds, their dissyllabic and polysyllabic vocables, and their liquid articulations, which have commanded the most attention. In the Manillas and Madagascar a comparatively complex grammar adds to the elements of contrast.

That the difference is considerable cannot be denied. The remark, however, upon the extinction of the nearest congener to the Malay, which was made at the beginning of our exposition, helps to account for it.

Another series of facts that calls for a few remarks lies in the domain of the ethnologist rather than in that of the pure philologue—a series of facts suggested by a term that has been used more than once—viz. *Negrito*. That the Papuans, and that the Australians are of that colour which the name *Negro*, as applied to the African, suggests, is well known. As they are not *yellow*, and as *brown*, *maroon*, *chocolate*, and the like, are by no

means current terms in Geography, we call them somewhat laxly, and somewhat too generally, *Blacks*. And *Black* let them—largely and generally—be called. The main fact connected with their colour lies in the real or supposed existence of men and women of the same dark hue, not only in New Holland and New Guinea, but in certain islands of the Indian Archipelago. In what particular islands they are to be found, and what shade of darkness those that are found actually exhibit, is a matter upon which it is difficult to obtain precise information. Twenty or thirty years ago, these individuals—individuals who may conveniently be called the Blacks of the Malay area—were ascribed to almost every island in the Archipelago with the exception of Java. As the islands, however, have become better known, the Blacks have become conspicuous from their non-existence ; the real fact being that in certain localities certain tribes are, at one and the same time, ruder than the rest, more pagan than the rest, darker-skinned, and (in some cases) worse-fed, than the rest. Of the Blacks of the Philippines (the only group wherein their absolute non-existence has not been demonstrated) this is (in all probability) the most that can be said—in other words, it may safely be stated, that the existence of a variety of mankind forming a class to which the term *Negrito* can either scientifically or conveniently apply is imaginary. How far the same applies to the Samangs of the mainland remains to be seen. Of the Andaman islanders, for the philology of the present group, no cognizance need be taken. *Their* affinities are with the Môn and Burmese.

Now, however unreal this Negrito element in the Indian Archipelago may be, it is clear that, so long as it is assumed, it must serve as a basis for a good deal of hypothetical speculation. In the first place, the languages which go with it run a great chance of being separated from their geographical neighbours on *à priori*

grounds. And on *à priori* grounds this separation has been imagined. After what has been stated, it is needless to add that it has no existence. The Umiray, the San Matheo, and the Dumagat forms of speech are, *eo nomine*, Negrito, and *eá linguá* akin to the Tagala or the ordinary Philippine: as may be seen by either the cursory inspection of them supplied by the present work, or a reference to the fuller vocabulary of Steen Bille's Voyage of the Galathée, from which (the only authority for the class) they are taken.

In respect to the relations borne by the Papuan languages to the Australian, and those borne by the languages of the two groups (taken together) with the Malay and Polynesian (in the ordinary sense of the terms), this same difference of physical conformation (which is to a great extent real) has had a similar effect in engendering guess-work. The statement that, between the Black tongues and the Brown or Yellow there is no affinity, is simply a crudity uttered upon *à priori* grounds by authorities who ought to have been more cautious. There are plenty of affinities. What they are worth is another question. Whatever the Papuan and Australian languages may be like, or unlike, they are more like one another than aught else; they are, also, more like the Malay and Polynesian, however little or great that likeness may be. Whether great or small, however, there is *some* likeness.

And, in like manner, whether the likeness be little or much, the Malay languages are liker to the southern members of the monosyllabic class than to any other forms of speech. Indian affinities they may have, and Turanian affinities they may have, but they have only these so far as they have them through the interjacent tongues, or else through being in either the same, or a similar, stage of development. Common sense suggests this, and observation verifies it.

That the class is a natural one is admitted; the

only doubt being whether it be not too large a one. In other words, it may be a congeries of three or two classes rather than a single group. The present writer, whilst he insists upon its being single, admits that it is a class of a high ordinal value; what that value is being undetermined. It falls into two primary divisions:—

The first contains the *Malay*, the word being used so as to include everything from the Siamese frontier to Formosa on the north and the islands beyond Timor to the east. In this, the Malagasi and Formosan are extreme, or aberrant, divisions: the remainder being grouped round Flores, round Celebes, and round Mindoro, as centres, and the principle of classification being that of type rather than definition. The ordinary way of taking the Malay as a starting-point is inconvenient: inasmuch as, the Malay is an extreme rather than a central form of speech.

The second division of the group begins with Lord North's Island, and ends in the parts between the Kingsmill group and the Samoan Archipelago, containing, *inter alia*, the Ladrones and Carolines, *i. e.* Micronesia. That the Tobi and Pelew languages (the former apparently with special affinities to the Ulea) belong to this rather than to the Philippines is an inference from the few *data* we possess: the Pelew being a very outlying language. That the class ends exactly at the Navigators' Islands is scarcely a safe assertion. That the Kingsmill (or Tarawan) dialects belong to it, and that the Samoan does *not*, is all that is absolutely certain. It may be added that, in other respects, *i. e.* on ethnological grounds, the group is a natural one. It is one, however, for which we are greatly in want of *data*. I know of no grammar for Micronesia; and, although it is nearly certain that more is known in Spain about the Ladrone and Caroline dialects than is current amongst philologues, I know of no written compositions or carefully-constructed vocabularies.

With the Navigators' Islands, or the Samoan Archipelago, the third class, or that containing Polynesia Proper, begins: the Nukahivan being more especially Samoan, and the Hawaian of the Sandwich Islands being more particularly Nukahivan. Then come the Society and Friendly Islands, forming the central mass, from which Paumoto (Dangerous Archipelago), Easter Island, Rarotonga, the Austral Islands, and New Zealand—each in their several directions—seem to have been peopled; with Ticopia, Rotuma, Uea, &c., as offsets in the West. The minute detail of all this has been carefully investigated by able philologues, missionary and lay; indeed the amount of material collected for Polynesia Proper stands in a favourable contrast to the scantiness of our *data* for Micronesia.

The ordinal value of the Polynesian class is as low as that of the Turk; and, if we allow for the difference between a wide diffusion over a continent and a wide diffusion over an ocean, it is with the Turks that the Polynesians must be compared. They have spread both recently and rapidly. In the Micronesian and Malay groups there must be some five or six sections, each of which is of as high an ordinal value as all Polynesia. On the other hand, it is possible that the oldest island beyond the Samoan Archipelago has received its population from the Navigators' Islands subsequent to the date of the settlement of the Norwegians in Iceland.

The second grand class may be called *Kelenonesian*, (a term which is preferable on etymological grounds to *Melanesian*,) or the class appertaining to the islands with a dark-skinned population. Of this enough has been said already. It falls into two or three primary divisions as the case may be—certainly into the Papuan and Australian, perhaps into the Papuan, the Australian, and the Tasmanian.

The Polynesians went *round* Kelenonesia; and, according to many good authorities, the Fijis give us an

area where the two streams met. Individually, I think that the Papuan element in their dialects has been over-valued. I commit myself, however, to no decided opinion. The Fiji group was, therefore, dealt with by itself, and the chief Papuan affinities (taken wholly from Gabelentz) which its vocabularies exhibited were given somewhat fully.

Each of the Kelenonesian groups (even if we take in the Tasmanian as a primary one) is of high ordinal value, especially when it is compared, or contrasted, with the Polynesian Proper, to which it stands much in the same relation as the Ugrian does to the Turk, Mongol, or Tungús. This is an inference not only from certain extreme forms but from the decided contrasts which certain languages of islands in close geographical relations to each other present. That certain phenomena of transition will occur when the forms of speech from the central parts of New Guinea become known is what may reasonably be expected. Still, the extremes will remain as distant from one another as before; and so will the chasms in the interjacent area. As it is, the New Guinea languages appear to constitute a group equivalent to all the rest put together; beyond which the Soloman Islands, the New Hebrides, the Loyalty Islands, and New Caledonia, form three subordinate divisions of a second class, themselves falling into sections and sub-sections. With *data*, however, so scanty as those which we possess, no arrangements can be other than provisional; so that it is only on the principle that truth comes more easily out of error than out of confusion that the previous classification has been suggested.

That the grammatical structure of the Papuan languages has been credited with certain remarkable characteristics—characteristics of sufficient importance to be set against a considerable amount of glossarial coincidence—has already been stated. I think, however, that much of their value depends upon their novelty.

Gabelentz, with whom any investigator must differ with hesitation, lays manifest stress upon two points—the quinary character of the Papuan numeration and the system of personal pronouns. But the former is a negative, rather than a positive, character—all the more so from the fact of the five numerals as far as they go, being undeniably and admittedly both Malay and Polynesian.

With the personal pronouns the matter is less simple. They present two phenomena; (1) the so-called Exclusive and Inclusive forms, and (2) the so-called Trinal number.

Of these the Annatom gives a fair example; where

Ainyak = *I*	Aijumtaij = *you three* − *I*
Akaijan = *you two* + *I*	Akaija = *you* + *I*
Ajumrau = *you two* − *I*	Aijama = *you* − *I*.
Akataij = *you three* + *I*	

That these are rare ways of speaking cannot be denied. Few persons in English care to say how many persons they address, or yet to say whether they are themselves included in what is said. What, however, are such expressions as *nos otros*, *vos otros*, in Spanish, and *nui altri*, *vui altri* in Sardinian, but plurals, which (whatever they may be at the present time) are *exclusive* in their origin? It can scarcely, however, be said that these are inflections.

And the same applies to the so-called trinal number. Who calls *we three*, in English, a Number at all, *i. e.* a Number in the technical and grammatical sense of the word? Who even calls *us two* a Dual? Yet that the Papuan Trinal is neither more nor less than this is plain from the following forms in the Mallicollo: —

Inau = *I*	Kha-mühl = *you two*
Khai-im = *you*	Na-taroi = *you three*
Na-ii = *he*	Na-tavatz = *you four*
Na-mühl, Drivan = *we two* (*exclusive*, *inclusive*)	Dra-tin = *we three*
	Dra-tovatz = *we four*.

As points, then, of grammar, or, at any rate, as points of *inflection*, I submit that the Quinary Numeration, the Exclusive and Inclusive Pronouns, and the Trinal Number be eliminated from the consideration of the Papuan characteristics; and I add that, even if they were grammatical they would scarcely be characteristic; inasmuch as they may be found elsewhere, and that not only sporadically, or among the languages of the world at large, but within the Malay and Polynesian area itself.

Other points of criticism connect themselves with the *phonesis*. The Polynesian languages are pre-eminently vocalic. They are vocalic if we look to the paucity of separate consonantal sounds; *b*, *d*, *g*, *s*, and *r*, being generally wanting. They are vocalic if we look to the fact of few or no words ending in a consonant. They are vocalic if we look to the non-existence of two concurrent consonants in the same syllable.

Now, in all these matters the Papuan tongues present *some* contrast. In some of the islands there are consonantal endings; in some concurrent consonants; in all of them more elementary consonants than are to be found in any language of Polynesia. Yet they differ among themselves in the extent to which they are thus consonantal; some having many, others but few, words, where a consonant is final. *None* are more vocalic than the most vocalic of the Malay tongues; and among the Malay tongues themselves some are more consonantal than others. Above all, it is not with the Polynesian that the Papuan tongues are, in the first instance, to be compared—still less exclusively.

As has already been stated, the ordinal value of the Polynesian class is *nil*, or nearly so. The real point of contact between the Papuan and Non-papuan tongues lies in the parts about Ceram. From these I think that New Guinea was peopled at a period anterior to the peopling of Micronesia; at a time when the remote

ancestors of the Eastern Moluccas were ruder, more undersized, and darker-skinned (for in this sense the term Negrito may have an ethnological import), than they are now; at a time when they were chiefly pagan; at a time when the useful arts were in their very rudiments; at a time when the numeration went no further than the five fingers of a single hand. If so, the Polynesians should give us the extremities of two chains, rather than any link between them.

The relations of the Papuans to the Australians is more equivocal. I once suggested, on the strength of certain New Caledonian affinities, that Tasmania was peopled by means of a migration that came *viâ* the Papuan islands, *i. e. round* Australia, rather than *across* it; a doctrine which at present I am prepared neither to abandon nor assert.

In like manner Australia may have been peopled from New Guinea, or from Timor: if from Timor, at a period of greater rudeness and barbarity than even that which (by hypothesis) prevailed in the Eastern Moluccas when New Guinea was first occupied. When Australia was first trod numeration had not even reached *five*.

The numerals are preceded by prefixes (as may be seen in the specimen) throughout the Papuan languages; and in comparatively distant localities these prefixes coincide—*e. g.* in the Louisiade and New Caledonia.

English	*One*	*Two*
Brierly Island	*paihe*-tia	*pahi*-wo
Cook's New Caledonia	*wa*-geeaing	*wa*-roo
La Billardière's do.	*oua*-nait	*oua*-dou
English	*Three*	*Four*
Brierly Island	*paihe*-tuan	*paihe*-pak
Cook's New Caledonia	*wa*-teen	*wa*-mbaeek
La Billardière's do.	*oua*-tguien	*oua*-tbait
English	*Five*	*Six*
Brierly Island	*paihe*-lima	*paihe*-won
Cook's New Caledonia	*wa*-nnim	*wa*-nnim-geeek
La Billardière's do.	*oua*-nnaim	*ou*-naim-guik

English	*Seven*	*Eight*
Brierly Island	*pahe*-pik	*paihe*-wan
Cook's New Caledonia	*wa*-nnim-noo	*wa*-nnim-gain
La Billardière's do.	*oua*-naim-dou	*ou*-naim-guein
English	*Nine*	*Ten*
Brierly Island	*paihe*-siwo	*paihe*-awata
Cook's New Caledonia	*wa*-nnim-baeek	*wa*-nnoon-aiuk
La Billardière's do.	*oua*-naim-bait	*oua*-doun-hic.

Traces of this, however, may be found within the Malay area.

Another point worth noticing is the following; a point best illustrated by certain American languages, *e. g.* amongst others by those of the following table :—

(1.)

English.	Mbaya.	Abiponian.	Mokobi.
Head	*na*-guilo	*ne*-maiat	——
Eye	*ni*-gecoge	*na*-toele	*ni*-cote
Ear	*na*-pagate	——	——
Nose	*ni*-onige	——	——
Tongue	*no*-gueligi	——	——
Hair	*na*-modi	*ne*-etiguic	*na*-ccuta
Hand	*ni*-baagadi	*na*-pakeni	*na*-poguena
Foot	*no*-gonagi	——	——

(2.)

English.	Moxa (1).*	Moxa (2).	Moxa (3).
Head	*nu*-ciuti	*nu*-chuti	*nu*-chiuti
Eye	*nu*-chi	——	*nu*-ki
Ear	*nu*-cioca	——	——
Nose	*nu*-siri	*nu*-siri	——
Tongue	*nu*-nene	*nu*-nene	*nu*-nene
Hand	*nu*-bore	*nu*-boupe	*nu*-bore
Foot	*ni*-bope	——	*ni*-bope.

Here the prefix is the possessive pronoun, so that *na-guilo = my head*, &c.; the capacity of the speaker for separating the thing possessed from the possessor being, apparently, so small as to make it almost impossible to disconnect the noun from its pronoun.

The Papuan and (?) Tasmanian give the same amalgamation.

* These are three different dialects.

Upon what may be called the Ablative Subject, more will be said in the sequel.

What follows is an extract from three very short vocabularies, illustrating the statement, made some chapters back, that the *Ombay*, the *Mangarei*, and the *Timbora*, had Kelenonesian affinities.

Arm=*ibarana*, Ombay; *porene*, Pine Gorine dialect of Australia.
Hand=*ouiue*, Ombay; *hingue*, New Caledonia.
Nose=*imouni*, Ombay; *maninya*, *mandeg*, *mandeinne*, New Caledonia; *mena*, Van Dieman's Land, western dialect; *mini*, Mangerei; *meoun*, *muidge*, *mugui*, Macquarie Harbour.
Head=*imocila*, Ombay; *moos* (=hair), Darnley Islands; *moochi* (=hair), Massied; *immoos* (=beard), Darnley Islands; *eeta moochi* (=beard), Massied.
Knee=*icici-bouka*, Ombay; *bowka*, *boulkay* (=forefinger), Darnley Islands.
Leg=*iraka*, Ombay; *horag-nata*, Jhongworong dialect of the Australian.
Bosom=*ami*, Ombay; *naem*, Darnley Island.
Thigh=*itena*, Ombay; *tinna-mook* (=foot), Witouro dialect of Australian. The root, *tin*, is very general throughout Australia in the sense of *foot*.
Belly=*te-kap-ana*, Ombay; *coopoi* (=navel), Darnley Island.
Stars=*ipi-berre*, Mangarei; *bering*, *birrong*, Sydney.
Hand=*tanaraga*, Mangarei; *taintu*, Timbora; *tamira*, Sydney.
Head=*jahé*, Mangarei; *chow*, King George's Sound.
Stars=*kingkong*, Timboro; *chindy*, King George's Sound, Australia.
Moon=*mang'ong*, Timbora; *meuc*, King George's Sound.
Sun=*ingkong*, Timbora; *coing*, Sydney.
Blood=*kero*, Timbora; *gnoorong*, Cowagary dialect of Australia.
Head=*kokore*, Timbora; *gogorrah*, Cowagary.
Fish=*appi*, Mangarei; *wapi*, Darnley Island.

Of these affinities nearly all are Australian. In those with the Papuan dialects the parts about Ceram and Gilolo are the most abundant.

CHAPTER LV.

Languages of America. — The Eskimo. — The Athabaskan dialects. — The Kitunaha. — The Atna. — The Haidah, Chemmesyan, Wakash, and Chinuk.

THE languages of the New World now come under notice; languages of which the origin some few years back was obscure. This was because most of our *data* for the ethnology of America were derived from the Indians of Canada and the United States rather than from those of the Hudson's Bay Territory and Russian America. As long as the parts between the Rocky Mountains and the Pacific were insufficiently explored, the nearest congeners to the populations of the north-eastern parts of Asia were insufficiently known. With the improvements in this respect the mystery has diminished—so much so that, even before we leave Asia, decided affinities between the languages of Siberia and the languages of the northern coast of the Pacific present themselves.

The lines by which America might be peopled from Asia are three—the first, *viâ* Behring's Straits; the second, *viâ* the Aleutian chain of islands—islands running from Kamtshatka to the Peninsula of Aliaska; the third, *viâ* the Kurile islands, from either Korea or the Peninsula of Sagalin. Of these, though the presumptions may be in favour of the first, the phenomena in the present state of our knowledge, favour the second.

For Europe and Asia the Circumpolar forms of speech

belong to different genera, if not to different orders; and they are comparatively numerous. Above all, they have (every one of them) decided southern affinities—so much so as to give them the appearance of being intrusive. With the Norwegian and Russian this is not only the case, but it is known to be so. Of the Lap and Samoyed the southern origin is less decided. On each side, however, there are southern affinities. With the Tungús these southern affinities are more decided still. The nearest approach (after the Lap) to anything like an original Arctic *situs* is supplied by the Yukahiri and Tshuktshi. Yet even here it is only an approach.

In America, on the other hand, the Arctic region is mainly covered by dialects of a single language—the Eskimo; the intrusion from the south being inconsiderable. Hence, the Eskimo area is horizontal rather than vertical; broad rather than deep; and running, in its extension, from east to west rather than from north to south. The language of Greenland and Labrador is Eskimo. The language of the eastern extremity of Asia is Eskimo. The language of the Aleutian islands is Eskimo. The language of the interjacent regions is Eskimo also.

So much for the breadth and continuity of the Eskimo area.

In respect to its depth, it has its *maximum* on the Atlantic, where it reaches the latitude of Newfoundland.

It is on the side of the Atlantic* that the contrast between the Eskimo and the ordinary Indian of North America—the *Red* Indian as he is often called—is most

* It is often useful (not to say necessary) to speak thus; indeed, we must occasionally write *Atlantic* and *Pacific* instead of *West* and *East*. This is because we have occasionally to shift our position. The Eskimos of Greenland are an Eastern, and the Konægi of Kadiak a Western, population, only, when we look at them from Europe. When we begin with the Namollos of the Asiatic side of Behring's Straits, and go on with the Aleutians, and the Konægi, East becomes West, and *vice versâ*.

decided. Hence, as long as the phenomena of transition which are exhibited on the side of the Pacific were unknown, the connection between the aborigines with both the Siberians and the Americans was not only doubtful, but the line of demarcation which was drawn between the Eskimo and the Indian was exaggerated.

The Eskimo is the only language common to the two continents; and this it is in two ways. The Aleutian dialects are in *situ*, and, as such, actually transitional. But, besides these, there is, in the parts about the Anadyr and Tshuktshi Noss, a population of comparatively recent origin, occupant of the parts between the most western of the true Tshuktshi of Behring's Straits—a population which seems (so to say) to have been reflected back from America upon Asia. On the other hand, however, no true Asiatic language is spoken in any part of America.

The best known of the *Aleutian* forms of speech, which probably represent a group of the ordinal value of all the others put together, is the *Unalashkan*.

Next to the Eskimo comes the great *Athabaskan* family, stock, group, or class.

The Athabaskan area touches Hudson's Bay on the one side, the Pacific on the other.

With the exception of the Eskimo, the Athabaskan forms of speech are the most northern of the New World.

For the northern Athabaskans (the main body of the family) the philological details were, until lately, eminently scanty and insufficient. There was, indeed, an imperfect substitute for them in the statements of several highly trustworthy authors as to certain tribes which spoke a language allied to the Chepewyan and as to others who did not;—statements which, on the whole, have been shown to be correct; statements, however, which required the confirmation of vocabularies. These have now been procured; if not to the full extent of all the details of the family to an extent quite sufficient for the purposes of the philologue. They show that the most western branch of the stock, the Chepewyan Proper, or the language of what Dobbs called the Northern Indians, is closely akin to that of the Dog-ribs, the Hare (or Slave), and the Beaver Indians, and that the Dahodinni, called from their warlike habits the Mauvais Monde, are but slightly separated from them. Farther west a change takes place, but not one of much importance. Interpreters are understood with greater difficulty, but still understood.

The Takulli, Nagail, or Chin division falls into no less than eleven minor sections; all of which but one end in this root, viz. *-tin.*

1. The Tau-*tin*, or Talko-*tin.*

(?) 2. The Tsilko-*tin* or Chilko-*tin*, perhaps the same word in a different dialect.

3. The Nasko-*tin*
4. The Thetlio-*tin*
5. The Tsatsno-*tin*
6. The Nulaau-*tin.*
7. The Ntaauo-*tin.*
8. The Natliau-*tin.*
9. The Nikozliau-*tin.*
10. The Tatshiau-*tin*, and
11. The Babin Indians.

Sir John Richardson has shown, what was before but suspected, that the Loucheux Indians of Mackenzie River are Athabaskan; the Loucheux being a tribe known under many names—under that of the Quarrellers, under that of the Squinters, under that of the Thycothi and Digothi, under that of Kutshin. The particular tribes of the Kutshin division, occupants of either the eastern frontier of Russian America, or the north-western parts of the Hudson's Bay territory, are as follows:—

1. The Artez-*kutshi* = Hard people.
2. The Tshu-*kutshi* = Water people.
3. The Tatzei-*kutshi* = Rampart people; falling into four bands.
4. The Teystse-*kutshi* = People of the shelter.
5. The Vanta-*kutshi* = People of the lakes.
6. The Neyetse-*kutshi* = People of the open country.
7. The Tlagga-silla = Little dogs.

This brings us to the *Kenay*. A Kenay vocabulary has long been known. It appears in Lisianisky, tabulated with the Kadiak, Sitkan, and Unalaskan of the Aleutian Islands. It was supplied by the occupants of Cook's Inlet. Were these Athabaskan? The present writer owes to Mr. Isbister the suggestion that they were Loucheux, and to the same authority he was indebted for the use of a very short Loucheux vocabulary. Having compared this with Lisiansky's, he placed both languages in the same category—rightly in respect to the main point, wrongly in respect to a subordinate. He determined the place of the *Loucheux* by that of the Kenay, and made both Kolush. He would now reverse the process and make both Athabaskan (in the widest sense of the word), as Sir John Richardson has also suggested.

For all the languages hitherto mentioned we have specimens. For some, however, of the populations whose names appear in the maps, within the Athabaskan

area, we must either rest satisfied with the testimony of writers or rely on inference. In some cases, too, we have the same population under different names. Without, then, giving any minute criticism, I will briefly state that all the Indians of the Athabaskan area whose names end in *-dinni* are Athabaskan; viz.—

1. The See-issaw-*dinni* = Rising-sun-*men*.
2. The-tsawot-*dinni* = Birch-rind-*men*.
3. The Thlingeha-*dinni* = Dog-rib-*men*.
4. The Etsh-tawút-*dinni* = Thickwood-*men*.
5. The Ambah-tawút-*dinni* = Mountain-sheep-*men*.
6. The Tsillaw-awdút-*dinni* = Bushwood-*men*.

Hare-Indians and *Strong-bows* are also Athabaskan names. The *Hare*-Indians are called *Kancho*. The *Nehanni* and some other populations of less importance are also, to almost a certainty, Athabaskan.

The *Atna* at the mouth of the Copper River, the *Koltshani* higher up the stream, and the *Ugalents* around Mount St. Elias, are all Athabaskan—not, indeed, so decidedly as the Beaver, the Dog-rib, or the Proper Chepewyan; but still Athabaskan. They are not Eskimo though they have Eskimo affinities. They are not Kolush, though they have Kolush affinities. They are by no means isolated, and as little are they to be made into a class by themselves. At the same time, it should be added that by including these *we raise the value of the class*, and we raise it still more when we include the Kolush.

The Athabaskan is broadly and definitely separated from the language of its frontiers in proportion as we move from the Pacific towards the Atlantic.

The most southern of the Athabaskans Proper are the Sussis, in north latitude 51°—there or thereabouts. But they are only the most Southern of the Athabaskans *en masse*. There are *outlyers* of the stock as far south as the southern parts of Oregon. More than this, there are Athabaskans in California, New Mexico, and Sonora.

Mr. Hale showed that the Umkwa, Kwaliokwa, and Tlatskanai dialects of a district so far south as the mouth of the Columbia, and the upper portion of the Umkwa, were outlying members of the Athabaskan stock, which dialects were afterwards shown, by a discovery of Professor Turner's, to be only *pen*ultimate ramifications; inasmuch as in California, New Mexico, Sonora, and even in Chihuhua, as far south as 30° north latitude, Athabaskan forms of speech were to be found; viz. the Navaho, the Jecorilla, the Pinalero, along with the Apatsh of New Mexico, California, and Sonora. To these add the Hoopah of California, which is also Athabaskan.

The *Kitunaha, Kutani, Cootanie* or *Flatbow* area is long rather than broad, and it follows the line of the Rocky Mountains between 52° and 48° north latitude. How definitely it is divided by the main ridge from that of the Blackfoots I am unable to say; but as a general rule, the Kutani lie west, the Blackfoots east; the former being Indians of New Caledonia and Oregon, the latter of the Hudson's Bay Territory.

On the west, the Kutani country is bounded by that of the Shuswap and Selish; on the north by the Sussí, Sikanni, and Nagail Athabaskans; on the south (I

think) by some of the Upsaroka or Crow tribes. All these relations are remarkable, and so is the geographical position of the area. It is in a mountain range; and, as such, it is a district likely to be an ancient occupancy. The languages of the frontiers are referable to four different families—the Athabaskan, the Atna, the Algonkin, and the Sioux; from all of which the Kutani differs notably; though, like all the languages of America, it has numerous miscellaneous affinities. In respect to its phonesis it agrees with the North Oregon languages. The similarity in name to that of the Loucheux, whom Richardson calls *Kutshin*, deserves notice.

The Kútani vocabulary of Mr. Hale was obtained from a Cree Indian, and is not to be depended on. This being the case it is fortunate that it is not the only specimen of the language. There is an earlier one of Mr. Howse's, published in the Transactions of the Philological Society. It is as follows; being given in full as representing all that is known of the language:—

West of the Kutanis and south of the Takulli Athabaskans lie the northernmost members of a great class, which extends as far south as the Sahaptin frontier. It has been named by Hale and Gallatin *Tsihaili-Selish.* It contains the Shushwap or Atna Proper, Kuttelspelm (or Pend d'Oreilles), Selish, Spokan (or Kettle Fall), Okanagan, Skitsuish (or Cœur d'Alène), Piskwaus, Nusdalum, Kawitchen, Cathlascou, Skwali, Chechili, (Tsihaili,) Kwaintl, Kwenaiwtl, (Kowelitsk,) Nsietshawus (or Kïllamuk), and Billechula, spoken at the mouth of Salmon River; a language to which a vocabulary from Mackenzie's Travels of the dialect spoken at Friendly Village is referable.

The Tsihaili-Selish languages reach the sea in the parts opposite Vancouver's Island. Perhaps they touch it to the north also. Perhaps, too, some of the Takulli forms of speech still further north do the same. The current statements, however, are to the effect that to the south of the parts opposite Sitka and to the north of the parts opposite Vancouver's Island the two families in question are separated from the Pacific by a narrow strip of separate languages. These are, beginning from the north—

1. The *Kolush.*

2. The *Haidah,* spoken by the Skittegats, Massets, Kumshahas, and Kyganie of Queen Charlotte's Islands and the Prince of Wales' Archipelago.

3. The *Chemmesyan,* spoken along the sea-coast and islands in north latitude 55°;

4. The *Hailtsa,* containing the dialects of the sea-coast between Hawkesbury Island and Broughton's Archipelago; also those of the northern part of Vancouver's Island.

From the Piskwaus, in the preceding group, the transition, in the opinion of the present writer, who only attempts a provisional and approximate arrangement, lies through the Billechula (which he makes Atna) to the Hailtsa and its congeners of the present group.

The class to which the Nútka and its congeners belong is called the *Wakash*. The Tlaoquatsh and Wakash Proper belong to it.

CHAPTER LVI.

Languages of Oregon and California.—Cayús, &c.—Lutuami, &c.—Ehnek.—Weitspek.—Kulanapo.—Copeh.—Pujuni, &c.—Costano, &c.—Eslen.—Netela.—San Diego, &c.

ALL the preceding languages belong to the Hudson's Bay Territory and to British Oregon rather than to California. Those that follow belong to California and American Oregon. Though the minute details of the frontier are not accurately known there seems to be a notable change in the parts about it. The nature of this, in a rough way, may be illustrated by the following table.

Contrast the two columns. How smoothly the words on the right run, how harshly sound (when they can be sounded) those of the left. Not, however, that they give us the actual sounds of the combination *khl*, &c. All that this means is that there is some extraordinary sound to be expressed which neither any existing sign nor any common combination will represent. In Mr. Hale's vocabularies it is represented by a special letter.

English.	Selish.	Tshinúk.	Shoshoni.
Man	skaltamekho	tkhlekala	taka
Woman	s*u*maăm	tkhlākél	kw*uu*
Boy	skokosea	tklkask*u*s	natsi
Girl	shaut*u*m	tklalekh	naints*u*ts
Child	akt*u*lt	etshanúks	wa
Father	l*u*áus	tkhliamáma	ápui
Mother	skúis	tkhlianáa	pia
Wife	makhonakh	iuakhékal	wépui
Son	skokosea	etsokha	natsi
Daughter	st*u*mtshäălt	okw*u*kha	nanai
Brother	katshki (elder)	kapkhu	tamye
Sister	tklkikee	tkhliau	namei.

As a general rule the harsher phonesis lies to the north, the softer to the south, of the Californian frontier. That the difference, however, is, by no means, absolute, may be seen from the following list :—

(1.)

English.	Wishosk.	Weiyot.
Boy	ligeritl	kushama
Married	wehowut'l	haqueh
Head	wutwetl	metwet
Hair	pah'tl	paht'l
Face	kahtsouetl	sulatek
Beard	tseh'pl	cheh'pl
Body	tah	hit'l
Foot	wehlihl	wellih'tl
Village	mohl	katswah'tl
Chief	kowquéh'tl	kaiowuh
Axe	mahtl	mehtl
Pipe	maht'letl	mahtlel
Wind	rahtegut'l	ruktagun
Duck	hahalitl	hahahlih.

(2.)

English.	Dieguno.	Cuchan.
Leg	cwith'l	——
To-day	enyat'l	——
To-morrow	matinyat'l	——
Bread	meyut'l	——
Ear	hamat'l	smyth'l
Neck	——	n'yeth'l
Arm / *Hand*	selh	iseth'l
Friend	——	nyet'l
Feather	——	sahwith'l.

And the mixture may be seen on the frontier. The Tshinúk, a harsh tongue, has for its nearest congeners the Killamuk on one side and the Lutuami (apparently soft) on the other.

The *Cayús*, or *Molele*, group is, apparently, transitional.

English.	Cayús.	Willamet.

The *Lutuami*, *Shasti*, and *Palaik* are thrown by Gallatin into three separate classes. They are, without doubt, mutually unintelligible. Nevertheless they cannot be very widely separated.

The chief language in contact with the Shasti is the intrusive Athabaskan of the Umkwa and Tlatskanai tribes. Hence the nearest languages with which it should be compared are the Jakon and Kalapuya, from which it is geographically separated. For this reason we do not expect any great amount of coincidences. We find some, however.

Neither are there wanting affinities to the *Sahaptin* and *Cayús* languages—allied to each other. Thus—

Ear=*mumutsh* Lutuami=*ku-mumuats* Palaik=*mutsaui* Sahaptin=*tsak* Shasti=*taksh* Cayús.
Mouth=*shum* Lutuami=*shum-kaksh* Cayús=*him* Sahaptin.
Tongue=*pawus* Lutuami=*pawish* Sahaptin=*push* Cayús.
Tooth=*tut* Lutuami=*til* Sahaptin.
Foot=*akwes* Shasti=*akhua* Sahaptin.
Blood=*ahati* Palaik=*kiket* Sahaptin.
Fire=*loloks* Lutuami=*ihiksha* Sahaptin.
One=*natshik* Lutuami=*naks* Sahaptin=*na* Cayús.
Two=*lapt* Lutuami=*lapit* Sahaptin=*n* Cayús.

The Lutuami seems somewhat the most Sahaptin of the three; and this is what we expect from its geographical position. It is also, like the Palaik, conterminous with the Wihinast; both Palaik and Lutuami, along with the Shasti, having Shoshoni (for which see the sequel) affinities.

English.	Shoshoni.
Nose	moui=iami, *Palaik.*
Mouth	timpa=shum, *Lutuami.*
Ear	inana=isak, *Shasti.*
Sun	tava=sapas, *Lutuami.*
Water	pa=ampo, *Lutuami.*
I	ni=no, *Lutuami.*
Thou	i=i, *Lutuami.*
He	oo=hot, *Lutuami.*
One	shimutsi=*tshiamuu*, Shasti; *umis*, Palaik.

The latter of the following vocabularies, which, with those that follow, belong to California, was taken from a *Seragoin* Indian, *i. e.* from an Indian to whom it was *not* the native tongue. We are warned of this by the collector—the inference being that the *Tahlewah* vocabulary is not wholly trustworthy.

English.	Ehnek.	Tahlewah.
Man	ahwunsh	pohlusan'h
Boy	anak'hocha	kerrhn
Girl	yehnipahoitch	kerníhl
Indian	ahrah	astowah
Head	akhoutshhoutsh	astinthah

Foot	fissi	stah
One	issah	titskoh
Two	achhok	kitchnik
Three	keurakh	kltchnah
Four	peehs	tshahanik
Five	tirahho	schwallah
Ten	trah	swellah.

The junction of the Rivers Klamatl and Trinity gives us the locality for the *Weitspek.* Its dialects, the *Weiyot* and *Wishosk,* extend far into Humboldt County, where they are, probably, the prevailing forms of speech, being used on the Mad River, and the parts about Cape Mendocino. From the Weitspek they differ much more than they do from each other.

English.	Weitspek.	English.	Weitspek.
Man	pagehk	*Moon*	ketnewahr
Woman	wintsuk	*Star*	haugets
Boy	hohksh	*Day*	tehnep
Girl	wai inuksh	*Dark*	ketutski
Head	tegueh	*Fire*	mets

Foot	metské	*Eight*	k'hehwuh
Blood	happ'l	*Nine*	kerr
Sun	wánoushleh	*Ten*	wert'hlehwerh.

Mendocino is the name suggested for the *Choweshak, Batemdaikai, Kulanapo, Yukai,* and *Khwaklamayu* forms of speech collectively.

1, 2. The *Choweshak* and *Batemdaikai* are spoken

on Eel River, and in the direction of the southern branches of the Weitspek group, with which they have affinities.

3, 4, 5. The *Kulanapo* is spoken about Clear Lake, the *Yukai* on Russian River. These forms of speech, closely allied to each other, are also allied to the so-called *Northern* Indians of Baër's *Beiträge*, &c.—*Northern* meaning to the north of the settlement of Ross. The particular tribe, of which we have a vocabulary, called itself *Khwakhlamayu.*

(1.)

Sun	lah	*Ten*	hadorutlek.

The *Copeh* is spoken at the head of Putos Creek. How far this will eventually turn out to be a convenient name for the group, or how far the group itself will be natural, is uncertain. A vocabulary in Gallatin from the Upper Sacramento, and one from Mag Readings, in the south of Shasti county, belong to the group.

English.	Copeh.	Mag Readings.	Upper Sacramento.

Hale's vocabulary of the *Talatui* belongs to the group for which the name *Moquelumne* is proposed; a Moquelumne Hill and a Moquelumne River being found within the area over which the languages belonging to it are spoken. Again, the names of the tribes that speak them end largely in *-mne,—Chupumne*, &c. As far south as Tuol-*umne* county the language belongs to this division; viz. (1.) the Mumaltachi; (2.) the Mullateco; (3.) the Apangasi; (4.) the Lapappu; and (5.) the Siyante or Typoxi bands speak this language.

(1.)

English.	Talatui.	San Raphael.

The tribes under the supervision of the Mission of Dolores were five in number; the Ahwastes, the Olhones, or *Costanos* (of the *coast*), the Romonans, the Tulomos, and the Altatmos. The vocabulary of which the following is an extract was taken from Pedro Alcantara, who was a boy when the Mission was founded, A.D. 1776. He was of the Romonan tribe.

English.	Costano.	English.	Costano.
Man	imhen	*Ear*	tuorus
Woman	ratichma	*Eye*	rehin
Boy	shínísmuk	*Nose*	ús
Girl	katra	*Mouth*	werper
Head	úlc	*Tongue*	tassek

Sun	nyatz	*Ten*	arapa.

The *Cocomaricopa* Indians are joint occupants of certain villages on the Gila; the population with which they are associated being Pima. Alike in other respects, the Pima and Cocomaricopa Indians differ in language.

CHAPTER LVII.

Old California.

San Diego lies in 32½° north latitude, a point at which the philology diverges. I first follow it in the direction of Old California. It is stated in the *Mithridates* that the most northern of the Proper *Old* Californian tongues, the *Cochimi*, is spoken as far north as 33°. If so, the Dieguno may be *Old* Californian as well as *New;* which I think it is, believing, at the same time, that *Cochimi* and *Cuchan* are the same words.

Again, in the following Paternoster the word for *sky* =*ammi* in the Cuchan vocabulary.

Cochimi of San Xavier.

father *sky*
Pennayu makenambà yaa *ambayujui* miyà mo;
name *men* *confess* *and* *love* *all*
Buhu mombojua tamma gkomendà hi nogodoño demuejueg gkajim;
and *sky* *earth* *favour*
Pennayùla bogodoño gkajim, gui hi ambayujup maba yaa keammete decuiny: mo puegiñ;
sky *earth*
Yaa m blihula mujua ambayup mo dedahijua, amet ê nò guìlugui ei pag-kajim;
this *day* *day*
Tamadà yaa ibo ejueg quiluguiqui pemijich ê mòu ibo yanno puegiñ;
and *man* *evil*
Guihi tamma yaa gambuegjula kepujui ambinyijua pennayala dedaudugùjua, giulugui pagkajim;
and *although* *and*
Guihi yaa tagamuegla hui ambinyijua hi doomo puhuegjua, he doomo pogonunyim;

and *earth* *bless* *evil*
Tagamuegjua guihi usimahel keammet è decuinyimo, guihi yaa hui ambinyi yaa gambuegpea pagkaudugum.

Of recent notices of any of the languages of Old California, *eo nomine*, I know none. In the *Mithridates* the information is pre-eminently scanty.

According to the only work which I have examined at first hand, the *Nachrichten von der Americanischen Halbinsel Kalifornien* (Mannheim, 1772; in the *Mithridates*, 1773), the anonymous author of which was a Jesuit missionary in the middle parts of the peninsula, the languages of Old California were—

1. The *Waikur*, spoken in several dialects.
2. The *Utshiti*.
3. The *Layamon*.
4. The *Cochimi*, north, and
5. The *Pericu*, at the southern extremity of the peninsula.
6. A probably new form of speech used by some tribes visited by Linck.

This is what we learn from what we may call the Mannheim account; the way in which the author expresses himself being not exactly in the form just exhibited, but to the effect that, besides the Waikur with its dialects, there were five others.

The Waikur Proper, the language which the author under notice was most especially engaged on, and which he says that he knew sufficiently for his purposes as a missionary, is the language of the middle part of the peninsula. How far the Utshiti and Layamon were dialects of it, how far they were separate substantive languages, is not very clearly expressed. The writer had Utshis, and Utshipujes, and Atschimes in his mission, "thoroughly distinct tribes—*lauter verschiedene Völcklein.*" Nevertheless he always speaks as if the Waikur tongue was sufficient for his purposes. On the other hand, the Utshiti is especially mentioned as a separate

language. Adelung makes it a form of the Waikur; as he does the Layamon, and also the Cora and Aripe. Then there comes a population called *Ika*, probably the Picos or Ficós of Bagert, another authority for these parts. Are these, the sixth population of the Mannheim account, the unknown tribes visited by Linck? I think not. They are mentioned in another part of the book as *known*.

To the names already mentioned—

1. Ika,
2. Utshi,
3. Utshipuje,
4. Atschime,

add

5. Paurus,
6. Teakwas,
7. Teengúabebes,
8. Angukwaros,
9. Mitsheriku-tamais,
10. Mitsheriku-tearus,
11. Mitsheriku-ruanajeres,

and you have a list of the tribes with which a missionary for those parts of California where the Waikur language prevailed, came in contact. Altogether they gave no more than some 500 individuals, so miserably scanty was the population.

The occupancies of these lay chiefly within the Cochimi area, which reached as far south as the parts about Loretto in 26° north latitude; the Loretto language being the Layamon. This at least is the inference from the very short table of the *Mithridates*, which, however little it may tell us in other respects, at least informs us that the San Xavier, San Borgia, and Loretto forms of speech were nearer akin to each other than to the Waikur.

English.	San Xavier.	San Borgia.	Loretto.	Waikur.
Sky	ambayujub	ambeink	——	terereka-datemba
Earth	amet	amate-guang	——	datemba
Fire	——	usi	ussi	——
Man	tämma	tama	tamma	ti
Father	käkka	iham	keneda	——
Son	——	uisaham	——	tshanu.

The short compositions of Hervas (given in the *Mithridates*) show the same.

Waikur Paternoster, with the German Interlineation, from the Mithridates.

Kepè-dáre tekereká-datembi dai ;
unser Vater gebogene Erd du bist ;
ei-rì akatuikè-pu-me ;
dichodas erkennen alle werden ;
tshakárrake-pu-me ti tschie ;
loben alle werden Leut und ;
ecùn gracia-ri acúme carè tekerekadatembi tschie ;
dien gratia o dass haben werden wir gebogene Erd und ;
eiri jebarrakemi ti pu jaupe datemba
dir o dase gehorsamen werden Menschen alle heer Erd,
pae ei jebarrakere aëna kéa ;
wie dir gehorsamen droben seynd ;
kepecun bu. kepe ken jatùpe untairi ;
unser Speis uns gebe dieser tag ;
catè kuitscharakè tei tschie kepecun atacamara
uns verzehe du und unser Böses ;
paè kuitscharrakère catè tschie cavape atukiàra keperujake ;
wie verzehen wir auch die Böses uns thun ;
catè tikakambà têi tschie ;
uns helfe du und ;
cuvumerà catè uè atukiàra ;
wollen werden Nicht wir etwas Böses ;
kepe kakunja pe atacara tschie. Amen.
uns beschutze von Bösen und. Amen.

The compound *tekereka-datembi = bent land = sky = heaven.*

To this very periphrastic Paternoster we may add the following fragments of the Waikur conjugation :—

Bè	amukirere =	*ego ludo*
Ei		*tu ludis*
Tutâu		*ille ludit*
Catè		*nos ludimus*
Petè		*vos luditis*
Tucáva		*illi ludunt*
Bè	amukiririkeri =	*ego lusi*
Ei		*tu lusisti*
Tutâu		*ille lusit*
Catè		*nos lusimus*
Petè		*vos lusistis*
Tucáva		*illi luserunt.*

Amukirimè=*ludere.*
Amukiri tei=*lude.*
Amukiri tu=*ludite.*

Bè-ri	amukiririkarikara=	*I wish I had not played*
Ei-ri		*Thou, &c.*
Tutâu-ri		*He, &c.*
Catè-ri		*We, &c.*
Petè-ri		*Ye, &c.*
Tucáva-ri		*They, &c.*

Of the *Pericu*, spoken at the south extremity of the peninsula, I know no specimens.

With this concludes the notice of the languages of *Old* California; languages belonging to the most neglected class in philology; languages of which our *data* are pre-eminently fragmentary; above all, languages which (from the probably approaching extinction) are destined to be but imperfectly known. All that can be said of them is, that they appear to graduate into each other, and that, at the neck of the peninsula, they certainly graduate into those of the mainland. That they are all *Yuma* is probable. What value is impressed upon the class by making them so is another question.

CHAPTER LVIII.

Languages of Sonora.—Mexico.—Guatimala.—Honduras.—Nicaragua, &c.

WITH the neck of the peninsula; the southern boundary of California; the northern boundary of Sonora; and the line of contact between the Cocomaricopas and the Pima Indians, begins a new division. Upon the difference between the Pimas and the Cocomaricopas, there is no want of decided statements. Many notices of the two populations are accompanied by comparative vocabularies, in which the difference is manifest—all the more so from the contrast it supplies to their topographical contact, and the similarity of their habits. They "agree in everything but their languages, and in this they differ" is the common (and true) statement concerning them.

But though the distinction is real, it must not be overvalued. At the same time the *Pima* class (of undetermined value) is a real one.

That it contains the *Pima* Proper, the *Opata*, and the *Eudeve*, may be seen from the *Mithridates*.

English.	Pima.	English.	Pima.
Man	huth	*Sun*	tahs
Woman	hahri	*Moon*	mahsa
Indian	huup	*Star*	uon
Head	mouk	*Snow*	chiah

Gua cai *tame* taotitudare ;
Cai naideni chiguadu—Apita cachià.

That the language of the Papagos, Papagocotam, is also Pima rests upon good external evidence. Whether the speech of the Ciris, and population of the island of Tiburon and the parts opposite, be also Pima, is at present uncertain.

The Ibequi belongs to the same class—slightly enlarged.

Hiaqui.

With these end our *data*, but not our lists of dialects; the names Maya, Guazave, Heria, Sicuraba, Xixiime, Topia, Tepeguana, and Acaxee all being, either in Hervas or elsewhere, applied to the different forms of speech of Sonora and Sinaloa; to which may be added the Tahu, the Pacasca, and the *Acasca*, which is probably the same word as *Acaxee*, just as *Huimi* is the same as *Yuma*, and *Zaque* as *Hiaqui*. Of the *Guazave* a particular dialect is named as the *Ahome*. Add to these the *Zoe* and *Huitcole*, which are probably the same as the Huite.

That some of these unrepresented forms of speech belong to the same class with the Pima, Hiaqui, &c., is

nearly certain. How many, however, do so is another question. It may be that *all* are in the same predicament; it may be only a few.

These languages lead us to the Mexican Proper; of which it is difficult to give the true *situs*. This is because it is a pre-eminently intrusive tongue. It is, probably, spoken beyond its original boundaries in every direction; sometimes (as in Central America) in isolated patches. Again—there are in many of the districts which, originally, belonged to the Mexican empire, local names of Mexican origin which are as strange to the spot on which they appear as the German or Russian names in Estonia, or Livonia. Thirdly, the ordinary name for the language—*Astek*—seems to be, word for word, the same as the Maya term *Huasteca;* a fact which suggests that the Mexicans were only Asteks in the way that the English are Britons, *i. e.* not at all, except so far as they took possession of a country originally British. The nearest approach to a true Mexican name, —a name which, in opposition to *Astek,* is Mexican in the way that *English* is English as opposed to *British* —is Nahuatl. At any rate, *Astek* is an inconvenient synonym for Mexican.

Of all the languages hitherto named, the one to which the Mexican is nearest allied, is the Tarahumara, through which it graduates, through the Cora, into the Sonora tongues, and through them to California, &c., &c.

That the sound expressed by *tl* is Mexican, may be seen from even the shortest vocabularies.

More has been written on the *Otomi* than any other language of these parts; the proper Mexican not excepted. It was observed by Naxera that it was *monosyllabic* rather than *polysynthetic,* as so many of the American languages are, with somewhat doubtful propriety, denominated. A Mexican language, with a Chinese characteristic, could scarcely fail to suggest

comparisons. Hence, the first operation on the Otomi was to disconnect it from the languages of the New, and to connect it with those of the Old World. With his accustomed caution, Gallatin satisfied himself with stating what others had said, his own opinion evidently being that the relation to the Chinese was one of analogy rather than affinity.

Doubtless this is the sounder view; and one confirmed by three series of comparisons made elsewhere by the present writer.

The first shows that the Otomi, as compared with the monosyllabic languages of Asia, *en masse*, has several words in common. But the second qualifies our inferences, by showing that the Maya, a language more distant from China than the Otomi, and by no means inordinately monosyllabic in its structure, has, there or thereabouts, as many. The third forbids any separation of the Otomi from the other languages of America by showing that it has the ordinary amount of miscellaneous affinities.

Hence, in respect to the Chinese, &c., the real question is not whether it has *so many affinities with the Otomi*, but whether it has *more affinities with the Otomi than with the Maya or any other American language;* a matter which we must not investigate without remembering that *some* difference in favour of the Otomi is to be expected, inasmuch as two languages with short or monosyllabic words will, from the very fact of the shortness and simplicity of their constituent elements, have more words alike than two polysyllabic forms of speech.

The fact, however, which most affects the place of the Otomi language is the quasi-monosyllabic character of other American languages, *e. g.* the Athabaskan and the Attacapa.

Of the *Pirinda* and *Tarasca* we have grammatical sketches, with abstracts of them, by Gallatin. The following are from the *Mithridates*.

Pirinda.

Hervas writes, that the Zapoteca (probably Maya), Mazateca, Chinanteca, and Mixe were allied. The Mixe locality is the district around Tehuantepec.

The *Maya* stands in contrast to the Mexican Proper (how it comports itself to the less known languages of its frontier is uncertain), by having a milder phonesis—such, at least, being the inference from the ordinary specimens.

The Maya, in the limited, or proper sense of the word, is the language of Yucatan. It is also the name of a group; *i. e.* it is used as a general, as well as a particular, term. Mr. Squier, who has done so much for the class that he ought to be allowed to fix its nomenclature, suggests the name *Tzendal.* I believe, however, that this is simply another form of *Chontal ;* a name which will re-appear in the sequel. Maya, too, is the older term. The Maya phonesis, in some of the dialects at least, is that of the Sahaptin and Shoshoni rather than the Atna and Tshinúk.

No tongue has more dialects (for they all seem to be this) which are designated by separate names and (as such) wear the garb of separate languages than the Maya.

* Possibly the Masya *dehmalu.*

Some may be so. I think, however, that they are dialects with independent names. The distribution of them is remarkable. There is a northern section, spoken in the parts about Tabasco, which in the present state of our knowledge is isolated. This is—

The *Huasteca*—word for word, *Astek*. The termination *-eca*, is Maya. The speculations which arise out of this similarity of name, as well as those which are suggested by the prevalence of the termination *-eca* in Mexican narratives, form no part of our present inquiries.

The *Kachiquel* is Maya : the Kachiquel being one of the chief languages of Guatemala.

So is the *Quiche*, called also the *Utlateca*.

So is the *Zutugil*, called also the *Zacapula*, with the *Atiteca*.

So is the *Poconchi, or Pocoman*.

So is the *Chorti*.

The *Mam* is, probably, the same. Is *Manche* another form of *Mam ?*

So, perhaps, is the *Popoluca*.

So is the *Tzendal*, spoken in Chiapas.

The *Lacandona*, spoken by some still independent tribes in Vera Paz, is, probably, in the same category with the Mam. No specimens, however, are known.

The *Ache*.—Of this Fray Francisco Gomez Torquemada writes that, "en a quella tierra (Guatemala) aprendio brevemente la Lengua *Ache :* que es la de sus Naturales y muy difficultuosa de aprender, porque le avia comunicado Dios el don de lenguas, que refiere su Apostol S. Pablo, y en ella aprovecho algunos años." Is it the same as the *Atiteca ?*

In the *Mithridates* is the notice of a *Zapoteca* language, but nothing more. Squier suggests that it may be the *Zacapula* or *Zutugil*,—at least his notice of a work by Fray Luis Cancer runs thus—

Varias Cancionies en Verso *Zapoteca* (*Zacapula?*) sobre los Misterios de la Religion, para el uso de los Neofitos de la Vera Paz.

Vera Paz is the *Zapoteca* locality as given by Adelung.

The displacement in Honduras, Nicaragua, &c., has been great. Hence of the languages other than Maya little is known; many of them being extinct.

The *Lenca* language is represented by four vocabularies from the four Pueblos of Guajiquiro, Opatoro, Intibuca, and Sirmlaton; that of the last being shorter and less complete than the others. They are quite recent, and are to be found only in the Spanish edition of Mr. Squier's Notes on Central America; the English edition being without them.

We now leave the Isthmus in order to take cognizance of three other groups, which have, apparently, been pretermitted in the preceding notices. These are the languages akin to the Sahaptin ; the languages akin to the Shoshoni ; and the languages of the Pueblo Indians—the groups being, to some extent, artificial.

CHAPTER LIX.

Sahaptin, Paduca, and Pueblo Languages.

THE reason why these languages, with their comparatively northern *situs*, have been left until the very frontier of South America is touched, lies in their geographical relations to the languages of the next division. As far as it has been practicable, we have, hitherto, kept to the west of the Rocky Mountains, having begun with the coast of the Pacific, because it was there that lay the nearest points of contact between America and Asia, and we have kept to the west, because, though different in its character under different circumstances, there has always been a connection between even such extreme languages as those of Central America and those of the Arctic Circle. Of course, this does not exclude a similar connection with the languages on the other side of the Rocky Mountains. Two chains of affinity, however, cannot be followed out at the same time. Meanwhile, that to which the preference has been given is, to say the least, a convenient, as well as a natural, one. The line, however, of the Rocky Mountains, themselves, is, by no means, purely and simply, a line from north to south. In Utah and New Mexico it takes us in the direction of the Atlantic.

This turns our attention to the parts about the Great Salt Lake, and (as the dialects there spoken have definite and decided affinities which run as far north as the

River Columbia) to certain districts in Oregon as well. Here present themselves several dialects referable to two groups. (1.) The *Sahaptin*, and (2.) the *Paduca*.

The *Paduca* forms of South Oregon and Utah seem to be *in situ;* those of New Mexico, Texas, and New Leon, &c. being intrusive. In respect to these, I imagine that a line drawn from the south-eastern corner of the Utah Lake to the source of the Red or Salt Fork branch of the River Arkansas, would pass through a country nearly, if not wholly, Paduca; a country which would lie partly in Utah, partly in New Mexico, and partly in Kansas. It would cross the Rocky Mountains, or the watershed between the drainages of the Colorado and the Missouri. It would lie along a high and barren country. It would have on its west the Navaho, Moqui, and Apatsh areas; on its east certain Sioux tribes, the Arapahos, and the Shyennes. It would begin in California and end in the parts about Tampico.

Three	pao	*Eight*	iatsa
Four	iaki	*Nine*	cohtsu
Five	onto	*Ten*	cokhi.

The comparative civilization of the Pueblo Indians has always attracted the attention of the philologue. Until lately, however, he had but a *minimum* amount of trustworthy information concerning either their habits or their language. He has now a fair amount of *data* for both.

Of the Pueblo languages two (the *Moqui* and *Zuni*) belong to the drainage of the Rio Colorado, and four (the *Tesuque*, the *Taos*, the *Jemez*, and the *Acoma*) to that of the Rio Grande.

(1.)

English.	Tesuque.*	English.	Tesuque.

Eight	——	cocomishia	cocumshi
Nine	——	maeco	maieco
Ten	——	'tkatz	cahtz.

The Moqui has decided Paduca affinities.

* Perhaps, more Sioux than aught else.

CHAPTER LX.

Languages between the Athabaskan, the Rocky Mountains, and the Atlantic. —The Algonkin.—The Sioux.—The Iroquois.—The Catawba, Woccon, Uche, Natchez, Chetimacha, Adahi, and Attacapa Languages.—The Pawni, Riccari, and Caddo.—The Languages of Texas.

UNLIKE the Eskimo and the Athabaskan, the *Algonkin* area touches the Ocean on one side only—being bounded on the west by the Rocky Mountains. Nevertheless, it is of great magnitude, being spoken in Labrador, and in North Carolina; on the Saskatshewan and the Potomac; in both the Canadas, in Nova Scotia, in New Brunswick, in the Hudson's Bay Country, and in every one of the United States north of Georgia. On the north it is bounded by the Athabaskan, the eastern half of the area whereof it subtends. The whole question, however, of its magnitude, along with that of the direction in which it extended itself, can scarcely be entertained until the main details of the two classes that succeed it, the Sioux and Iroquois, have been gone into.

Though the *Blackfoot* is one of the most recent additions to this class; in other words, though the Blackfoot is one of the languages which were the last to be recognized as Algonkin, I take it first—the Blackfoot being in contact with the Kutani and certain forms of the Athabaskan already named.

The *Bethuck* is the native language of Newfoundland. In 1846, the collation of a Bethuck vocabulary enabled me to state that the language of the extinct, or doubtfully extant, aborigines of that island was akin to those of the ordinary American Indians rather than to the Eskimo; further investigation showing that, of the ordinary American languages, it was Algonkin rather than aught else.

A sample of the evidence of this is to be found in the following table; a table formed, not upon the collation of the whole MS., but only upon the more important words contained in it.

English, son.
Bethuck, *mageraguis.*
Cree, *equssis.*
Ojibbeway, *ningwisis*
——— *negwis* } =my son.

The *Shyenne* language was suspected to be Algonkin at the publication of the *Archæologia Americana.* In a treaty made between the United States and the Shyenne Indians in 1825, the names of the chiefs who signed were either Sioux, or significant in the Sioux language. It was not unreasonable to consider this as *primâ-facie* evidence of the Shyenne tongue itself being Sioux. Nevertheless, there were some decided statements in the way of external evidence in another direction. There was the special evidence of a gentleman well-acquainted

with the fact that the names of the treaty, so significant in the Sioux language, were only *translations* from the proper Shyenne, there having been no Shyenne interpreter at the drawing-up of the document. What then was the true Shyenne? A vocabulary of Lieut. Abert's settled this as far as the numerals went. Afterwards a full vocabulary, collated by Gallatin, gave the contemplated result:—"Out of forty-seven Shyenne words for which we have equivalents in other languages, there are thirteen which are indubitably Algonkin, and twenty-five which have affinities more or less remote with some of the languages of that family."*

Arapaho is the name of a tribe in Kansas; occupant of a district in immediate contact with the Shyenne country.

But the Shyennes are no *indigenæ* to Kansas. Neither are the Arapahos. The so-called Fall Indians, of whose language we have long had a very short trader's vocabulary in Umfreville, are named from their occupancy, which is on the Falls of the Saskatshewan. The Nehethewa, or Crees, of their neighbourhood call them so. Another name is *Big-belly*, in French *Gros ventre.* This has given rise to some confusion; *Gros-ventre* being a name given to the Minetari of the Yellow-stone River, who belong to the Sioux family. Not so the *Gros-ventres* of the Falls. Adelung remarked that some of their words had an affinity with the Algonkin. Umfreville's vocabulary was too short for anything but the most general purposes and the most cautious of suggestions. It was, however, for a long time the only one known. The next to it, in the order of time, was one in MS., belonging to Gallatin, but which was seen by Dr. Prichard and collated by the present writer. His enquiries were simply to the effect that the language had certain miscellaneous affinities. A vocabulary in Schoolcraft

tells us more; viz. not only that the Arapaho language is the same as the Fall Indian of Umfreville, but that it has definite and preponderating affinities with the Shyenne, and, through it, with the Algonkin class in general, especially with the Menomeni.

The old languages of the Carolinas, Georgia, and Florida were—

1. The Wataree.*
2. The Eeno—Compare this name with the Texian Ini ;
3. The Chowah, or Chowan ;
4. The Congaree ; *
5. The Nachee—Compare with Natchez ; word for word ;
6. The Yamassee ;
7. The Coosah—Compare (word for word) with Coosada, and Coshatta.

In the south lay the Timuacana—of which a few words beyond the numerals are known.

In West Florida and Alabama, the evidence (I still follow the *Mithridates*) of Du Pratz scarcely coincides with that of the account of Nuñez de Vaca. This runs thus.

In the island of Malhado were spoken languages of

1. The Caoques ;
2. The Han.

On the coast—

3. The Choruico—Cherokee ?

* The name Riccaree, probably, belongs to these parts.

4. The Doguenes.
5. The Mendica.
6. The Quevenes.
7. The Mariames.
8. The Gualciones.
9. The Yguaces.
10. The Atayos—Adahi? This seems to have been a native name—"*die sich Atayos nennen.*"
11. The Acubadaos.
12. The Quitoles.
13. The Avavares—Avoyelles?
14. The Muliacone.
15. The Cutalchiche.
16. The Susola.
17. The Como.
18. The Camole.

Of migrants from the east to the west side of the Mississippi, the *Mithridates* gives—

1. The Pacana, conterminous with the Attacapas.
2. The Pascagula? Muscogulge.
3. The Biluxi? Apalach.
4. The Appalach? Apelousa.

The Taensa are stated to be a branch of the Natchez.

The Caouitas are, perhaps, word for word, the Conchattas; also the Coosa, Coosada, Coshatta.

The Stincards are, word for word, the Tancards = Tuncas = Tunicas.

The *Cherokee* is spoken, at the present moment, by more individuals than any other Indian tongue. Many of the Cherokees have taken up a portion of the American civilization; cultivate land, hold slaves, and increase in numbers. The language is also spoken by many who are other than Cherokee in blood. It is written, and that in a syllabic alphabet, excogitated by a native Cherokee, in Africa, named *Sequoyah*, or *Guess*. Like the

Vei, however, it is no evidence to the truly indigenous independent growth of an alphabet. Guess knew the English alphabet, *i. e.* he knew that languages could be reduced to writing, and the principles on which an alphabet could be formed. In this lies the real invention of an alphabet; an invention which the present writer maintains has only been made once.

In a country like Texas, where the spread of the population from the other portions of the Union has been so rapid, and where the occupancy is so complete, we are prepared to expect but a small proportion of aborigines. And such, upon the whole, is the case. The displacement of the Indian tribes has been great. Even, however, when Mexican, Texas was not in the category of the older and more original portions of Mexico. It was not brought under the *régime* of the missionaries.

The notices of Texas in the *Mithridates*, taken along with our subsequent *data*, are to the effect that (*a*) the *Caddo*, (*b*) the *Adaize* or *Adahi*, (*c*) the *Attakapa*, and (*d*) the *Choktah* are the prevailing languages of Texas; to which may be added a few others of minor importance.

The details as to the distribution of the subordinate forms of speech over these four leading languages are as follows:—

a. The Nandakoes, Nabadaches, Alich (or Eyish), and Ini or *Tachi* are expressly stated to be *Caddo;* and, as

it is from the name of the last of these that the word *Texas* is derived, we have satisfactory evidence that *some* members, at least, of the Caddo family are *truly and originally* Texian.

b. The Yatassi, Natchitoches, Adai*zi* (or Ada*hi*), Nacogdoches, and Keyes, belong to the Caddo confederacy, but without speaking the Caddo language.

c. The Carancouas, the Attacapas, the Apelusas, the Mayes, speak dialects of the same language.

d. The Tunicas speak the same language as the Choktahs.

Concerning the philology of the Washas, the Bedies, the Acossesaws, and the Cances, no statements are made.

It is obvious that the information supplied by the *Mithridates* is measured by the extent of our knowledge of the four languages to which it refers.

Of these, the Choktah, which Adelung calls the Mobilian, is the only one for which the *Mithridates* itself supplies, or could supply, specimens; the other three being unrepresented by any sample whatever. Hence, to say that the Tachi was Caddo, that the Yatassi was Adahi, or that the Carancoua was Attacapa, was to give an instance, in the way of explanation, of the *obscurum per obscurius.* Since the publication of the *Mithridates,* however, we have got, as has been seen, samples of three more—so that our standards of comparison are improved. They are to be found in a tabulated form, and in a form convenient for collation and comparison, in both of Gallatin's papers. They were all collected before the annexation of Texas, and they appear in the papers just referred to as Louisiana, rather than truly Texian, languages; being common to the two areas.

The later the notice of Texas the greater the prominence given to a tribe of which nothing is said in the *Mithridates,* viz. the *Cumanch.* As late as 1844 we had nothing beyond the numerals and a most scanty

MS. list of words to tell us what the Cumanch language really was. These, however, were sufficient to show that its affinities ran northwards, and were with the Shoshoni.

The tendency of the *Mithridates* is to give prominence to the Caddo, Attacapa, and Adahi tongues, and to incline the investigator, when dealing with the other forms of speech, to ask how far they are connected with one of these three. The tendency of the later writers is to give prominence to the Cumanch, and to suggest the question: How far is this (or that) form of speech Cumanch or other than Cumanch?

Working with the *Mithridates*, a MS. of Mr. Bollaert, and Mr. Kennedy's volume on Texas before me, I find that the list of Texian Indians, which these authorities justified me in publishing in 1848, contained (1) Coshattas; (2) Towiachs, Towakenos, Towecas, and Wacos; (3) Lipans or Sipans; (4) Aliche or Eyish; (5) Acossesaws; (6) Navaosos; (7) Mayes; (8) Cances; (9) Toncahuas; (10) Tuhuktukis; (11) Unataquas or Anadarcos; (12) Mascovie; (13) Iawanis or Ionis; (14) Wico? Waco; (15) Avoyelles; (16) Washitas; (17) Ketchi; (18) Xaramenes; (19) Caicaches; (20) Bidias; (21) Caddo; (22) Attacapa; (23) Adahi—besides the Carankahuas (of which the Cokes are made a branch) classed with the Attacapa, and not including certain Cherokees, Choktahs, Chikkasahs, and Sioux.

A *Washita* vocabulary, which will be referred to in the sequel, concludes the list of Texian languages known by specimens.

At present, then, the chief question respecting the philology of Texas is one of distribution. Given as centres to certain groups—

1. The Choktah,
2. The Caddo,
3. The Adahi,
4. The Attakapa,

5. The Cumanch, and
6. The Witshita languages,

how do we arrange the tribes just enumerated? Two works help us here:—1. A letter from the Ex-president Burnett to Schoolcraft on the Indians of Texas. Date, 1847. 2. A Statistical Notice of the same by Jesse Stem. Date, 1851.

Stem's statistics run thus:—

Tribes.	*Numbers.*	
Towacarros	141	293
Wacos	114	
Ketchies	38	
Caddos	161	476
Andarcos	202	
Ioni	113	
Tonkaways	1152	
Wichitas	100	
Lipans	500	
Comanches	20,000	

giving us several of the names that have already appeared; giving also great prominence to the Cumanches —numerically at least.

In Mr. Burnett's Letter the term *Caddo* is prominent; but whether it denote the Caddo *language*, or merely the Caddo *confederation*, is uncertain. Neither can I find from the context whether the statements respecting the Indians of the Caddo connection, for this is what we must call it at present, are made on the personal authority of the writer, or whether they are taken, either directly or indirectly, from the *Mithridates*. The term that Burnett used is *stock*, his statement being that the Waco, the Tawacani, the Towiash, the Aynic, the San Pedro Indians, the Nabaduches, and the Nacodocheets are all both Texian in origin and Caddo in *stock*.

His other tribes are—

1. The *Ketchi*: a small tribe on Trinity River, hated by the Cumanches as sorcerers, and, perhaps, the same as—

2. The *Hitchi*, once a distinct tribe, now assimilated with their neighbours.

3. The *Tonkaways*, a separate tribe, of which, however, the distinctive characters are not stated.

Whatever may be the exact details of the languages, dialects, and subdialects of Texas, the general outline is simple.

The *Choktah* forms of speech are anything but native. They are of foreign origin and recent introduction. So are certain Sioux and other dialects spoken within the Texian area.

The *Cumanch* is in the same predicament; though not, perhaps, so decidedly. It belongs to the Paduca class, and its affinities are with the Shoshoni and Wihinast of Oregon.

The *Caddo* Proper is said to be intrusive, having been introduced so late as 1819 from the parts between the Great Raft and the Natchitoches or Red River. I hold, however, that *some* Caddo forms of speech must be indigenous.

The *Witshita* is probably one of these:—

English.	Caddo.	Witshita.
Head	cundo	etskase
Hair	beunno	deodske
Eye	nockkochun	kidahkuck
Nose	sol	dutstistoe
Mouth	nowoese	hawkoo
Tongue	ockkotunna	hutskee
Tooth	ockkodeta	awk
One	whiste	cherche
Two	bit	mitch
Three	dowoh	daub

The *Attakapa* is one of the pauro-syllabic languages of America, by which I mean languages that, if not monosyllabic after the fashion of the languages of south-eastern Asia, have the appearance of being so. They form a remarkable class, but it is doubtful whether they form a natural one, *i. e.* whether they are more closely connected with each other in the other elements of philological affinity than they are with the tongues not so characterized.

The Adahi or Adaize (? Yatassi) and the Attakapa are the two most isolated languages of North America, each having, however, miscellaneous affinities.

As the languages to the west of the Attakapa have already been noticed, so those of South America now come under consideration.

CHAPTER LXI.

Languages of South America.—New Grenada.—The Quichua.—The Aymara.—The Chileno.—The Fuegian.

It may safely be said that there is no part of the world, of which the Comparative Philology is more uncertain and obscure than South America. That there are vast tracts elsewhere, for which our *data* are scantier, is not denied. Scanty, however, as they may be, they are, generally, better arranged; for in South America, though our materials are by no means deficient, our classification is at its *minimum*. The notices of the *Mithridates* were chiefly taken, either at first hand or through Hervas, from the Jesuit missionaries, whose communications were all of the same character. They gave us almost always a Paternoster, occasionally a hymn, sometimes the numerals, more rarely a full and copious general vocabulary. They also, for the most part, gave us a very compendious grammar or *Arte;* a grammar or *Arte,* in which the principles of the ordinary Latin Grammar of Europe were applied to forms of speech to which they are wholly unsuited. Besides their inherent imperfections, these *Artes* have the additional demerit of being amongst the scarcest of philological works. They are, for American books, old; the majority being of the

seventeenth century. They are printed in Lima and other Transatlantic towns, rather than in Madrid or Lisbon. Finally, they are often in MS. That many of these were known to Adelung, is shown in almost every page of his great work. Perhaps he knew of most of them. Nevertheless, as a mere matter of bibliography some have been noticed, and that for the first time, since his death. So far, then, as this is the case, they give us new materials. That the main mass, however, of our fresh *data* consists of fresh observations is no more than what we expect; no more than the actual fact. Still, compared with what has been done elsewhere, they are few Whoever goes over the elaborate bibliographical work of Ludwig may see this. He may see that the number of languages for which there are few or no authorities later than Hervas is inordinately large; so large, as to convince us that, whether by investigators on the spot or by enterprizing travellers, the philology of South America has been (as compared with that of other countries) greatly neglected. He will see that, for all has been done in recent times, the names of Spix and Martius, Prince Maximilian of Neuwied, Castelnau, D'Orbigny, Sir Robert Schomburgh, and Wallace (each in his own special area), give a monopoly of authority. Where these writers have either observed or collected, we have a fairly-illustrated district. Elsewhere there is sad barrenness.

The parts, then, where the most has been done, are Brazil (a vast area), the Missions of Moxos and Chiquitos, along with parts of Peru, British Guiana, and the parts to the west of the Rio Negro; more especially the valley of the Uapés. In New Grenada also, of the languages whereof the information of the *Mithridates* is of the scantiest, we have a fair mass of new details collected by the occupants of the republic itself. They are, however, from the fact of their being chiefly published in Bogota, pre-eminently

inaccessible. To the present writer at the present time, the very existence of them is known almost wholly through Ludwig's notices.

The parts for which our knowledge is most pre-eminently stationary are, Venezuela, Peru, Chili, the Argentine Republics, Paraguay, and Patagonia.

Again; as the organization of the Missions is less complete amongst the Portuguese than it is (or was) amongst the Spanish populations of the New World, the difference between the amount of research bestowed upon the aborigines of New Grenada, Peru, &c. and those of Brazil, is considerable.

The details, then, of Portuguese America are more unsatisfactory than those of Spanish. In those parts of the continent which belong to England or Spain, or which have been Dutch, the philology has been left to accident—so that in respect to them we are in no better position than we are with the languages of the Hudson's Bay Territory and the English portion of Oregon—a worse position than we are in with respect to those of the United States; where a partial investigation has been undertaken by the Government. This means that a list of words has been prepared which is filled up as new languages present themselves; a plan which, whilst it stimulates and directs inquiry, makes classification a simple matter of inspection.

The natural road from North to South America is by the way of the Isthmus. At the same time the fact of the West-India Islands forming a second chain of communication must not be overlooked.

In the present chapter, the plan adopted in North America will be followed, *i. e.* the languages to the west of the Andes will be treated first. The great block of land drained by the Orinoco, the Amazons, and the Rio de la Plata will follow; and Brazil will come last.

There are affinities in both directions. The first line, however, is the one which is most conveniently taken.

For New Grenada, but few vocabularies are known to me—the *Artes*, &c., referred to by Ludwig, being difficult of access.

Beginning with the parts to the south of the *Chol* and *Muysca* (now called *Chibcha*) areas for which a few words only are known to me, we come to the—

The title of the earliest grammar of the *Peruvian* is *Gramatica ò arte general de la lengua de los Indios del Peru ; nuevamente compuesto por el Maestor Fray Domengo de San Thomas de la order de Santa Domengo en dichos reynos.* The precise date of this is A.D. 1560. In the Dictionary, however, bearing the same date, the language is called the *Lengua General de la Peru, Llamada Quichua.* The particular tribe with which this term originated was that of the Quichua on the Aymara frontier and conterminous with the Collas.

Of the dialects, the most northern is the Quiteno of Quito. Then follow, the Chinchasuya, between 11° and 13° S. L.; the Cauki of certain districts to the south of Lima; the Lamano of the parts about Truxillo; the Cuzcucano of Cuzco; and, finally, the Calchaqui of Tucuman.

The *Aymara* area has its historical centre in the parts about the Lake Titicaca, where the famous Peruvian legislator, Mango Capac, first made his appearance. The monuments of Tiaguanaco and Carangas belong to it. So do those numerous tombs containing the artificially flattened skulls upon which so much has been written by ethnologists. According to Garcillasso de la Vega it was the third Inca, Llogue Yupanqui, who brought the Aymaras under the Quichua dominion. They lie between 15° and 20° S. L., occupants of the highest range of the Andes, on both sides. Some of them belong to the drainage of the La Plata, being found on the upper part of the Pilcomayo. This brings them in contact with Chaco tribes; whilst in the direction of Bolivia they touch the Chiquitos. As a general rule, however, they are surrounded by the Quichua dialects, by which they have, to all appearance, being encroached on; indeed, the capital Cuzco, Quichuan as it is in many respects, is a town upon Aymara ground. So is Potosi; so also a great portion of the Provinces of Tinto, Arequipa, La Paz, and Chuquisaca, with considerable parts of Tarapaca and Atacama.

The *Mithridates* names the Lupaca as the commonest, and the Pacase as the most refined of the Aymara dialects; amongst which are enumerated the Canchi, the Cana, the Colla, the Collagua, the Caranca, and the Charca; this last being conterminous with the Guarani Chiriguanos.

Word for word, *Baniwa* is, probably, *Maniwa*, *Maniva*, *Poignavi*, and *Guipoignavi* of other writers —especially does it seem to be, word for word, the

Guipoignavi of Humboldt. Now the Baniwa districts are those through which runs the frontier between Brazil and Venezuela. There are also those which give us the point where the researches of Mr. Wallace from the South, and of Humboldt from the North, respectively terminated; the former having moved upwards from the Rio Negro, the latter downwards from the Orinoco. Now as Humboldt names the language for the parts in question *Poignavi*, giving two words of it, one of which (*oueni = water*) coincides with the *uni* and *weni* of Wallace's *Baniwa*, the identification under notice is legitimate.

There are (at least) three dialects of the Baniwa, *eo nomine*—the Baniwa of the river Isanna, the Baniwa of the Tomo and Maroa rivers, and the Baniwa of the Javita; this last being spoken beyond the boundary, *i. e.* in Venezuela.

The affinities between the *five* forms of speech under notice appear to run just as Mr. Wallace has arranged his specimens of them, *i. e.* Tariana, *Baniwa* of the Isanna, *Barree*, Baniwa of the Tomo and Maroa, and Baniwa of the Javita. Between the extremes there is a considerable difference: a fact which should lead us to reflect upon what would be our opinion if, instead of being preserved, the intermediate forms had been lost. This would depend, to a great extent, upon the way in which these extremes were represented; it being certain that, if our specimens represented those parts of the two forms of speech which differed rather than those which agreed with each other, we should pronounce them to be separate languages.

English.	Baniwa (Isanna).	Barree.	Baniwa (Javita).	Baniwa (Toma and Maroa).

The *Üaenambeu*, or *Humming-Bird Indians*, lie beyond the districts personally visited by Mr. Wallace, *i. e.* on the Lower Japurá. He met, however, with some of them on the Rio Negro, and obtained some information concerning them, as well as a vocabulary of their language. He connects them more especially with the Coretu and the Juri. The point, however, of most importance concerning this Uaenambeu vocabulary is the fact of its representing the language of a group of tribes already known to us—already known to us under the name Mauhé.

The *Coretu* lie on the Apaporís, between the Uapés and the Japurá. The Tucano belong to the same rivers :

the Cobeu to the main stream of the Uapés. The Cobeu, Tucano, and Coretu, are members of the same class; the exact value of it being uncertain. The Cobeu bore their ears, and enlarge the hole until it will take in a bottle-cork; hereby illustrating our remarks on the word *Orejones*. The reason for writing *Coretu of Wallace* lies in the fact of there being in Balbi another Coretu vocabulary: which, with the exception of one word (*haie = aoue = sun*) is *not* the language of the vocabularies more especially under notice.

The *Juri* lie between the Ica and the Japurá, and are called, also, Juripixunas = Black Juri, and Bocaprietos = Blackmouths from the custom of tattooing the parts about the mouth in such a manner as to resemble the black-mouthed squirrel-monkeys (*Callithrix sciureus*). A portion of them has migrated to the Rio Negro, settled there, and become more or less civilized.

English.	Uaenambeu.	Juri.	Coretu.

For these latter dialects our chief authority is Sir R. Schomburgh. The number of vocabularies as collected by him during his expeditions into the interior, is eighteen, none of which, he states, bear a closer affinity to each other than the French and Italian. This statement, however, is one which the present writer is not prepared to adopt. Of these eighteen vocabularies, only one or two have been published *in extenso*. From the report, however, of the British Association for the Advancement of Science, A.D. 1848, the foregoing short extracts have been taken.

(1.)

Three	mozapyr	mozapu	——

The *Iquito*, akin to the preceding—

English.	Iquito.	English.	Iquito.
Man	icouan	*Ear*	quiatoum
Woman	icouan	*Hand*	yanamaca
Head	manaca	*Foot*	quiainoi
Eye	panami	*Sun*	yanamia
Nose	cachirica	*Moon*	cashi
Mouth	kainga	*Water*	aqua.

Of the *Xumano* or *Chomano*, I only know the following words.

English.	Xumano.
Sun	sima
Moon	vueta
Star	vuete.

For the *Mayoruna* Castelnau has given two vocabularies, one representing the language of the converted, the other that of the unconverted, tribes.

English.	Mayoruna (1).	Mayoruna (2).
Man	dara	dara
Woman	shirawa	tirahua
Head	moho	macho
Eye	bedo	——
Nose	dehan	dizan
Mouth	ibi	ira
Ear	pabauan	pahiuran
Hand	macou	poro
Foot	tacu	tahi
Sun	bari	bari
Moon	oueu	houiji
Water	waca	houaca.

Mayoruna is a name which occurs in the *Mithridates*; the Mayoruna language being said to belong, with the Barbudo, Iturale, and Musimo forms of speech, to the Urarina class.

It is safe to say that the *Peba*, *Yagua*, and the *Orejones* forms of speech are more closely connected with each other than any of them is with anything else. The exact amount of affinity is uncertain, though there can

be but little doubt that the three languages are mutually unintelligible. The Aissuari, the Yurumagua, and the Cahumari languages, mentioned in the *Mithridates*, but not represented by any specimen, are likely to have belonged to this class. It may easily, however, be imagined that the distribution of unrepresented languages over classes like those before us is doubtful. What may probably have been Peba, or Urarina, may, with nearly equal probability, have been Omagua, Iquito, or aught else.

As *Orejones* means *large-eared*, it must be dealt with as a common rather than a proper name. If so, it may occur in more quarters than one; *i. e.* whenever ears are either naturally large or artificially enlarged along with a language in a neighbourhood where *orejo* = *ear*. The same applies not only to *Barbudo*, *Encabellado*, (?) *Zapara* (*Xeberro ?*), and other names of European, but to many of even American origin; as may be seen by paying attention to the manner in which (*inter alia*) certain words ending in *-mayo*, and *-agua*, present themselves at long distances from each other—these words being Guarani.

English.	Oregones.	Peba.	Yagua.
Man	comai	comoley	huano
Woman	erigno	watoa	huatarunia
Head	huha	raina	firignio
Eye	oi	vinimichi	huirancai
Nose	hoho	vinerro	unirou
Mouth	huai	rito	huicama
Ear	kinoleo	mitiwa	ontisini
Hand	onokui	vinitaily	huijanpana
Foot	etaiboi	vinimotay	moumoumatou
Sun	idoma	wana	ini
Moon	hiutsara	remelane	alemare
Water	ainoe	ain	haha.

Wherever the *ticuna* poison is used, with a population in the neighbourhood which uses the name, *Ticuna* Indians may be expected; and any two groups of such may be in any degree of relationship. One of Cas-

telnau's vocabularies gives us a language under this name. It stands well apart from the ones that have already been noticed; but, as the samples are short, we should remember that Hervas states that the Peba and Ticuna (also called Xumano) are connected.

English.	Ticunas.	English.	Ticunas.
Man	iate	*Ear*	nachinai
Woman	niai	*Hand*	tapamai
Head	nahairou	*Foot*	nacoutai
Eye	nehaitai	*Sun*	iakai
Nose	naran	*Moon*	tahuaimaika
Mouth	naha	*Water*	aaoitchu.

Further south on the frontier of the Quichua we have, from a longer list of Osculati's, the following words for the *Zapara*.

English.	Zapara.	English.	Zapara.
Man	taucko	*Sun*	janockua
Head	anackaka	*Star*	naricka
Ear	taurike	*Moon*	cacikua
Eye	namisia	*Fire*	anamicukucia
Nose	mihucua	*Water*	muriccia

Beard	amu	*Egg*	ickuqua
Arm	curemasaca	*Belly*	marama
Hand	hickoma	*Foot*	hinocka
Day	nuackate	*Blood*	nunacke.
Night	nignacka		

To these parts belongs the following Paternoster of the—

Yamea.

Neike ahen arrescunia abecin; termò atiahua renumucha hoe tanla; habecia nei-nin; anto nein arresiuma hoe baceiada renua nanca naerrà iño popo nin; mirlè termò pahoinlama nei amiziarà aintanei errama; halayan nei nei huchanla tirra nei holayan lobua remorezio-nei; lara hiamuerra nei han hucha-nen; tiarre ala ninze harramale nei.

These languages belong to Ecuador; south of which is a great gap. Hence the next chapters begin on the

eastern Andes at the sources of the Beni and Mamore, and (crossing the watershed) of the Vermeyo and Pilcomayo. The division of these into the languages of (1.) the Missions, and (2.) the Chaco, is, more or less, artificial; as is the secondary division of the Missions into those of (*a*) Moxos, and (*b*) Chiquitos. For the Peruvian affinities of this class the Aymara, from its being *in situ*, is more important than the Quichua.

CHAPTER LXIII.

The Moxos, Chiquitos, and Chaco Languages.

In the following list, the first language is in contact with the Quichua and Aymara, with which it is, probably, more closely allied than the present classification makes it. Here it is treated as transitional to the Peruvian and the languages of the Missions.

In 1831 the number of the *Cayuvava* was 2073, all of whom were Christians of the Mission of Exaltacion. Their original locality lay about 12° S. L. where they were conterminous with the Movima, and Itenes.

In 1830, the number of the *Movima* was 1238, all of whom were Christians in the Mission of Santa Anna. Their original locality was about 14° S. L. where they were conterminous with (*inter alios*) the Cayuvava and the Moxos.

In 1830, the number of the Itonama was, at

The Mission of Magdalena	2831
——————— San Ramon	1984
Total . . .	4815

All Christian.

At the junction of the Iténès with the Mamoré, the

Iténès language is spoken by 1000, or 1200 individuals, whose name (Iténès or Itè) is native.

Chiquitos is no native, but a Spanish name; the name which the chief divisions of the group give themselves being *Nagiuñañeis = men.* It is from them that the Mission of Chiquitos takes its name, in the centre of which the *Chiquito* Proper is spoken by some 14,000 souls. The language is important now, and was important originally. At the present time it serves as a sort of Lingua Franca, being the form of speech which numerous other tribes who, without learning Spanish have unlearned their own language, have adopted. It was important in the time of Hervas, when it fell into two dialects, three older ones having previously become extinct, or nearly so. Of these one was the *Manaz;* the tribes that spoke it being—

The Manzica
— Yuracareca
— Sibacca
— Cuzica
The Quimomoca
— Tapacuraca
— Yirituca.

The existing dialect of the *Tao* is spoken by—

The Tao
— Boro
— Tabüca
— Tañepica
— Xuhereca
The Peguica
— Bocca
— Tubaciaca
— Aruporeca.

and part of the Piococo—the *Piñoco* being the language of

The Piñoco Proper
— Quimeca
— Guapaca
— Quitaxica
The Poxisoco
— Motaquica
— Zamaquica
— Taumtoca

and part of the Piococo.

The termination *-ca* is specially stated to be a Chiquito plural. It does not, however, follow that every tribe bearing it was Chiquito. All that is actually

needful to account for the term is a Chiquito neighbourhood in which the name may have originated.

Of the tribes that speak the language known by the general name of *Zamucu*, or *Samucu* (this particular form of speech being only one out of several) some are settled in the Missions of San Giovanni, San Iago de Chiquiti, and San Ignacio, while some run wild in the more impracticable districts of the forest country around them—conterminous in some part, at least, of their frontier with the Chiriguanos. Hervas gives us three main dialects.

1. The *Zamucu*, in the limited sense of the term, spoken by the Zamucu Proper, the Satienos, and perhaps, the Ugaraños—the testimony as to these last being doubtful ; since, according to some, they have a peculiar language of their own.

2. The dialects of the Caipotocado, Tunachas, Imomos, and Timinahas.

3. The Morotoco of the Morotocos Proper, the Tamoenos, the Cucurates, or Cucutades, the Panonos, and (perhaps) the Careras and the Ororebates.

Such is the list of Hervas of the Zamucu tribes as they stood in his time. The names that I find in D'Orbigny are Zamucu, Morotoco, Potarero, and Guaraneco.

Of the Chaco languages, the Mataguaya is the most akin to the Chiquitos ; the Vilela and Lule to the Aymara.

CHAPTER LXIV.

Languages of Brazil.—Guarani.—Other than Guarani.—Botocudo, &c.—Languages neither Guarani nor Botocudo.—The Timbiras.—The Sabuja, &c.

THE Lingua Geral, or current Indian of the Empire, is Guarani; a language which is not only spoken by many Portuguese, but one for which several native tribes of comparatively small importance have exchanged their own. Little, however, will be said about the Guarani, the general phenomena connected with its remarkable distribution being commonly known. A form of speech akin to it is spoken on, or even within, the frontier of Ecuador; whilst others are spoken on the Rio Negro, on the lower Amazons, along the coast of the Pacific as far as the neighbourhood of Monte Video, in Paraguay, and by the Chiriguanos and Sirionos on the frontier of Peru. That the tribes which use this tongue are numerous we readily believe: nor are there wanting long lists of them. The present writer has collected more than forty. The statement, however, that such and such populations speak the same language is one thing; an actual specimen of the language itself, *eo nomine*, is another. This is often wanting, or, at any rate, the specimen is a short one. Yet it may consist of only a single word and still have its value. The chief Guarani languages are—

1. The Omagua.

2, 3, 4. The Tupi, Tupinambi, and Tupinaquin.

5. The Guarani Proper of Paraguay and the South-west.

6. The Chiriguano of the South-west on and within the frontier of Peru.

To the *Botocudo* class belong (1.) the *Botocudo* Proper, spoken between 18° and 20° S. L. (2.) The *Jupuroca*, spoken on the Mucury near the town of Caravellas, apparently, but not necessarily, falling into six sub-divisions. Such at least is the inference from the statement that the names of the heads of the several Jupuroca chiefs are (1.) Guiparoca, (2.) Potica, (3.) Tupi, (4.) Mechmech, (5.) Megwi Megu, (6.) Uroue. (3.) ? Mucury.

About the languages of the next class little is said in the *Mithridates;* more in the Travels of Spix and Martius, and of Prince Maximilian of Neuwied. Balbi throws them all into a single group, which he calls the Machacari-Camacan. The area of this group is conterminous with that of the Botocudos; whilst the author from whom these vocabularies are taken, commits himself to the statement that the Machakali bears a decided similarity to the Botocudo, having both a guttural and a nasal pronunciation. At any rate the Rio Mucury is occupied by both the Proper Mucury tribes and the Machakali, or Machakaris; though the present writer, who, without hesitation, treats the Machacari-Camacan of Balbi and the Botocudo as separate sections of the same group, considers that the nearest congeners to the Botocudo are the Mongoyos and Malali.

The Guanans of Martius live between the Paraguay and the Sierra de Chainez and are stated to be related to the Caháns, Coahunas, or Men of the Wood, whom the Guacurus call Cayubabas. To this add that the *Guana* vocabulary of Castelnau is given by Ludwig to these same Guanans. If so, we may compare it to the Cayubaba, or Cayuvava, of the mission of Moxos. Doing this we shall find that the resemblance is of the slightest, consisting chiefly (perhaps wholly) in that between

English.	Guana.	Cayubaba.
Tongue	na-hanai	inè

But what if there are two Cayubabas?

on a mere cursory and superficial inspection. The Eskimo is a definite class, with its maximum of difference on the side of the Atlantic. The Athabaskan is also a definite class when compared with the Algonkin, which underlies it when we pass the Rocky Mountains. On the side, however, of the Pacific, the phenomena of transition present themselves. The Kenay was not generally recognized as Athabaskan, until compared with the Loucheux ; and, as long as the Kenay was unfixed, the Ugalents and its congeners were unfixed also. As it is, they form a definite sub-class, with Eskimo affinities on one hand, and Atna affinities on the other ; the Kolush being truly transitional. The Chesmesyan, the Hailtsa, the Wakash, and the Chinuk, are connected through their miscellaneous affinities, and are all characterized by their harsh phonesis. The Jakon and Kalapuya lead to the languages of the Sahaptin and Shoshoni phonesis—among the congeners of which the sound of *tl* appears and reappears. In the Mexican, this becomes prominent ; and in the Maya, to say the least, has no inordinate prominence.

Between the Rocky Mountains and the Pacific, the Algonkin, with its intrusive character and wide diffusion, has done so much in the way of the displacement and obliteration of such forms of speech as may have shown signs of transition that it is the best-marked class on the continent. Its spread, however, appears to have been from west to east, and the result of it has told most on the fragmentary and isolated languages of the Iroquois family, which it has affected in the way that the Turk and Russian have affected the Ugrian. In its ordinal value, it is, apparently, higher than the Turk, the Mongol, or the Túngus ; lower than the Fin. Taking it along with the Athabaskan and its congeners as far as American Oregon, and with the Eskimo, it probably forms a class to which the Iroquois, the Sioux, the Catawba, the Uche (with its congeners), and (perhaps) the Caddo, form a

CHAPTER LXV.

General Remarks on the American Languages.

THE primary division is that between North and South America; the difference between them being partly real and partly what may be called *subjective*. It is real, because the Isthmus of Darien is a narrow neck of land, and the points of contact between the two peninsulas are few; nor are they notably increased by taking in the West-Indian Islands as a second passage.

It is *subjective* (by which I mean that it is referable to our want of knowledge) through the scantiness of our materials for Nicaragua, Costarica, Honduras, and St. Salvador on the one side, and for New Grenada on the other. There is, then, a true want or deficiency of investigation, and there is, also, the fact of the displacement and obliteration of the native tongues having been great. Nevertheless, the coincidences between the two classes are numerous.

In North America the connection with Asia is decided. Through the Aleutian dialect of the Eskimo, and the Kamtshatkan, it is direct. Through the Yukahiri and other tongues it is indirect. That this affinity was concealed so long as we took the Eskimo in the Atlantic portion of its area, and compared, or contrasted, it with the Algonkin—itself on its Atlantic side also—has already been stated; and it may be added that, even on the side of the Pacific, it is, by no means, apparent

on a mere cursory and superficial inspection. The Eskimo is a definite class, with its maximum of difference on the side of the Atlantic. The Athabaskan is also a definite class when compared with the Algonkin, which underlies it when we pass the Rocky Mountains. On the side, however, of the Pacific, the phenomena of transition present themselves. The Kenay was not generally recognized as Athabaskan, until compared with the Loucheux ; and, as long as the Kenay was unfixed, the Ugalents and its congeners were unfixed also. As it is, they form a definite sub-class, with Eskimo affinities on one hand, and Atna affinities on the other ; the Kolush being truly transitional. The Chesmesyan, the Hailtsa, the Wakash, and the Chinuk, are connected through their miscellaneous affinities, and are all characterized by their harsh phonesis. The Jakon and Kalapuya lead to the languages of the Sahaptin and Shoshoni phonesis—among the congeners of which the sound of *tl* appears and reappears. In the Mexican, this becomes prominent ; and in the Maya, to say the least, has no inordinate prominence.

Between the Rocky Mountains and the Pacific, the Algonkin, with its intrusive character and wide diffusion, has done so much in the way of the displacement and obliteration of such forms of speech as may have shown signs of transition that it is the best-marked class on the continent. Its spread, however, appears to have been from west to east, and the result of it has told most on the fragmentary and isolated languages of the Iroquois family, which it has affected in the way that the Turk and Russian have affected the Ugrian. In its ordinal value, it is, apparently, higher than the Turk, the Mongol, or the Túngus ; lower than the Fin. Taking it along with the Athabaskan and its congeners as far as American Oregon, and with the Eskimo, it probably forms a class to which the Iroquois, the Sioux, the Catawba, the Uche (with its congeners), and (perhaps) the Caddo, form a

co-ordinate. At any rate, the Athabaskan and Algonkin, the Sioux and Iroquois, belong to the same class with one another, and to different ones when compared in mass—whatever the value of those classes may be.

The South Oregon languages graduate into the Californian, and the Californian into those of the Paduca class and those of Sonora; until we come to the two great divisions of the Mexican and Maya; the former of the greater historical importance, the latter important from the multiplicity of its dialects—dialects which simulate separate substantive languages.

The Moqui, a Pueblo language, has decided Paduca affinities.

If the Attakapa seem to be pre-eminently isolated, the vast displacements which have occurred all around may account for it. It has, for an American language, a monosyllabic look. So has the Otomi, which has been compared with the Chinese. So have some of the Athabaskan tongues. So have some of the Algonkin, in certain vocabularies; their congeners, meanwhile, being as polysyllabic as the American languages in general. This leads to the consideration of certain doctrines concerning what is called the general grammatical structure of the languages of the New World; in which, we are told, that they all agree in grammatical, though differing in glossarial, detail. The term expressive of this general character is *polysynthetic*. What is its import?

It is a fact that in an American sentence the term denoting the object coalesces with the verb; so that, while a Roman delivered the equivalent to *I call* in the single word *voco*, the American can, in a single word, say *I call him*, *her*, or *them*, as the case may be.

It is also a fact that there are certain very long words expressive of what in Europe is expressed by short ones, and that out of these long words compounds may be made which are no longer than either of the single elements. This looks as if each were picked

to pieces, and a part alone taken. There is something in each (*à fortiori* in both) of these processes which bears out the term polysynthetic. *Valeat quantum.*

The former process is quite as European as American, and is, to a certain extent, a piece of printer's philology. In *catch 'em*, in *je l'aime*, &c., there is a true incorporation of the objective pronoun with the verb: which, in the Norse, Lithuanic, and other languages, has given us a passive voice developed out of a middle, itself developed out of the amalgamation of the verb with the pronoun. In the Magyar this incorporation has commanded no little attention.

In respect to the other phenomenon—the phenomenon of a composition with a decomposition to precede it—it would be important if proven. The fact, however, of the decomposition is more than doubtful. It is not out of the full-formed pair of primary compounds that the secondary compound is made, but out of the original parts which existed while they—the apparent primary compounds—were merely compounds *in posse.*

Another fact which suggests the term is the incorporation of the personal pronoun with the names of certain parts of the body, as shown in the difficulty there is in getting an American to say *eye* or *head*, &c. purely and simply. He always says *my-eye*, *your-head*, or something of the kind.* But this is Papuan, not to say Kurd and Gipsy, as well.

The same criticism applies to the inclusive and exclusive plurals; which are, by no means, American: nor even Asiatic. The Spanish *nosotros* has already been alluded to.

Still there is polysyntheticism to a certain degree—though much of it is of the grammarian's making. Existing, however, as it does, it may occur in every degree.

* This may be seen in almost any one of the vocabularies, wherein the most cursory inspection tells us that the parts of the human body nearly always begin with either the same syllable or the same letter.

Where the amalgamation is perfect we have such vocabularies as the Iroquois and such paternosters as the Tarasca. Where it is incomplete we have the show of a monosyllabic language.

The doctrine, then, that the differences in grammatical structure are differences of degree rather than of kind, and that there is nothing in one language which, either as a fragment or a rudiment, is not to be found in another, is contravened by nothing from America.

The languages to which those of America are the nearest equivalents in the way of development are, by no means, their nearest congeners in the way of actual affinity. These are the languages of the Papuan and Australian areas ; and, to a certain extent, those of Polynesia. The limited numeration and the concrete view of plurality are points in which they have a decided likeness ; and it is scarcely necessary to add that the culture of the two families is on a like low level.

In North America the phenomena in the way of distribution and diffusion which presented themselves in Asia re-appear ; and in South, there is a re-appearance of the phenomena of North, America. Small areas with a multiplicity of mutually unintelligible forms of speech stand in strong contrast to large ones with a *minimum* of dialectual difference. What the Athabaskan and the Algonkin are in the one peninsula, the Quichua, the Carib, and, above all, the Guarani, are in the other. From the want, however, of details, the direction of the several movements by which they spread is, for the most part, undetermined.

With any South American vocabulary of adequate length, some North American root presents itself—some, indeed, from the extreme north, *e. g.* the Eskimo area. Now, as borrowing is out of the question (whilst the words are not of the sort to be independently excogitated by distant speakers), this, along with the phenomena of transition, is the chief philological argument

in favour of the fundamental unity of the two classes. That the transitions are obscure is, from the scantiness of our *data* for the most important points, what we expect, *à priori.*

When well within South America—for New Granada gives us but few materials—however difficult it may be to give a systematic classification of definitely affiliated languages, it is much more difficult to find a language wherein miscellaneous affinities are wanting. The student from Peru finds Quichua words in every vocabulary he lights upon: whilst the student from Brazil finds Guarani ones. These languages are, certainly, the most widely spread of any: but the same coincidences—allowance being made for the difference in the number of the words compared—occur in all the other tongues; even those of which our knowledge is the slightest.

The details of the classification are given in the preliminary table. The ordinal value, however, of the whole American class requires a brief notice. I doubt whether, on the whole, it is higher than that of the so-called Indo-European in its most restricted form, *i. e.* in the form to which it is limited in the forthcoming chapters of the present work.

However, in order that this statement may not pass for a paradox, it must be remembered that the value of a class depends not upon the number of the minor divisions and sub-divisions which it may contain, but upon the amount of difference between the extremes. If, (the limits of the English, the German, the Russian, the Latin, the French, and their congeners being limited to areas no larger than the county of York,) the remainder of Europe were filled-up with some scores or hundreds of languages, each as different (and not *more* different) from one another as the above-named languages are among themselves, the value of the class at large would be the same; though that of its subordinate sections would be less. Instead of some three primary

divisions with a mass of divisions there would be some scores of genera consisting of either a single species or of few. There would be, in short, a hundred languages resembling the Russian and the German in their difference from each other, but not resembling them in being spoken over large areas. Tested by the difference between its extreme members (say the Eskimo and the Fuegian) the American class, in my mind, is one of a very moderate ordinal value; for, with a view to the *time* required to effect change, a little consideration tells us that the period which will modify one form of speech may just as easily modify a hundred.

CHAPTER LXVI.

The Semitic Languages.—The Phenician and Punic.—The Hebrew and Samaritan.—The Assyrian and Chaldee.—The Syriac.—The Æthiopic and Amharic.—Gafat.—Arabic.—Hururgi, The Amazig or Berber.

THE *Phenician* of Tyre and Sidon and the parts around is known only by inscriptions; and as these are without date the exact state of language which they indicate is uncertain. They are spread over a wide tract of country; a tract which agrees with the notions suggested by the ordinary historical accounts of the commercial and colonial relations of those two cities. They are either rare or non-existent beyond the range of Mount Taurus. They are rare or non-existent along the eastern parts of Africa. They are numerous in Spain, and they have been found in Sicily and Malta. Between those which represent Carthage and those that represent Phenicia the line of demarcation is partly uncertain, partly conventional. Nevertheless, it is convenient to separate, so far as it can be done, the Phenician from the Punic—allied or identical as they may be.

In the way of *language* the Phenician inscriptions are unimportant. In the history of the alphabet they are of interest. It was from Phenicia that the Greeks took their letters: the Old Italians theirs; and from these two all the alphabets of the West have originated. Those of the East (in the mind of the present writer) have, also, a like origin. The proof, however, is less patent.

The Phenician alphabet consisted of signs for the mutes and liquids. Then comes what are considered signs for certain breathings, as *h* and its congeners; along with certain semi-vowels and nasals. In the Phenician itself, and in its immediate eastern descendants, these are treated as consonants—so that the alphabets under the ordinary doctrine are alphabets without *vowels*. If so, such a word as *milk* is written *mlk;* the context being held sufficient to say whether the actual word was *melek*, or *milik*, or *muluk*, or *melik*, or *milek*, or *milk*, or *melk*, or *mlik*, or *mlek*, or what not. Meanwhile, the semi-vowels, in many instances, were vowels also, so that *swl* might stand for *sûl*, or *syl* for *sil*. In like manner the sound of what, as a consonant (or rather as a non-vowel), has been compared with the lene breathing of the Greeks is, in certain cases, represented by the equivalent of *a*.

In the Phenician stage, then, of the alphabet all that can be said of certain letters is that they were occasionally vowels. In the Greek and Latin, however, they became real ones. This is a definite fact. Whatever difficulties we may have in reconciling the powers of certain letters on the Phenician inscriptions with the doctrine that they partook so much of the nature of consonants, and so little of the nature of vowels as to be equivalent to the lene and aspirate breathings of the Greeks (' and ‘), the *semi*-vowels of the English (*y* and *w*), and the nasals of the Portuguese (*a ô*), it is beyond all doubt that in the Greek and Latin they became *α*, *η*, *ε*, and *ο*, all trace of their consonantal power having been lost at an early period. This change, however, they underwent only in their progress westward.

They also underwent another—this, too, in their progress westward. In Phenicia they were written from right to left; in Greece and Italy (after a time) from left to right.

Again—the Phenician alphabet, as far as it is known

to us, is known to us from inscriptions only. Hence, it consists of capital letters only, and these in a form that suits the carver on stone rather than the writer on paper or parchment.

The Phenician of Carthage is conveniently called Punic, and, like the Phenician Proper, it is known through inscriptions. Unlike the Punic it is known by something more than inscriptions. In the *Little Carthaginian* (*Pœnulus*) of Plautus one of the characters is a Carthaginian, who speaks his own Punic.

On the east the Phenician, in the limited sense of the term, came in contact with the Galilean, into which it probably graduated; as the Galilean itself did into the Syrian, the dialects of the country beyond Jordan, and (on the south) the Samaritan. That there was some difference between the Galilean and the Hebrew of Jerusalem we learn from the New Testament: the Galilean being, nevertheless, a Hebrew dialect; indeed, between the Phenician and the Hebrew the difference was political rather than philological. It is the Hebrew into which the Punic of the *Pœnulus* has been more especially transliterated.

Concerning the *Samaritan*, of which the chief original speakers were of the tribe of Ephraim, we know that it wanted the Hebrew sound of either *sh* or *th*; so that *Sibboleth*, *Shibbolet*, or *Sibboleth*, was the Samaritan form of *Shibboleth*.

The Samaritan alphabet was older, and more like the Phenician than the Hebrew. That a copy of the Pentateuch is written in it, that it still exists, and that it gives some important variations from the Hebrew text, is well-known, though its age is uncertain. The remainder of the literature consists in a chronicle and some private letters, written in Arabic with Samaritan characters. In the neighbourhood of Nablûs, fragments of the Samaritans still exist; some others, I believe, in Cairo. It is the Samaritan characters that give the

legends of the Maccabean coins. That the blood in Samaria differs notably from the language, is an inference from the statement in Ezra, that the men and women who returned to Samaria after the removal of the population by Nebuchadnezzar, were (amongst others) Babylonians, Susanites, and Elamites : *i. e.* Assyrians, or Arabs, or Persians, or a mixture.

The *Hebrew* of Judea now follows ; the slight difference between which and the Samaritan is enhanced by the difference of alphabet.

The fundamental date in our criticism of the Hebrew language in respect to its history is the second year of the reign of Darius II., in which were delivered the prophecies of Haggai and Zechariah. Though Malachi, as the last of the prophets, is generally, and perhaps rightly, held to follow these two in time, we have no exact dates for him. On the other hand, those of Haggai and Zechariah (more or less) are precise. Their compositions cannot be older, though they may be later. This coincides with the time of Thucydides, and Aristophanes in Greece, the culmination of the Attic period. The language of these is essentially that of the oldest composition in the New Testament. Such being the case, one of three things is the inference.

1. That the older writings, in their transcription, were accommodated to the newer medium, just as was the case with the older compositions in English, where we have not only differences of dialect, but differences of time as well.

2. That the newer writings were written upon the model of the old, just as Ciceronian Latin is written by late Italians.

3. That the language actually remained unchanged, just as, to some extent, and for some time, and as, compared with certain other languages which changed quickly, the Old Norse of Iceland did. It is unsafe to lay down any general rule for particular cases of this kind. Each

must be tried on its own merits; and it belongs to the great Biblical and Semitic scholars to investigate the one under notice. The question of permanence is one which is, more or less, regulated by circumstances. A language which resists influences for a century may fail to do so for a millennium; or a language, which, with no alterative influences to touch it, may remain unchanged for a century, may, under conditions unfavourable to its permanence, transform itself into something else in a generation or two.

Haggai, then, and Zechariah are *loci standi* for the typical, historical Hebrew of the Jewish Scriptures, with its massive quadrate alphabet, with Jerusalem as its local centre, with the tribes of Benjamin and Judah as its speakers, with Jewish or Hebrew as its name, and with the middle of the fifth century B.C. as its date. It covers everything in the Old Testament with the exception of Ezra and Daniel, and gives us nothing beyond; *i. e.* nothing which exactly coincides with the standard it exhibits.

From the names of the families or tribes in Ezra, some of which are named from the localities which they inhabited before the Captivity, it was the language of Jerusalem and something more—as is to be expected. That it did not all go back to Jerusalem we learn from the subsequent notices of the Jews in various parts of the Persian Empire, not to mention those of Egypt.

That Hebrew was the name for the language of the Holy Land at the time of our Saviour's Crucifixion, we learn from the trilingual inscriptions over the cross—in Greek, in Latin, and in Hebrew: and that the Galilean was a well-marked dialect of it, we learn from the answer of the woman to Peter, whose "speech bewrayed him."—*St. Matthew* xxvi. 73.

In no part of the world do small differences in the way of speech appear greater than they do about Judæa. The ordinal value of the whole Semitic class

itself is of the smallest; but in Judæa and on the Hebrew frontier everything creates distinctions. To differences in nationality and religion differences of alphabet are added; and, out of all these combined, come names like Hebrew, Samaritan, and Phenician—names through which dialects take the guise of languages.

That these complications increase as we proceed we shall soon find. How the Hebrew comported itself to the Syrian on the north, to the forms of speech on the Tigris and Euphrates on the east, and to the Arabic on the south, is a difficult question: for it must be remembered that, over and above the differences of name, alphabet, and nationality, there was a difference of time; the newest Hebrew being older than the oldest Syriac, and much older than the oldest Arabic.

As far, at least, as name went, the *Aramaic* of the time of the kings of Judah was recognized as a different language from the Hebrew, both before the Captivity and afterwards. "Then said Eliakim, Speak, I pray thee, to thy servants in the Aramaic language; for we understand it: and talk not with us in the Jews' language in the ears of the people that are on the wall." "Then Rabshakeh stood and cried with a loud voice in the Jews' language, and spake," &c. (2 Kings xviii. 26, 28.) Then they cried "in the Jews' speech unto the people that were on the walls," &c. (2 Chron. xxxii. 18.) This applies to an address of Rabshakeh, on the part of the King of *Assyria*, who, as speaking to Jews, addressed them in *their* language—not in his. I do not look, however, upon this answer as conclusive to the fact that, on all occasions and under all circumstances, the Syrian was unintelligible to a Jew. All that it tells is, that Eliakim, who understood Syrian, considered that Rabshakeh, who was unnecessarily departing from the use of his own mother tongue, would do well in using, out of two languages, the one which, besides being his own, was less patently

plain to the common people than the one he was using. A latent wish too, to let Rabshakeh know that he (Eliakim) could speak Aramaic is not to be overlooked. All that Eliakim said to Rabshakeh might be said by a Dane who spoke Swedish to a Swede unnecessarily talking Danish, or by a Portuguese to a Spaniard under similar circumstances. This means, that I do not look upon the passage as conclusive to the Aramaic and the Judæan having been mutually unintelligible languages; which I think they were not.

In thus calling these two forms of speech *Judaic* and *Aramaic* I give the original terms of the Jews themselves. The Greek, Latin, and ordinary equivalent of Aramaic is *Syrian*. Here it applies to the *A*ssyrian, *i. e.* the language of the subjects of Sennacherib rather than those of Benhadad.

In Ezra we find a similar distinction, the date being the time of Artaxerxes; when the notification that the re-constitution of Jerusalem was going on, and that it ought to be stopped, is written in Aramaic; as were other documents appertaining to the administration of Judea. But too much stress must not be laid on this; inasmuch as a slight difference between the languages would be enhanced by the difference between the alphabets.

In Daniel we get a new term, and it is because this name is an important one; an obscure one; one which, from its ambiguity, has created no little confusion; and one of which the history is mixed up with that of the Aramaic and Jewish, that the preceding *minutiæ* have been indulged in. Along with Shadrach, Meshach, and Abednego, Daniel is brought up under the master of the eunuchs to be taught "the learning and the tongue of the *Chasdim* (*Chaldees*)." Elsewhere the Chasdim and Arameans (Chaldees and Syrians or Assyrians) are associated. Now, it is only in the latter half of the book of Daniel, and only when the kingdom of which Babylon was the capital is con-

trasted with that of the Medes and Persians, that *Chasdim* is a national name. In the earlier chapters, and when the contrast is between the Babylonians and Jews, it means *astrologer*.

The Aramaic that was spoken by Rabshakeh was the language of *A*ssyria rather than Syria. It was also the language of Nineveh rather than Babylon. The Aramaic of Ezra and the earlier chapters of Daniel was also *A*ssyrian rather than Syrian; but it was the Assyrian of Babylon rather than Nineveh.

It is from the Assyrian of Babylon that *Chaldee*, as a name of the later Hebrew, is taken, and it is from Nineveh that we get *Caldani*, as a name of the existing Christians of the parts about Urumiah.

Of the true *Syriac* of Damascus, Emesa, and Edessa, the literary history begins no earlier than the fourth century.

It is Christian. It is embodied in an alphabet which, though it agrees with the Hebrew in the number, order, and names of its letters, differs from it in the form of them: the language itself being in contact with the Greek and encroached upon by it. If it were really spoken in Cappadocia it was the most northern dialect of its class. The Palmyrene, known only by inscriptions of the third century, is either a peculiar alphabet or the ordinary alphabet adapted to lapidary purposes.

In the third century, as now, Irak and Khuzistan were districts in which the Persian and the Arab populations came in contact; and in the third century (and even earlier) the Syrian language was widely current in both Arsacidan and Sassanian Persia. In his life of Antony, Plutarch tells us how Mithridates, a cousin of Moneses, asked for some one who could communicate with him in either Parthian or Syrian. In the seventh century a Syrian abstract of Aristotle's Dialectic is said to have been made for Chosroes Nushirvan. More than

this, the geographical details of the Semitic tribes of south-western Persia are known. The particular population which occupied Khuzistan and Irak was that of the Nabatheans; so-called by both the Arabian and Persian historians; though the name has a wide as well as a limited signification. Masudi writes that Ardeshir Babegan besieged a Nabathean king in Sevad. The date, however, is too early for this to pass as actual history. Tabari, however, states that "at this present time the Nabatheans who dwell in Sewad are descended from the Arameans."

That these Nabatheans were of the rudest is likely enough; indeed, it is specially stated that such was the case. Nevertheless, they could mix up their language with that of the traders, the soldiers, and the common people as well as more learned men. Meanwhile but a little beyond them was the alphabet, the literature, and the civilization of Palmyra—largely Greek; but, at the same time, Semitic as well. It is to the Palmyrene that the lapidary Sassanian most closely approaches.

It is not for nothing that I have gone into these details. With the multiplicity of names and alphabets, the differences between the languages under notice have been exaggerated. Let any one who doubts about their being essentially dialects of a single language prepare himself for the investigation by a due valuation of the extreme differences between the different dialects of Germany, France, or Italy. If he come to the conclusion that such an examination proves too much, and that the result of it is a splitting up of several French, Italian, and German dialects into so many separate substantive languages, I have nothing to say against his conclusion. I have only to ask him to suppose the Arabic, the Syriac, and Hebrew all written in the same alphabet, and compared with one another in the same stage. Unless this be done, differences will be exaggerated and names will mislead.

If this uniformity be admitted, the conclusion must give the comparative recent diffusion of the forms of speech in which it appears—either this or a great indisposition to change. Of the two alternatives, the former is the more likely, though I do not press it as the only one.

The direction in which the stream of language moved is obscure; all that can be said is, that there are none of the languages on the Asiatic side of the Red Sea into which they graduate. The converse is the case in Africa. This induces me to leave the Arabic for the present, and to begin at the other side of the Semitic area, and, having first considered the extremes, to proceed to the consideration of the middle ground.

The *Gheez* is the language of the earliest Æthiopic translation of the canonical Scriptures, of more than one apocryphal portion of them, and of a few writings on ecclesiastical subjects. It is read, at the present time, in the churches, in the way that the Latin is read in the Roman Catholic countries, and the Old Slavonic in Russia. Its alphabet is syllabic, and the writing runs from left to right, and not from right to left, as is the case with the Hebrew, Syriac, and Arabic. The details of its origin we cannot give, nor name its immediate prototype.

Of the descendants of the Gheez, the nearest is that of the present province of Tigré; indeed, the *Tigré* is generally looked upon as modern Gheez, the Gheez as ancient Tigré—the Tigré being a written language; its alphabet, the Gheez with modifications. Of its dialects and sub-dialects we know nothing. The parts about the ancient city of Axum are the probable localities of these two varieties of the Æthiopic.

Gondar, on the other hand, and the southern provinces of Abyssinia, give the *Amharic* area: the Amharic language being spoken at the present time by the majority of the southern Abyssinians; and being written in an alphabet of Gheez origin.

The *Gafat* lies in contact with the Amharic and Agaw

on the north, and the Galla on the south; by both of which it has been encroached on—by the former first, by the latter recently: indeed, the Galla encroachment is still going on. Bruce has given a specimen of it, so has Dr. Beke: who remarks that his own vocabulary is more Amharic than his predecessor's.

It is into the Amharic that Dr. Beke believes that the Gafat is gradually merging. The special Gafat locality is

a small district in the south of Damot. It apparently falls into dialects, or sub-dialects; since the language of Dr. Beke's informants varied according to the district from which it came. Some gave to almost every word the termination *-ish*; others *-oa*; others no addition at all. The former of these affixes is truly Gafat: the latter is Agaw as well.

The alphabet of the present Arabic is closely akin to that of the Syriac; from an early form of which, the Cufic, it seems to have been derived. But the Arabic of the Koran is not the oldest language of which we find memorials in Arabia. Neither does it give us the only Arabic dialect. Certain valleys in the south-east abound in inscriptions to which the name Himyaritic has been applied. The alphabet of these is the Æthiopic, which differs from all the other Semitic alphabets in being not only written from right to left, but in being syllabic. Whether this give us a new language in the strictest sense of the term is uncertain. It is certain that it gives us as much of one as is given by the Phenician, or even the Syriac. At any rate, it gives us a dialect of the south-east rather than one of the parts about Mecca; a dialect of the fourth century, rather than one of the seventh; and, finally, a dialect which, in its literary aspect, at least, connects Arabia with Æthiopia.

In favour of Æthiopic elements thus introduced upon the cognate Arabic, the Himyaritic inscriptions only give us a presumption. Arabic elements, however, in Africa are important realities. That the present language of Ægypt, Barbary, and large tracts elsewhere, is Arabic is well-known. In all these cases, however, the analysis is, comparatively, easy—the mixture being heterogeneous. Arabic, however, introduced into Æthiopia would be like Dutch introduced into England; in which case it would, with certain words, be hard to say to which language they belonged. Even if the language were, for all practical purposes, Dutch, there might still be a basis in the older tongue.

Mutatis mutandis, this applies to several forms of speech on the Æthiopic frontier—in all of which analysis is required ; in all of which, amid much which is Semitic, there is something that is Æthiopic rather than Arabic. When the Arabic has overlaid two languages instead of one the analysis becomes more intricate.

The languages of Hurur and Adaiel are of this kind.

We now return to the Hebrew and Syriac in the newer forms. The language of the Talmud, written in a modification of the Hebrew alphabet, represents the language of the Jews after the destruction of Jerusalem. It has largely influenced the Hebrew of common life in conjunction with other causes; so much so that it may be doubted whether this latter be a true vernacular; by which I mean, that is it to be compared with Latin as spoken by a mass of individuals who have learned it either directly or indirectly through books rather than with the Italian or Spanish which have developed themselves freely and spontaneously. In all languages the continual reference to written works developes an artificial element. In the modern Jewish this is believed to be considerable. It is a matter, however, upon which no one but a learned and critical Jew can speak with confidence.

The same applies, in a still greater degree, to the fragmentary Samaritan.

The same, too, to the modern Syriac. It is said to be spoken by a few individuals in the Lebanon. It would, perhaps, be better to say that there are some individuals in the Lebanon who can speak it.

Further north, the evidence of either it or an allied dialect being a true vernacular improves; it being specifically stated that most of the Nestorians, though they use their own language in intercourse with each other, are able to speak the so-called Tartar of the Turks around them with ease and fluency. Very few, however, have any tincture of literature; their MSS. being scarce, and printed works, up to A.D. 1829, non-existent. In that year, however, the Gospels were printed from a copy, obtained from Bishop Mar Johannan, through Dr. Wolff, by the British and Foreign Bible Society. In 1840, the American missionaries introduced a printing-press; so that, over and above some important translations from the Scriptures, a series of tracts, from the Dairyman's Daughter to Dr. Watts's hymns, has been published. In

thus adapting an ancient language to the spiritual wants of a poor and illiterate community of oppressed Christians, the names Perkins, Halliday, Grant and Stoddart, to the preface of whose grammar of the Modern Syrian the foregoing facts are due, are honourably conspicuous. The schools of the mission have gradually increased in number, and in 1853 they amounted to eighty.

We can scarcely consider either the modern Syriac or the modern Hebrew as a true spontaneous development of the old language. Literary influence has engendered an artificial element in them; and the fact of every community where either is spoken using a second language has taken them out of conditions under which true philological growth proceeds. What they *do* illustrate is, the laws by which such forces as the ones just noticed act—and, in this respect, they deserve all the attention that has been awarded them.

Even the Arabic is scarcely a language that has been left to its own natural growth. Except in the ruder dialects of Arabia itself, of which we know little or nothing, the Koran has always exercised a conservative influence; whilst, in Malta, where there is no Koran, there is a second language.

* * * * * *

The *Amazig* (or Berber) area is the largest in Africa, extending from the confines of Egypt to the Atlantic Ocean. More than this—the Canary Islands, until the extermination or fusion of their aborigines, were Amazig.

Again—the ancient Mauritanians and Gætulians were not only the occupants of the Amazig area, but of Amazig blood. Of Amazig blood were the native tribes with which the Greeks of the Cyrenaica came in contact. Of Amazig blood were the native tribes with which the Phenicians of Utica and Carthage came in contact. The subjects of Masinissa and Jugurtha occupied localities of which the ancient names are explained by means of the modern Amazig.

At the present time there are five names for five divisions of the Amazig populations, and seven names for the Amazig forms of speech. How far either series is natural is another question.

(1.) The *Kabails*—who speak the Kabail language, are the Amazig of the northern part of Algiers rather than Morocco.

(2.) The *Showiah* are the Amazig of Morocco rather than Algiers. They occupy, however, some of the central districts of Algiers; their language being the Showiah.

(3.) The *Shiluk* lie to the south of Morocco, their language being the Shiluk.

(4.) The *Berbers* belong to the south-eastern parts of Algiers, to Tunis, to Tripoli, and the corresponding

parts of the Sahara. Their dialects are the *Larua* and *Zenaitia.*

The extent to which the few fragments of the Lancerotta and Fuerteventura dialects of the Canary Islands agree with the Shelluh may be seen from the following table :—

English.	Canary.	Shellub.
Barley	temasin	tumzeen
Sticks	tezzezes	tezezerat
Palm-tree	taginaste	taginast
Petticoat	tahuyan	tahuyat
Water	ahemon	amen
Priest	faycag	faquair
God	acoran	mkoorn
Temple	almogaren	talmogaren
House	tamoyanteen	tigameen
Hog	tawaeen	tamouren
Green fig	archormase	akermuse
Sky	tigot	tigot
Mountain	thener	athraar
Valley	adeyhaman	douwaman.

The Canary Islanders were called Guances, and their language the Guanch.

CHAPTER LXVII.

The Agau, Agaw, or Agow, and Falasha.—The Gonga dialects.—The Kekuafi.

Agaumidr = Agau-land, and one of the vocabularies of Dr. Beke, is headed *Agau of Agaumidr:* a name which suggests the notion that one part of the Agau area was more decidedly Agau than the remainder. And this seems to have been the case; since *Agaw* is either an Amharic or a Gheez term; *Aghagha* being the native name.

English.	Waag.	Faslaha.	Agaumidr.
Man (homo)	egir	ira	aghi
—— *(vir)*	gelua	garwa	ngardzhi

Seven	langata	langatta	langatta
Eight	sohota	saghotta	saghatta
Nine	tsaicha	sessa	sesta
Ten	tsikka	chikka	tsikka.

The *Agaw* is bounded on the east, north, and north-east by the Tigré; being spoke in the province of Lasta, and along the banks of the Tacazze. The particular dialect of the district named Waag is called Hhamara—which, word for word, seems to be Χαμάρα and Amhara; the former term being as old as the time of Agatharchides, who uses the expression Χαμάρα λέξις for one of the languages of these parts. In the southern parts of Lasta, the Agaws are genuine mountaineers. In Waag, and along the Tacazze, the land lies somewhat lower. As a general rule, however, the Agau districts lie in the more impracticable parts of Abyssinia, and the dialects, *pro tanto*, take the appearance of aboriginal forms of speech. The Agaws of Waag are the Tsherats Agaws of Bruce.

Gonga is a name found in Ludolf: who places the tribes to which he applies it in the Bahr-el-Abiad, about 10° N. L. Dr. Beke has supplied as vocabularies for the forms of speech referable to this class; (1.)

the Kaffa; (2.) the Woraita; (3.) the Wolaitsa; (4.) the Yangaro. Word for word, I imagine that *Yangaro* is *Zinzero* or *Gingero*, a name which in the old maps denotes one of the most southern provinces of Abyssinia. To this district belongs Enarea, believed to have been once a Christian kingdom. Now, however, it is overrun by the Galla.

The name Gonga is native. In the western parts of the valley of Bahr-el-Abiad, visited by Dr. Beke, and named in the native dialect *Shinasha*, in Agáwi, *Tsintsi*, in Amharic and Gafat *Shinasha*, and converted by the Portuguese into *Chinchon*, the natives believe that, before the invasion of the Gallas, their country was both populous and powerful, and their language was spoken far, to both the south, and the west. They also apply the name *Gonga* to a large tract of country to the south.

English.	Gonga.	Kaffa.	Woratta.	Yangaro.
Man (*homo*)	aso	——	asso	assu
—— (*vir*)	lugsho	——	atuma	gunagúsha

Eight	seminta	shiminta	hospona	nangiri
Nine	dzheta	yidea	hodúpona	izgin
Ten	tacha	ashiri	tama	assir.

Word for word, *Kekuafi* is Eloikob. Let us see how this can be. Eloikob is the native name: the name which certain tribes of the part of Africa now under notice give themselves. Their neighbours, the Wakamba, who lie between them and the coast, and from whom the term has been taken, change it into *Akabi*, for the singular, and *Mukabi*, for the plural, number. A further change converts it into *Mkuafi*, and *Wakuafi*. The Eloikob, or Kekuafi, area, lies, then, in contact with that of the Wakamba

English.	Ukuafi.	English.	Ukuafi.

CHAPTER LXVIII.

The Coptic.—The Bishari.—The Nubian Languages.—The Shilluk, Denka, &c.—The Mobba and Darrunga.—The Galla Group.—The Dizzela, Dalla, Shankali or Shangalla.

THE language of Ægypt in its oldest form is that of the oldest hieroglyphic inscriptions. Upon the details of the interpretation of the hieroglyphics themselves I can form no independent opinion. I can only remark that the strictest test of a deciphered cypher, viz. that of enabling the master of it to apply it according to the rules of its decipherers and to obtain a result of literal and self-apparent accuracy, is one which in the existing transliterations is not come up to. If otherwise, why have we not a series of old Ægyptian texts in the ordinary Coptic alphabet, of which an ordinary Coptic student could judge?

The language in its newer form is written in an alphabet derived from the Greek, and embodies an early translation of the New Testament, parts of the Old, and several ecclesiastical compositions. It falls into three dialects: the Sahitic, or Thebaic, of Upper, the Memphitic of Middle, Ægypt, and the Bashmuric of the Delta; all giving a considerable mixture of Greek words: which, in the Bashmuric, are the most numerous.

As a true vernacular it is extinct; at least, though I have heard of its being still spoken, I have not succeeded in finding the details of the evidence. Neither would the mere fact of its being spoken make it a true verna-

cular. It might be spoken merely as any other literary language might be used in conversation. It is the Arabic that has superseded it; in the case of which language the difference, in Ægypt, between the blood and the speech is considerable.

In structure the Coptic is more simply agglutinate than the full Semitic tongues, with which it chiefly agrees in the personal and possessive pronouns. It is often (perhaps generally) treated as Sub-semitic; though in the application of this name ethnographical reasons have, either consciously or unconsciously, been mixed up with philological ones. That it is, to some extent, Semitic is true; but it is inconsistent to make it this to the exclusion of other languages that are more so. It will be noticed again in the sequel when a language from a very different quarter—the Basque—comes under notice.

It is the valley of the Nile which gives us Egypt; the plateaux and hills between the river and the Red Sea being other than Egyptian. This is what they are now. This is what they seem to have been at the beginning of the historical period. That the Arabic prevails largely in these districts is well-known: indeed, in the northern half it prevails exclusively. The blood, however, is less Arab than the language: while the language itself, as we proceed southwards, becomes other than Arabic. In the parts about Kosseir, the *Bishari*, or *Beja*, is spoken; the Bishari tribes being the conquerors of the Ababde; the Ababde being Bishari, and the Bishari Ababde, with this difference—the Bishari speak their own language, the Ababde have exchanged it for the Arabic. Such, at least, is the common statement; the presumptions being in favour of it. At the same time the evidence is capable of improvement. That the Ababde are other than Arabs is shown by their colour and by the texture of their hair. They may, however, have been other than Arab, and yet not, necessarily, Bishari. The presumptions, however, as aforesaid, are in

favour of the common doctrine. The Ababde lie nearer to the Nile; the Bishari to the sea. Both extend into Nubia; both into Egypt.

The country about Suakin is the occupancy of the Adareb, of whose language, *eo nomine*, I have seen no specimen. A *Suakin* vocabulary, however, *eo nomine*, is Bishari.

No Bishari compositions are known; nor is it known that the Arabic alphabet has been applied to the language —though the tribes that speak it are, with few or no exceptions, real or nominal Mahometans. For the Hadendoa and Hallenga languages, vocabularies, *iis nominibus*, are wanted. They are spoken between the Mareb and the Tacazze; the few words known as *Taka* or *Boje* (? *Beja*) probably represent them.

In language, as well as in physical form, and in geographical position, the nearest neighbours to the Bishari are the *Nubians*.

Nubia begins where Egypt ends, *i. e.* at Assuan, or Syene; and where Nubia begins a new language presents itself. We may call it *Nubian*: subject to the necessity of remembering that the term has a wide and a restricted sense. There is the name of the class and there is the name of a special dialect.

The Nubian class falls into two divisions of uncertain value; (1.) the *Nubian Proper*, (2.) the *Koldagi*.

The Nubian Proper is spoken along the Nile, from Egypt to Sennaar; falling into three dialects, (1.) the *Kensy* of Kenúz on the north, (2.) the *Noub*, or Nubian, in the limited sense of the word, in the middle districts, and (3.) the *Dongolawy* of Dongola. The Nubians are also called Berbers, Berberins, or Barabbra; a term which, from being applied to the Amazig tribes, has occasionally created confusion. It is the Nubians, however, to whom it applies with the least impropriety.

One of the numerous languages of Kordovan is named the *Koldagi*, and I believe that it is the language of the

capital. It is, however, only one form of speech out of many. Like the Nubian, it is known through vocabularies only. Like the Nubian, it is the language of a rude and imperfectly Mahometan population. Its Nubian affinities were pointed out by Rüppell.

To the south of Obeyd, the capital of Kordovan, the geography is obscure. In Africa, however, we may often procure specimens of a language where we fail in finding the place where it is spoken. This is because it is the land of slavery; and because residents in any of the great centres of the traffic may generally find representatives of even very distant languages. The vocabularies may be relied on; because when a man says that such

or such a word means *horse*, *man*, and whatever else it may be, he is to be believed. Their geography, however, is to be criticized; because when we hear that such or such a place lies so many miles west of so and so, the likelihood of error, both in respect to distance and in respect to the points of the compass, is considerable.

I find it difficult to say where Kordovan ends and Sennaar begins. Sennaar, pre-eminently an African—not to say a Negro—country, is also the occupancy of the Sheyga Arabs; and where Arabic is the current language, the indigenous dialects stand a fair chance of being neglected. Such is the case with Sennaar. Of non-Arab vocabularies brought from Sennaar, in the limited sense of the term, I know none. All I know is certain vocabularies brought from certain frontier districts, which may reasonably be believed to belong to Sennaar forms of speech. The proportion that the *indigenæ* bear to the Arabs is unknown. The chief native population, however, is called Funge. But who has ever seen a specimen of the Funge, *eo nomine ?*

That some, however, of the languages spoken to the south of Obeyd represent the Funge is probable. Of these we have samples in Rüppell, and others. Thus—

The *Shabun* is said to be spoken to the south of both the Kordovan and the Sennaar frontiers. It is not *very* closely allied to anything. It is nearest, however, to the *Fertit*—the most southern of the languages of Rüppell.

The *Shilluk*, whose name, from the fact of its appearing elsewhere, I imagine to be Arab rather than native, lie on the Bahr el Abiad, and, like the Denka, their frontagers, are Pagans.

The *Fazoglo* language is the same as the Qamamyl of Caillaud, and—less like the Shilluk than is the Denka—apparently belongs to the same class; that class being one of small dimensions.

There is an imperfect Mahometanism in Darfur, the country of the *Furian* language; of which only one

language (probably one out of many) is known by vocabularies.

The *Mobba, Maba,* or *Bóra Mábang* is the language of Waday Proper, and the chief tongue of Darsaleh : being understood by many populations to whom it is not vernacular. It is known by a few specimens in the *Mithridates*, and by a longer vocabulary of Burchardt's. Barth, too, has collected more than two thousand words of it, along with some phrases and a translation of the Lord's Prayer, a part only of which is published. The tribes who speak it are—

1. The Kelingen.	7. Kumo.	13. Bili.
2. Kajanga.	8. Jambo.	14. Bilting.
3. Malánga.	9. Abùe Gedam.	15. Ain Gamara.
4. Madaba.	10. Ogodongda.	16. Koromboy.
5. Madala.	11. Kawak.	17. Girri.
6. Kodoyi.	12. Ashkiting.	18. Sheferi.

Mararit and *Menagon* are the names of two tribes of the Abu Sharib, who are specially stated to speak the same language—a language in which Barth has collected, but not published, about 200 words, along with a trans-

lation of the Lord's Prayer. The Tama speak an allied dialect. As for the remainder of the group, it is said to consist of numerous tribes whose dialects differ so much, that one can scarcely understand the other without recourse to the Mobba. The *Mimi* are said to speak a peculiar language, so are the *Kaudard:* as also the *Koringa*, about 17° N. L.

Fire	nissiek	*Ten*	bûf.

The Bishari (for it is to them that we must now return) are succeeded by the most northern members of the great *Galla* class.

Next to the Caffre and Berber this is the largest of all the African groups. It is also a complete one; at any rate, it falls into three well-marked divisions: (1.) the *Danakil;* (2.) the *Somauli;* (3.) the Ilmormo, or

Galla Proper. It has a vast *known* extent from north to south. It has a vast *unknown* extent from east to west. It has an irregular outline, being deeply indented by the languages of the Abyssinian class; or, rather, it, itself, cuts deeply and irregularly into Abyssinia—for the Galla tribes have long encroached upon the southern provinces of that empire; and much that was once Semitic is now Galla. Bounded on the north by the Bishari and Nubian, and on the east by the sea, it is limited by the Tigré, Amharic, and other languages in the north-west. South, however, of the latitude which coincides with the southern boundary of Abyssinia, it extends indefinitely inland. In the parts about Hurur the Semitic forms of speech protrude themselves largely and irregularly. To the south-east it comes in contact with the northernmost members of the Kaffir family: the boundary lying near, but not on, the Equator. The Ukuafi seem to touch it on the interior.

The Galla population is pastoral rather than agricultural, and African rather than either Negro or Arab in physiognomy; *i. e.* the colour is more brown than black, the features more prominent than depressed, the hair long and twisted, rather than woolly. Paganism is still rife amongst the southern, or pure Galla (or Ilmorma) tribes: an imperfect Mahometanism is adopted by the Danakil. Fragments of an early Christianity—Abyssinian in its origin—are believed to be discoverable. The language is known both by grammars and vocabularies. It is unwritten; *i. e.* there is no native alphabet, and no application of the Arabic.

The *Danakil* call themselves *Afer*, and it is not improbable that the term *Africa* comes from them. The Egyptians may have diffused it. *Danakil* itself is, like so many others, a word strange to the language to which it applies. I cannot but think that, word for word, it is *Dongola*, yet the Dongolawy are Nubians. Probably, some third population gave them both the same name.

The Danakil begins between Suakin and Arkiko, and extends from the Red Sea to the frontiers of Abyssynia.

The *Somauli* area begins near the straits of Babel-mandel, and runs southward and inland; Berbera, the great slave mart being the chief Somauli town: the Somauli tribes, too, being the occupants of the parts about the Semitic town of Hurur.

The *Galla Proper*, or *Ilmormo*, belong to the interior rather than the coast, their area being one of great, but unknown magnitude, with a sinuous outline, and an encroaching frontier. Sometimes this encroachment is effected at the expense of the Danakil: sometimes (perhaps oftener) at that of the Abyssinians. The former, for instance, has given way before the Asubu, the latter before the Edjow, tribes. The kingdoms of Shoa and Efat are, now, more Galla than Abyssinian. The town of Ankober is a Galla capital: though mixed in respect to its population. No tribe in Africa has the discredit of being ruder and more savage in its warfare than the Gallas. Their physical appearance is that of the Bishari rather than the Negro.

Water	aya	ahu—*Agaw*
Rain	dema	———
Cloud	———	dimna—*Agaw*
Smoke	tukwa	tikki—*Tigré*
Clay	tukwa	dhoke—*Galla*
Tree	mugha	muka—*do.*
Shade	gisa	chiso—*Gonga*
Spring	aimusa	mincha—*Agaw*
Market	gabea	gebaia—*Galla*
Bridle	sugha	lughwam—*Agawi*
Whip	jilanda	halinga—*do.*
Mouth	sima	*simota*—*Gafat*
Tooth	kussa	gasso—*Gonga*
Rainy season	chiña	gana—*Galla.*

In Salt, the Dalla and Dizzela, like the language represented by the third vocabulary, are given as Shangalla. They are all spoken by Negroes rather than true Abyssinians.

CHAPTER LXIX.

The Kaffir Class of Languages.

WITHIN a degree or two of the Equator the Galla and Ukuafi are succeeded by that large class of languages, which those who have no dislike to double names call *South African*, whilst others, who have no objection to using a word in a general as well as a particular sense, call *Kaffre* or *Kaffir;* a word which is both the name of a class and the name of a particular division.

On the western coast the languages of this group appear *north* of the Equator, and, with the exception of the Hottentot area, they cover all the intervening space.

Their peculiarities of grammar have been carefully studied and illustrated.

(1.) If a new word be introduced into the language of the Amakosa Kaffres, it takes an inseparable prefix before it can become naturalized. *Priest*, for instance, becomes *um*-priest; *Pharisee*, *Um*-pharisee. In the words *um*-tu = *person;* *i*-hashe = *horse;* *in*-kosi = *captain;* isi-*caca* = *servant;* *u*-sana = *infant;* *um*-lambo = *river;* *u*-buso = *face;* *aku*-tya = *force;* *aba*-ntu = *people;* *ama*-zwe = *words;* *in*-komo = *cattle;* *imi*-ti = *trees*, &c., the syllables in Italics are wholly foreign to the root. Adventitious, however, as they are, the system of prefixing them is general.

(2.) When two words come into certain syntactic relations, one of them changes its initial letter according to that of the other, just as if, in English, we said, for

sunbeam or *white man*, *bunbeam* (or *sunseam*) for *whiteman* (or *miteman*).

(3.) The prefix, however, is part of the word; whence it follows that, for the purposes of determining the change which one word, in these syntactic relations, impresses on another, we must look to the initial letter (or letters) of the prefix rather than to those of the words to which it is united. A word (no matter how it begins) takes *um* as its prefix; the rule being that when one word begins with *um* the other begins with *w*. The Kaffre for a *man of the people* is *um*-tu *wa*-bantu, whereas a *captain of the people* is *in*-kosi *ya*-bantu.

In this way the System of Prefixes and the System of Alliteration, in the Amakosa Kaffre at least, are connected.

That facts of this kind should tell upon the phraseology of the grammarian is only natural. They give him his declensions; for it is clear that according to the nature of the prefix we may arrange the nouns to which they are united into classes. Doing this, we may talk of the Classification of Nouns, just as Latin scholars talk of the Declensions.

Again—the form of the Plural is often determined by the prefix. Thus, in Bakeli:—

First Declension.

SINGULAR.	PLURAL.
a-vata=*chest*	*bi*-vata=chests
a-bobi=*hat*	*bi*-bobi=*hats*
i-eli=*tree*	*je*-li=*trees.*

Second Declension.

SINGULAR.	PLURAL.
di-kaki=*stone*	*ma*-kaki=*stones*
di-eki=*law*	*m*-eki=*laws.*

And so on for seven other classes or declensions; the number of classes in the Bakeli being nine. In other languages, however, they are more numerous; *e. g.* in the Herreo they are eighteen.

The origin of these prefixes is another question. They are noticed here for the sake of ascertaining their value as characteristics.

The forms of speech which immediately underlie the Galla and Ukuafi are the following—belonging to the inland districts rather than to the coast. On the coast the language is the Suaheli, Suwaheli, or Sohili, containing numerous Arabic elements and partaking of the nature of a Lingua Franca.

English.	Wanika.	Wakamba.	Msambara.	Sohili.
Man	muta	muntu	mgossi	mtu
Woman	mtsheta	muka	mdere	mtunke
Head	dzitzoa	mutue	mtoe	kitoa
Eye	dzityo	ido	yisso	dshito
Nose	puła	embola	pum	pua
Tongue	lammi	uimi	uraka	ulimi
Tooth	dzino	ino	zino	dzhino
Ear	sikiro	idu	gutui	shikio
Hand	mukono	mukono	mukono	makono
Foot	gulu	mudumu	emrondi	gu
Sun	dzua	kua	zua	dzhua
Moon	muesi	moi	muesi	muesi
Star	nioha	nioa	niniesi	niota
Fire	muotto	muagi	muotto	muotto
Water	madyi	mandzi	mazi	madzhi
Stone	dziwe	dziwe	ziwe	dzhiwe
Tree	muhi	mutte	muti	mti
One	emmenga	umue	mosi	emmodsha
Two	embiri	ili	kaidi	embili
Three	tahu	itatu	katatu	tatu
Four	enne	inna	kanna	enne
Five	tyano	idano	kashano	tano
Six	tandaho	dandatu	ententatu	setta
Seven	fungahe	mama	fungate	sabaa
Eight	nane	munda	nane	nani
Nine	kenda	kenda	kenda	kenda
Ten	kumi	kumi	kumi	kumu.

The Makua extends, at least, as far as Quilimani.

The Monjú, Muntu, or Makoa, is spoken to the back of the Mozambik coast; of which the Maravi of Kölle's Polyglotta is, perhaps, the most inland dialect. In Inhambane, where Portuguese influences succeed to Arabic,

such differences as exist are, probably, political rather than philological. At any rate, the dialects seem to graduate into each other. South of Inhambane and Sofala begins the Kaffraria of the British and Dutch frontiers with, *iis nominibus*, the Zulu, the Kaffre Proper, and the Bechuana as important and well-illustrated languages—the last in contact with the Hottentot; to the north of which the Heriro, a true Kaffir tongue, appears in the parts about Walwisch Bay. To this, on the north, succeed the Benguela, the Angola, the Congo, and, on the Equator, the Rungo, or Orungo, of the Gabún. For the parts about Corisco Bay, we have evidence that the language is essentially the same; whilst for Fernando Po and the Cameroons we have abundant details—the languages being the Ediya of Fernando Po and the Isubu and Dualla (little more than dialects) of the Cameroons.

At the head waters of the Gabún lie the districts of the Bakele, estimated by the missionaries at about 100,000—lighter coloured than the tribes between them and the sea; darker than those of the mountains behind them. Compared (as it is by either the author or the editor of the grammar) with the *Mpongwe* of the Gabún it differs very materially; the verbal resemblances being about one in ten. The present list, however, makes them more.

English.	Mpongwe.	Bakele.
Man	kadia	makalie
Woman	owanto	miali
Child	onwana	mana
——	erumbe	ndenbishili
White man	otangani	ntanga
Head	ewonjo	langaka
Hair	orue	lashoi

Fill	jonia	lonisha
Speak	kamba	lubila
Drink	jonga	nata
Run	pula	punda
Die	juwa	shasha
Boil	benla	taka
Kiss	samba	viba.

The following are miscellaneous illustrations of the languages on the north-western portion of the Kaffir area.

(*From the Polyglotta Africana.*)

English	*Man*	*Woman*	*Head*
Kisama	diala	muhata	muntue
Songo	diala	mehetu	mutue
Runda	ekiunds	mbant	umodsh
Lubalo	diyala	muhetu	muntue

English	*Man*	*Woman*	*Head*
Basunde	bakala	kento	tu
Nyombe	iyakala	nkelo	ntu
Kasange	diala	muketu	motue
Bumbete	balera	okasu	modsue
Babuma	balga	mokas	modsue
Mutsaya	lebalaka	mukeat	motsue
Ntere	bara	mokas	motsue
Kanyika	muanumulon	muanumekas	motu
Mbamba	balera	okas	otue
Musentando	yakala	kento	ntu.

English	*Nose*	*Eye*	*Ear*
Kisama	dizolu	diso	ditue
Songo	dizunu	liso	litu
Runda	mushor	liz	didsh
Lubalo	lizulo	liso	litue
Basunde	mbombo	odiz	kutu
Nyombe	dizulu	liso	kutu
Kasange	dizolu	aso	kutue
Bumbete	yolo	odisu	ledsue
Babuma	yulo	dsis	dsue
Mutsaya	yul	dsiz	dsui
Ntere	yilo	dsis	dsue
Kanyika	muol	diz	ditu
Mbamba	yolo	diz	tue
Musentando	luzunu	dizu	kutu.

English	*Mouth*	*Tooth*	*Tongue*
Kisama	dikanu	diso	demi
Songo	ndikanon	lizo	lemi
Runda	mulam	dizeu	ardim
Lubalo	likano	lizo	limi
Basunde	noa	dinu	ludimi
Nyombe	monu	dieno	ludimi
Kasange	kanua	lizu	limi
Bumbete	moyu	dinu	ukumonyue
Babuma	monyua	dsino	lelim
Mutsaya	monyua	dseni	lilim
Ntere	monyua	dsina	limi
Kanyika	mosuk	din	ludim
Mbamba	onyun	dini	lelemi
Musentando	nua	dinu	ludimi.

English	*Fire*	*Water*	*Sun*
Kisama	tuwia	menya	de kombi
Songo	tubia	menya	moanya
Runda	kash	menyi	muten

English	*Fire*	*Water*	*Sun*
Lubalo	tibia	mema	moanya
Basunde	mbazu	nlangu	muini
Nyombe	mbazu	nlangu	tangu
Kasange	tubia	meya	likombi
Bumbete	mba	andsa	ntangu
Babuma	mbaa	madsa	mi
Mutsaya	mba	madsa	mui
Ntere	mba	madsa	tari
Kanyika	mudil	moaz	munyenyi
Mbamba	mba	andsa	nyango
Musentando	tiwia	maza	tango.

To these add the numerals of the *Fan*, of which so much is made in Mr. Du Chaillu's work. They belong to the same class as the rest.

English.	Fan.	English.	Fan.
One	fo	*Six*	shémé
Two	véi	*Seven*	zangoua
Three	là	*Eight*	moûm ouam
Four	nè	*Nine*	iboum ibou
Five	tani	*Ten*	woôm aboum.

On the Old Calabar the change is somewhat greater. Still, the so-called Kaffir or South-African characters have long been recognized in these parts; and the nearest congeners of the *Otam*, *Udom*, or Old Calabar, are the Isubu and Dualla.

(*Languages with Otam, Isubu, Bakele, and Nufi, affinities from the Polyglotta Africana.*)

Fire	ngon	ngun	ngon	ngun
Water	alap	alap	aneb	ayib.

The languages akin to the Otam have been so thoroughly recognized as Kaffir, or South African, that they are given in the present chapter; though they are, really, transitional. Of those that next come under notice all that can be said is that they have, generally, been associated with their congeners to the north rather than the south. They have, however, affinities on either side.

CHAPTER LXX.

The Bonny, Brass Town, Ibo, and Benin languages.—The Mandingo, Accra, Krepi, Kru, &c.—Remarks on the Mandingo class.—The Begharmi.—Mandara.—Kanuri.—Hawssa.—Sungai.—Kouri.—Yoruba.—Tapuâ or Nufi —Batta.—Fula, &c.—The Serawulli—Woloff, &c.—Hottentot.

THE Okuloma and Udso are *Obane* (or *Bonny*), the Aro and Mbofia, *Brass Town* (*Oro* or *Ejo*), dialects. The remainder belong to the interior of the Delta of the Niger; the Isoama and Isiele being *Ibo* Proper, or Ibo in the limited sense of the term. It is a name, however, which may be given to the whole class.

English.	Okuloma.	Udso.	Aro.	Mbofia.	Sobo.
Man	oubo	owebo	nowoke	unyoka	osale
Woman	erebo	yorobo	unwai	nuame	aye
Head	dsibe	tebe	isi	isi	uhiomi

Fire	itari	etare	igesane	oko	oko
Water	ame	ame	ame	mmeli	mmi.

I now come to a group, which, in the present state of our knowledge, must be treated as the Bhot and Burma group was treated in Asia. It is a large one in every respect: large in respect to its geographical area; large in respect to the members of which it consists. It is a complex one as well: inasmuch as it falls into divisions and sub-divisions. And it is also a wide one; *i. e.* its extremities differ greatly from each other. Lastly, it is provisional, and, more or less, artificial. I shall exclude from it the Woloff and some other tongues on the north. I have excluded from it the Ibo and some other tongues on the south. Yet, I fail to find a clear line of demarcation. The class, in short, is certainly either too large or too small. It stands, however, as it is, because it is valid as far as it goes; because it is convenient; and, finally, because any misconception as to its character, any possibility of mistaking it for a natural instead of an artificial one, has been guarded against.

Roughly speaking, it extends from the Niger to the Gambia, and includes the numerous dialects and subdialects of the *Slave*, *Gold*, *Ivory*, *Pepper*, and *Grain Coasts*, along with the *Mandingo* languages. Towards the interior its extent is uncertain; whilst, on the coast, there is a strip of low land not belonging to it: so that, in tracing it along the Atlantic, we first lose and then find it again.

At the mouth of the Formosa the Yebu dialect of the Yoruba touches the sea with the Benin at its back stretching inland. The main language, however, is that of Dahomey, spoken (there or thereabouts) from Lagos to the Volta, and extending far inland, with the *Anfue*, the

Dahomey Proper, and the *Mahí* as its chief dialects; each with divisions and subdivisions. The numerous vocabularies headed Fot, Popo, *Widah*, Atye, Mahí, and Badagry, &c., belong to this great group.

English.	Widah.	Dahomey.	Mahí.

Fire	ozo	zo	uzo
Water	zi	zi	ezi.

The *Accra, Inkra,* or, as the natives call it, the *Gha* language, is nearly related to the Otshi, being spoken near Cape Castle; the *Adampi* being a dialect of it.

The *Kerrapay* is spoken in Abiraw, Odaw, Aokugwa, Abonse, Adukrum and Apiradi, villages or towns of Akwapim, other than Otshi; in which, however, the Otshi, as the language of the dominant population, is generally understood.

Date and Kubease, like Abiraw, &c., are Akwapim villages, whereof the language is other than the Otshi. It is, also, other than the Kerrapong, Kerrapay, Kerrapi, or Krepee; what it is being uncertain.

(1.)

English.	Adampi.	Anfue.

Ten	nu'mah	nu'mah	ā'wo.

The *Otshi* is the language of the Gold Coast; such, at least, is the name given by the chief authority for

its grammatical structure—Riis. The numerous vocabularies of Bowdich named *Inta* belong to this class. Another general name, (and perhaps) the best, is *Fanti.*

The Ashanti of Coomasee, the capital, along with the Coromantin and the Boroom, belongs to this group. So do the numerous vocabularies of the *Mithridates* headed Akkim, Akripon, Fetu, &c.

For the Ivory coast the following vocabulary of the *Avekvom* is the only one I know.

English.	Avekvom.	Other Languages.
Arm	ebo	ubok, *Efik.*
Blood	evie	eyip, *Efik;* eye, *Jebu.*

Go	le	olo, *Jebu.*
Kill	bai	fa, *Mandingo;* pa, *Jebu.*

That the *Kru* languages are either actually Mandingo, or members of a closely-connected class, is certain. Dr. Kölle, indeed, separates them. The present writer did so in 1847; the *data* being, at that time, both insufficient and imperfectly known to him. Soon, however, after the publication of his treatise Mr. Dupuis informed him that he held the two groups to be intimately allied; if, indeed, they, really, were two. Dr. Bleek has expressed himself (and I believe he is the first writer who has done so in print) to the same effect:—"The Mena" (Mandingo) "family which includes the dialects spoken by the Krumen," &c.

(*From the Polyglotta Africana.*)

English.	Dewoi.	Bassa.

Water	ni	ni	ni.

The Mandingo Proper is the language of the Mahometan Blacks of Medina and the Lower Gambia. Being occasionally written in the Arabic character, it has a

tincture of cultivation. Though we can scarcely call it classical, the Mandingo of Medina is the standard dialect of the group.

If we look to the *Polyglotta Africana* for the proper Mandingo forms of speech we find the following thirteen: — 1. Mandingo = Kalbunga, Toronka, Jallunka, Kankanka; 2. Bambarra; 3. Kono; 4. Vei; 5. Soso (Súsú, or Soosoo) = Solima and Kisekise; 6. Tene; 7. Gbandi; 8. Landoro; 9. Mendi; 10. Gbese; 11. Toma; 12. Mano; 13. Gio.

The differences between the Mandingo, Jallunka, and Bambarra, have always been considered small. The Kono is an allied form of speech under a new name. The Vei is more like the Mandingo Proper than its geographical position suggests.

The Súsú, probably, includes the Tene.

In Jallonkadu the language is in contact with the Fulah of Futa-torro.

In Bambarra, the language is said to be mixed with the Woloff and Fulah.

In Bambarra, too, it has departed considerably from the strict Mandingo type, and becomes either a well-marked dialect, or a fresh language. Between Sego and Jenné (both on the Niger) it is replaced by the Sunghai.

More divergent than the Jallunka and Bambarra, but, still, visibly Mandingo, the Susu is spoken over a large unexplored tract at the back of Sierra Leone, of which the best-known tribes are the Sulimas, described by Major Laing. Bounded on the north by the Fulahs of Futa-dzhallo, they are Black Pagans, with warlike dispositions, and commercial aptitudes.

The *Kissi* lies to the south of the Sulima; being, probably, a dialect of the Susu.

Between the Vei district about Cape Mount and the Kissi country, lies the *Mendi*.

The *Vei*, spoken over a small tract of country, extends

from the Gallinas to Cape Mount: extending inland 40 or 50 miles. It seems to be intrusive; and there is a belief amongst the Vei themselves that they migrated from the Mani country under the captainship of two brothers Fabule and Kiatamba. When this took place is uncertain.

The existence of a native alphabet has given prominence to the Vei language. The first notice of it was given by Lieut. Forbes, in 1849, who inquired whether the missionaries of Sierra Leone had ever heard of a written language amongst the natives of the parts about Cape Mount. He also showed a MS. which was soon afterwards in England and in the hands of Mr. Norriss, who deciphered and translated it. Meanwhile the missionary committee appointed Mr. Kölle to visit the country referred to by Lieut. Forbes and to make inquiries on the spot. This led him into the presence of a Vei native, named Doalu Bukere, about forty years old; who, assisted by five of his friends, invented the alphabet in question.

Without undervaluing Doalu Bukere's ingenuity, we must remember that, as a boy, he had learned to read English, and afterwards, Arabic. When grown-up to be a man he was all but a regular letter-carrier. His masters, who were slavers, and traders, despatched him to distant places as a messenger, and he told Mr. Kölle that the communication of distant events by means of the letters he conveyed struck him forcibly. "How is this, that my master knows everything I have done in a distant place? He only looks at the book, and this tells him all. Such a thing we ought to have, by which we could speak to each other even though separated by a great distance."

The *Sokko* is associated with the Jallonka in the *Mithridates;* and when we remember how scanty were our *data* when that great work was composed,

we may readily infer that its affinity is pretty palpable. It probably belongs to the most eastern division of the proper Mandingo class; since it must be looked for in the district of the Kong Mountains, with their direction from west to east, and their parallelism with the coast of the Gulf of Guinea. Whether it lie to the back of the Grain Coast, where the Kru prevails, is uncertain. It is more likely to be found to the north of the Ivory Coast. At any rate Oldendorp, who took his information from three individuals of three tribes, states that their country bordered on that of the Amina —the Amina belonging to the Fanti class, the Fanti class of which the Gold Coast is the special occupancy. I have enlarged upon this, because the extent to which an undoubted Mandingo tongue comes in contact with both the Fanti and the Kru areas is a point in favour of the affiliation of the three groups.

I now give a sketch of eleven languages which are conveniently taken together. They form as natural a group as circumstances permit; and are as follows:—

1. Begharmi, the most eastern of the group.
2. The Mandara.
3. The Kanuri of Bornú.
4. The Hawsa.
5. The Sunghai.
6. The Kouri.
7. The Yoruba.
8. The Tapua or Nufi.
9. The Batta.
10. The Fula.
11. The Tibbu.

Their general order is from east to west; and the district to which they belong reaches from Lake Tshad to the Niger. It is pre-eminently an inland district. It is an intertropical one. It is, to a great extent, destitute of great rivers; without being a desert. It is subtended by the parts below 9° N. L., or, the *terra incog-*

nita, for the northern half of Africa; from which it follows that, whether the languages under notice have or have not affinities on their southern frontiers, such affinities as may exist are unknown. This is much the same as saying that the further we go south, the further we recede from Mahometan, and advance into Pagan, Africa.

So much for its southern limit. On the north it underlies the Sahara in respect to its geography, and the Arab and Amazig areas in respect to its ethnology and philology — the Arab and Amazig areas both being Mahometan. It may be added (though the remark is in anticipation of what will appear as we proceed) that it is nearly co-extensive with the ground covered by the Fula conquests.

It is a zone, or band, and, though some of its occupants have comparatively light-coloured skins, it is, as contrasted with the broader zone to the north, a Black Band. It has been called Nigritia. It has been called Sudania. But it is a Black Band only when contrasted with northern Africa.

All the above-named languages are, in the present state of our knowledge, separated from each other by definite lines of demarcation. It may, perhaps, be added that they are all equi-distant from each other, *i. e.* the first on the list is (about) as like or unlike the second as the second is like or unlike the third. They have all miscellaneous affinities; though the special ones are less than the geographical relations suggest. At the same time, as far as they go, it is with the geographical relations that the affinities coincide. The intrusive Fula, with its wide and irregular distribution, is, perhaps, an exception to this rule.

To the north of Lake Tshad, along with the Tibbu of Kanem, the Arabic of the Beni Suliman and other tribes, is spoken; whilst farther to the west lies Darsaleh, Waday, or Borgho, of which notice has already been taken.

(1.) The *Begharmi* is conterminous with the Tibbu, the Bornui, and the Mandara on the north, west, and south, the details of its eastern frontier being unknown. It may or may not touch the Mobba and Dar-runga areas. It is known by vocabularies only, of which Denham's is the chief.

(2.) The Mandara is the nearest approach we have to a language of the interior of Africa, being the only one spoken south of the tenth degree of latitude in any part of the continent equally central. Indeed, the tenth degree on each side of the equator bounds the *terra incognita*. Towards the eastern and western extremities of the zone thus described, Burton, Livingstone, and others have explored; but for the interior Denham and Barth are our only authorities. The Mandara is one of the languages given in the forthcoming list of the languages of Adamowa, Hamarua, and the parts around. (See p. 589.)

(3.) It is a current statement that as many as thirty different tongues are spoken in Bornú. This we get from a notice by Lucas whose informant was an official of that country. Seetzen throws a little light upon this; his informant having been a negro of Affadeh. The first language enumerated by him is—

1. The *Mana Birniby*, or speech of *Bornú* itself.

2. The *Amszigh Mpade*, a country six days' journey northwards.

3. The *Mszam mkalone Kamma*, or the speech of a country seven days east of Affadeh, called by the Arabs *Kalphey*.

4. The *Amszigh Affadeh*.

Towards our knowledge of the other twenty-six, the following list was obtained by Seetzen from a negro of Mobba, whom he met at Cairo.

5. The *Kajenjah*. 6. The *Updérrak*. 7. The *Alih*. 8. The *Mingon*. 9. The *Mararet*. 10. The *Massalit*. 11. The *Szongor*. 12. The *Kuka*. 13. The *Dadshu*. 14. The *Bandalah*. 15. The *Masmajah*. 16. The *Njorga*. 17. The *Dembe*. 18. The *Malangœ*. 19. The *Mime*. 20. The *Koruboih*. 21. The *Gonuk*. 22. The *Kabka*. 23. The *Guranguk*. 24. The *Dshellaba*.

Of these the *Amszigh Mpade* may be the Amazigh, a language of the Sahara rather than Bornú itself. In like manner some of the others may belong to the Bornú Empire rather than to the district so-called. Of the Affadeh, however, we have, *eo nomine*, short specimens. It is closely akin to the *Mana Birniby*, the Proper Bornui, or *Kanuri*.

The Arabic alphabet has been applied to the Kanuri; the *data* for Norriss's Kanuri Grammar having been a collection of dialogues from Madame de Genlis's *Manuel de Voyageur*, a translation of two chapters of the New Testament, and the draft of an agreement to be made with one of the petty kings of the interior of Africa. These were written at Tripoli, and sent to England by the late Mr. Richardson; there was a similar translation into

the Hawsa. The author was an Arab. Kölle's grammar was framed upon conversations with a native of the province of Gazir whom the author found at Sierra Leone.

Mr. Norriss, enlarging upon the extent to which the Kanuri differs from the other languages, compares its structure with that of the Turk dialects. Its roots are not subject to any modification; it forms its plural by adding a syllable, and it has a somewhat full inflection, consisting wholly of postpositions.

(4.) Whatever may be the areas for the (?) twenty-seven unknown languages of Bornú, they are not on any of the explored portions of the *Hawsa* frontier, inasmuch as the two languages meet. The Hawsa, like the Bornú, has been written in Arabic characters, whilst from Schön's grammar we learn the details of its structure. It gives either the germ or the fragment of a peculiarity, of which more will be said when the Yoruba comes under notice.

(5.) Roughly speaking, the *Sunghai* area is bounded by 13° N. L. and the Niger; the line of demarcation being a chord and an arc. The line of latitude runs straight, whilst the river, which meets it at both its extremities, approaches N. L. 18°. Between these lies the great mass of the Sunghai area, though not exclusively. On the north it is bounded by the Arabic and the Amazig, both encroaching languages; on the west by the Serawulli (?) and the Bambarra; on the East by the Fula and Hawsa; on the south by the Kouri of Tombo, Mosi, and Gurma; the line of demarcation here being pre-eminently obscure. All along the northern frontier there is great intermixture—men of Sunghai blood using the Fula, Hawsa (?), Amazig, Arabic, Serawulli (?), and Mandingo dialects, and *vice versâ*. Gógó, the ancient capital of a kingdom, stands in Sunghai ground. Timbuktú, more famous

* For the explanation of these two columns see the appendix.

still, does the same. To the south of Timbuktú the Iregenaten Tuariks have intruded far in the direction of the Kouri frontier; between whom and the Niger lie several independent tribes; amongst whom, it is probable, that foreign admixture is at the *minimum*. Their land, however, is a *terra incognita*. Of their language I only know one sample from the extreme west, and one from the parts about Timbuktú.

(6.) The chief districts of the *Kouri* area are Gurma, Tombo, and Mosi. Of these, the former is less Kouri than the other two; this is because Gurma is on both the Sunghai and the Bambarra frontiers, from each of which there have been pressure and encroachment. Pressure, too, and encroachment have also been effected by the Fulas. That Gurma is a Sunghai name, as suggested by Barth, is probable. At any rate, it is not native. The Gurma people call the Hawsa people Jongoy. The Tombo, like Gurma, has been encroached upon by the Fulas, so that Mosi is the district which is most especially Kouri. It is Pagan, and broken up into small principalities. The Bambarra name for the Mósi is *Móreba*. The Mosi themselves call—

The Fulas	Chilmigo,
— Sunghai . . .	Marenga,
— Gurma . . .	Bimba,
— Wangara . . .	Taurearga,
— Hawsa . . .	Zángoró,
— Ashantis . . .	Santi.

Kölle calls it the North-Eastern High Soudanian, but the present writer, in 1855, suggested the name under notice on the strength of a vocabulary of Mrs. Kilham's, representing the same language with the Tembu of the *Mithridates*. In the *Polyglotta Africana* there is also a Kaure, as well as a Kiamba, Dzhamba, or Tem specimen.

The members of this group, according to Kölle, are

1. Mose; 2. Dselana; 3. Guren; 4. Gurma; 5. Legba; 6, Kaure; 7. Kiamba; 8. Koama; 9. Bagbalan; 10. Yula; 11. Kasm. Of all of these forms of speech Kölle gives specimens.

To this we may add the Yngwe, and Dagwhumba numerals of Bowdich.

In Clarke we get the following additions:—1. Yana; 2. Brinni; 3. Nibulu; 4. and no less than 4 Tshambas.

Yana is stated to be near Appa and Tshamba. It is, probably, a transitional dialect, with Inta, Mandingo, Yoruba, and Ibo affinities.

The Brinni are called a tribe of the Fula race in the interior, not far from Umwalum and Tshamba. Bangsa and Pumpluna are near to Tshamba. This statement as to the Fula affinity is exceptionable. They are decidedly in the same class with the Nibulu.

Nibulu is simply said to be in the Tshamba country.

When we look to the word *Tshamba* itself, we learn that there are three or more places of this name, 1st, near Igarra, on the river Odu; 2nd, between Mandingo and the Kong Mountains; 3rd, near Corisco Bay at Nibulu. Now as *Tshamba* is the word of salutation at this place, some confusion may have arisen, which future researches will explain. At any rate, the combination *mb* preceded by *k*, *t*, *sh*, &c., is common. There is the Ti*mb*u country on the Senegambia, Ki*mb*o, Ti*mb*u-ctu, Aqui*mb*o, Ada*mp*i. In Balbi there is a Tje*mb*u or Kassenti. The Tambu of Oldendorp is the T*dam*pi of the Gold Coast. Whatever may be the explanation of all this, it is clear that the word as a name of the class under consideration is inconvenient. Whether *Kouri* (the term proposed by the present writer) be the best name is another question. It is less ambiguous than Tshamba; shorter than North-Eastern High Sudanian.

The watershed, marked in the map as the Mountains

of Kong, between the rivers which empty themselves into the Gulf of Guinea (the Volta, &c.) and the feeders on the right bank of the Niger, belongs to the Kouri country, which, in some parts, touches the Niger itself. It lies in the longitude of Greenwich, and (perhaps) 8 degrees on each side of it, and in 10 N. L. It is certainly a broken and mountainous country with a pagan population.

The question which now arises touches the accuracy of the boundary by Kölle, who limits the group under notice to the forms of speech enumerated by him. I would add to it, at least, two of his South African languages, the Barba, and the Boko. The Barba he identifies, from memory, with the Borgu of the Hawsa. Boko touches Busa on the Koara.

English, head, hair.
Barba, *wiru, siru.*
Mose, *zuru.*
Legba, *nyoro.*
Kaure, *nyoro.*
Kasm, *yuru.*
Aku, &c., *oru.*

English, face.
Barba, *wusoa.*
Legba, *esa.*
Kaure, *esa.*
Kiamba, *esanda.*
Aku, *odsu.*
Kambali, *lisu.*

English, nose.
Barba, *nueru.*
Mose, *nyore.*
Guresa, *nyor.*

English, eye.
Barba, *noni.*
Mose, *nini.*
Guresa, *nun.*

English, ear.
Barba, *so.*
Boko, *zea.*
Guresa, *tui.*

English, mouth.
Barba, *no.*
Legba, *noio.*
Koama, *ni.*
Kasm, *ni.*

That the Boko and Barba should be Kouri is only what we expect from their geographical situation.

Is there any other class besides the Kouri for the unexplored parts between the Kong Mountains and the Niger? In other words, do we, when we get the Kouri class, get a class that completes our ethnographic and philologic knowledge for these parts? We do. No unplaced language is likely to be discovered. This is inferred from the fact of the limits of the Kouri class, being formed, on all sides, by some known language. Thus:

1. On the north, it touches, and, perhaps, graduates into, the Mandingo, Sunghai, and Hawsa.

2. On the south, it touches the Kru, the Avekvom, the Inta, the Dahomey, and Yoruba groups of the Grain, Ivory, Gold, and Slave coasts.

3. On the east it reaches the Hawsa, and

4. On the east, and south-east, the Nufi.

With all of which it has miscellaneous affinities.

If the Kouri has relations to the Mandingo and the Nufi on one side, it has also relations to the Sunghai of Timbuktú on the other. Perhaps, it is the language to which the Sunghai of Timbuktú is most especially like. The pronoun of the first person singular is *ai*, or *a* in both the Timbuktú of Kölle, and his Yula and Kasm; to say nothing of other definite glossarial likeness.

That the so-called South-African characteristics were likely to be found in the Kouri is stated in the paper of April 27, 1855. I now add that *abalo* = *man*. The name of a Kouri population is *nibalu*; probably = *men*. Should this be shown to be the case, we have the Kaffir-like plurals in a fresh language.

(7.) The *Yoruba* area lies, there or thereabouts, between 2° and 6° W. L., and 6° and 10° N. L., being bounded by the Dahomey, the Kouri (?), the Nufi, and the Ibo languages and the sea. The Fula has encroached upon it. It has a well-defined boundary, and the

language is well defined also: indeed, few African languages are better capable of being definitely limited. So is it geographically, so philologically. Its nearest congeners are the Kouri, Nufi, and Ibo, and it has miscellaneous affinities besides. Until the publication of Crowther's grammar, the author of which, himself a native of the country, is a clergyman of the Church of England, little was known of it beyond a few vocabulary specimens. It has now been studied with more than average attention. A paper upon it by D'Avezac in the Transactions of the French Ethnological Society enlarged upon the extent to which it was what was called a *monosyllabic* language. But are not all languages, when we get to the roots, something of the kind? The real fact is this—without being more monosyllabic than many other tongues, the Yoruba is more easily than many others reducible to its elements. The best analysis of it is by Bishop Vidal the editor of Crowther's second edition. He enlarges upon the extent to which it is deficient of inflection. This means that the relations of time and place are expressed by separate words. He takes note of the important part played by accents.

He notes, too, what he calls the *Vocalic Euphony*. Let the vowels be separated into two classes, and let *o*, *e*, *i*, *ĭ*, *u*, and *ŭ* be called *open*; whilst *o*, *e*, *a*, and *a*, are *close*. Let the full forms of the pronouns be *eme* = *I*, *iwo* = *thou*, *on* = *he*, *she*, or *it*. When these precede verbs like *ko*, *shi*, *she*, *shĭ*, *ku*, or *lŭ*, they are *mo*, *o*, and *ó*, i. e. *open*. Whereas if they precede verbs like *kọ*, *fẹ*, *la*, or *kạ*, they are *close*. The same is the case with the negative particle which is *ki*, *ko*, or *kọ*, according to the vowel of the verb. He indicates either a germ or a fragment of a like system in the Hawsa.

Another remarkable phenomenon—by means of a regular system of prefixes we get from a root like *she* = *sin*, the following derivatives:—

a. Prefix *i*, and the root becomes either an infinitive verb, or something closely akin to it, *i. e.* if *she* = *do*, *fẹ* = *love*, *mo* = *know*, or *lo* = *go*, *iṣe*, *ifẹ*, *imọ*, *ilọ* = *the act of doing*, *loving*, &c.

b. A more concrete meaning is given by substituting *a* for *i*. Thus, *afe* = *a state of loving*, *alo* = *a going*.

c. *A li* gives an inchoative sense; thus *atilo* = *the act of going*; *atife* = *the act of loving*, considered as not yet in full exercise, but about to be so.

d. *A* is a negative; hence, *a-imo* = *not knowing*, or *ignorance*.

e. *A* also denotes an agent; thus, from *pejja* = *fish*, and *konrin* = *sing*, we get *apejja* = *a fisherman*, *akonrin* = *a singer*.

f. *Ni* = *have*; and, as a prefix, implies the possession of the attribute suggested by the verb. Thus, *idajọ* = *judgment* comes *nidajọ* = *to possess judgment*. In certain cases in which the vocalic euphony plays a part, this *n* becomes *l*, as it is in the example of the table.

g. Prefix, where *ni* is retained, *o*, and, in other cases, the initial vowel of the word which it precedes, and it gives a noun like *onidajọ* = *one who judges*, or *judge*.

Vocabularies headed (1) Ota, (2) Egba, (3) Idsesa, (4) Yagba, (5) Eki, (6) Dsumu, (7) Oworo, (8) Dsebu, (9) Ife, (9) Ondo, (10) Dsekiri, in addition to the Yoruba Proper, are all to be found in Kölle, as sub-dialects of the Aku: followed by one of the Igala as a separate dialect—falling, however, into no sub-dialects.

(8.) *The Nufi Class.*—*Mutatis mutandis*, the criticism which applies to Kölle's North-Eastern High Sudanian, applies to his Niger-Tshadda, class. It may more conveniently be called Nufi, from its chief language.

Additions are to be made to it from the pages of the *Polyglotta Africana* itself; viz.:—

1. The Yala, an unclassed language, is Nufi.

2. The Dsuku and Eregba, which Kölle makes South African, are Nufi.

In the *Polyglotta Africana*, the Dsuku, along with the Eregba, forms the third section of the eighth group, headed Atam Languages; whilst the first of Part 2 contains *South African Languages, distinguished by an initial inflection.* As such, it is separated from 1. Nupe; 2. Kupa; 3. Esitako; 4. Musu; 5. Goali; 6. Basa; 7. Ebe; 8. Opanda; 9. Egbira-Hima. To these, however, the vocabulary connects it, at least, as much as to any other group.

English.	Appa.	Eregba.	Dsuku.
One	uniieen	unye	atsu
Two	ifa	ifa	apiana
Three	ita	ita	atsala
Four	ini	ini	anyera
Five	itun	ithu	tsoana
Six	teniieh	itinye	tsindse
Seven	tifa	itafa	atsumpi
Eight	tita	itita	tsuntsa
Nine	tini	itini	tsunyo
Ten	ubo	ubo	atsue.

If we now look back upon the details of these two classes, we find them to run as follows:—

1. In the Kouri, we have the Kouri of Mrs. Kilham, the Tembu of Oldendorp, and the *Mithridates*, the Hio, Yrgwe, and Dagumba of Bowdich, the Mose, Dselana, Guren, Gurma, Legba, Kauri, Kiamba, Koama, Bagbalan, Barba, and Boko of Kölle; the Yana, Brinni, Nibulu, and 4 Tshambas of Clarke.

2. The Nufi contains the forms of speech illustrated by the following vocabularies: Nupi, Appa, Kupa, Esitako, Musu, Goali, Basa, Ebe, Opanda, Egbira-Hima, Ergeba, Dsuku, Tapua (Tappa), Biyanni, Shabbie, Kakanda, Nupaysi.

Apparently, a language of Kölle's, called the Kambali, is intermediate to the Nufi and the Kouri.

(9.) The preliminary remarks of Dr. Barth on the Batta language are as follows :—"The Batta-ntshi is spoken from Garrua, a place three days E. of Yóla, in the district of Kókorni, as far as Bátshàma, three days E. of Hammárua. To this language belong the names of the two large rivers of Adamawa, Fáro, 'the river,' and Bénoé, 'the mother of waters.'

"The other languages are the following :—The Búma-ntshi, spoken by the Umbúm and in Baia ; the Dama-ntshi, the language of Bobanjidda ; the Buta-ntshi ; the Tekar-tshi ; the Munda-ntshi ; the Fala-ntshi ; the Marga-ntshi ; the Kilba-ntshi ; the Yangur-tshi ; the Guda-ntshi, spoken by a very learned people, the Gudu, living on a plain surrounded by mountains, near Song ; the Tshamba-ntshi ; the Kótofa-ntshi, spoken by the Kótofo, whose large river, the Déwo, comes from Kout-sha and joins the Benue ; the Wera-ntshi ; the Dura-ntshi ; the Woka-ntshi ; the Toga-ntshi : the Lekam-tshi ; the Parpar-tshi ; the Kankam-tshi ; the Nyang-eyáre-tshi ; the Musga-ntshi ; the Mandara-ntshi ; the Gizaga-ntshi ; the Ruma-ntshi ; the Gidar-ntshi ; the Daba-ntshi ; the Hina-ntshi ; the Maturna-ntshi ; the Sina-ntshi ; the Momoyee-ntshi ; the Fáni-ntshi ; the Nyega-ntshi ; and finally the Dewa-ntshi ; all these languages being so widely different from each other, that a man who knows one of them does not at all understand the others."

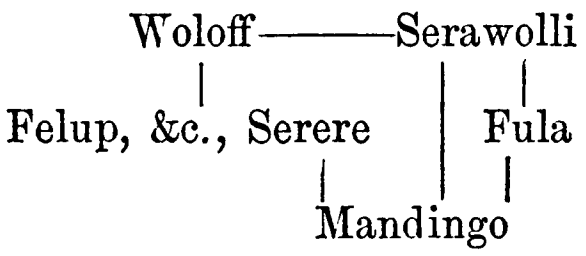
(10.) A few remarks may now be made upon another language: one of greater political and geographical importance than any of the preceding class; a language hitherto uncultivated, but one which is, by no means, unlikely to develope itself as the medium of an imperfect native literature, nor yet likely to be overlooked by the missionary and merchant for religious and commercial purposes. I mean the *Fula*, Fulah, Felletta, Fellata, Fulani, Fulanie, Filani, and Filanie tongue. A native conqueror, scarcely a generation back, named Danfodio, spread the Fula conquests as far west as Bornú and the frontier of Waday. He carried them far into the Hawsa, Yoruba, Sunghai, and Kanuri countries. He was a Mahometan, and, as such, the leader of a population strongly contrasted with the native pagans of the true and typical Negro conformation. From this the Fula physiognomy departed, though not always to the same extent. As a general rule, however, the Fula skin was lighter; so much so, that one section has long been known as the Red Peuls or Fulas.

The chief languages with which the Fula was at first compared, were those of the countries into which it intruded; the Hawsa, Yoruba, Bornui, &c. It was not likely to show very decided affinities with these; inasmuch as they lay beyond the pale of its proper and original *situs*. What this original *situs*, however, was is easily investigated. The home of the race seems to have been the highlands that form the watershed of the Senegal and Gambia; so that the languages with which it originally came in the closest contact were the Woloff and Mandingo. But as the Mandingo itself has en-

croached on the forms of speech in its neighbourhood, much displacement and obliteration of such intermediate forms of speech as may have originally existed has been effected. We do not, then, expect very decided affinities even here. It is the opinion of the present writer, however, that, whether great or small, they are greater in this direction, than any other; the Woloff being the nearest congener, and the nearest approach to a transitional tongue being the Serawulli. The very scanty specimens of the *Mithridates* are enough to suggest this —these making the Serawulli partly Woloff, partly Mandingo, partly Fula. If so, the affinities are thus:



This, however, is in anticipation of the languages of another group.

(11.) The Tibbu will be noticed in the Appendix.

The first language of the next class is the *Serawulli* or *Seracolet*, conterminous with the Arabic on the north, and the Woloff on the west, and spoken over an extensive, but imperfectly-explored district towards the south-western frontier of the Sahara. Parts of Ludamar, Galam, Kaarta, and the Bambarra country, are Serawulli. Kölle states that there are six Serawulli tribes, the Gadsaga, the Gidemara, the Hanyaga, the Dzafuna, the Haire, and the Gangari. Their physical form is that of the Woloff, and Sereres; their Mahometanism equally imperfect. Their energy and intelligence have been extolled.

The area given to the Azeriye, Aswarek, or Swaninki, by Barth, is of considerable size and importance: extending from the parts about Sangsangdi, which he particularly says was, originally, an Aswarek town, to Wanad, in N. L. 21°. Now this is the most northern spot where a Negro population is found *in situ*. The language is, of course, in contact with the Arabic and

Amazig, or with the Arabic by which the Amazig has been replaced, no Negro language being at this degree of latitude in contact with it. On the south, it is met by the Wolof, the Sungai, the Fula, and the Mandingo of Bambarra: possibly by some of the Kouri dialects. The blood of many a man who speaks Arabic must be more or less Azeriye.

The great centre of the Aswarek seems to have been El Hodh; Baghena being the district wherein, at present, they are most numerous.

The *Sereres* is spoken about Cape Verd, the Wolof being spoken all round it. It is isolated, but has miscellaneous affinities. We have no grammar of it and but few vocabularies.

The *Wolof*, or *Jolof*, is spoken between the Senegal and the Gambia; not, however, continuously. It is interrupted in the parts about Cape Verd. On the north it is bounded by the Arabic of Ludamar.

It is the first true Negro language of the seaside which is met with on the western coast of Africa. The States or kingdoms of Walo, Baol, and Kayor (this last being to the *north* of the Senegal), are Wolof. Kajaga, or Galam, is partly so.

A grammar by Dard (*Grammaire Ouloff*) is our chief authority for its structure; in which the peculiarity which has attracted most attention is the initial change of the article. It begins with the consonant of the noun to which it belongs; whatever that consonant may be.

Such congeners as the Wolof may have had to the north have been swept away by the Arabic of the Moors; so that on one side, at least, it is an isolated language. Neither are its other affinities either very decided or very numerous; but, on the contrary, few and miscellaneous. They are greatest, however, with the languages with which it is conterminous. On the west, it is cut off by the ocean. In the direction of Cape Verd it seems to have encroached.

Now comes a group of a miscellaneous, artificial, and provisional character; consisting of certain true Negro languages spoken between the Wolof and Mandingo areas and the Ocean.

Padsade is the name of a vocabulary in Kölle, taken from a native of a town called Udadsa three or four days' journey from the sea.

English.	Padsade.	English.	Padsade.

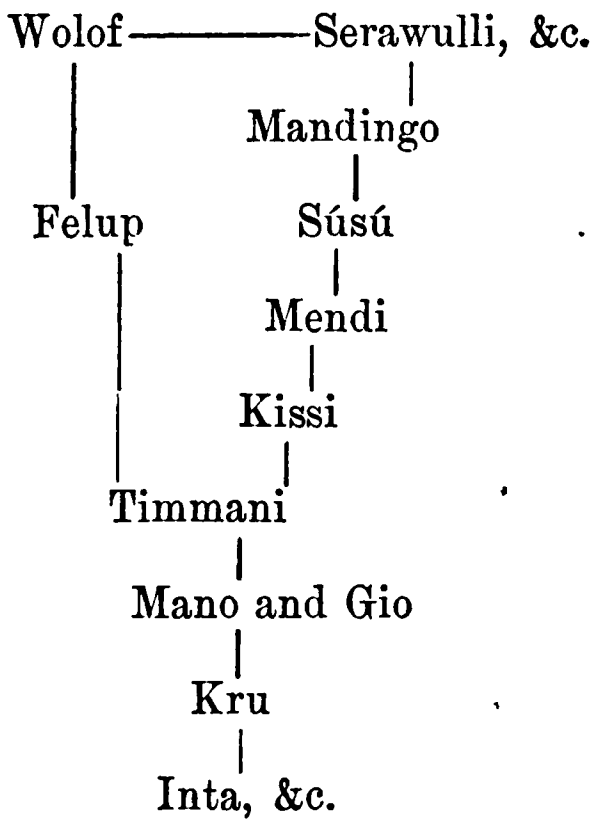
Fire	sefara	imbe	ta	dyom
Water	ndoh	dsi	dsi	mem.

The system of affinities here is complex. In the Mandingo class the Gbandi, Landoro, and Mendi, appear to lead, through the Kissi, the Timmani, and the Bullom, and through these to the Papel, Felup, Wolof, &c.

The Gbese, Toma, Mano, and Gio lead (as their geography suggests) to the Kru forms of speech; these leading to the Inta tongues of the Gold Coast, &c.

Lastly, the Mandingo Proper points to the Wolof, through the Serawulli.

If so, the classification is that of the following map, table, or diagram :—



Of these the Timmani and Wolof, from the conspicuous character of their initial changes, which, in the latter of the two languages, are well known, have generally been treated as either isolate or South African.

CHAPTER LXXI.

The Hottentot.

WITH the Hottentots, decided philological, coincide with decided anatomical, differences; though, with each, there has been exaggeration. In the Dammara country the difference between the Hottentot and the Kaffir is at its *minimum*.

English.	Bushman.	Korana.	Saldanha Bay.	Hottentot.
Man (homo)	t'kui	t'kohn	——	qûorque
—— *(vir)*	t'na	kŏuh, kauh	——	——
Woman	t'aifi	chaisas	ankona	kyviquis
Head	t'naa	minuong	——	biqûa
Eye	t'saguh	mumh	——	mu
Ear	t'no-eingtu	t'naum	naho	nouw
Nose	t'nuhntu	t'geub	tui, zakui	thuke, quoi
Tongue	t'inn	tamma	tamme	tamma
Hair	t'uki	t'oukoa	——	nuqua-an
Hand	t'aa	t'kŏam	onecoa	omma
Foot	t'oóah	t'keib	coap	itqua, yi
Sky	t'gachuh	——	homma	——
Earth	t'kanguh	——	hũ	kâmkâmma
Sun	t'koara	sorŏhb	sore	sorre
Moon	tkáukăruh	t'kaam	——	toha
Fire	t'jih	t'aib	——	ei
Water	t'kohaa	t'kamma	ouata	kām
One	t'kŏay	t'kŏey	——	q'kui
Two	t'kuh	t'koam	——	k'kam
Three	——	t'norra	——	k'oune.

The sound expressed by *t'* is what is generally known as the Hottentot *click*. It is said to be found in some of the Bichuana dialects of the Kaffir.

CHAPTER LXXII.

On the African Languages in general.

LIKE Polynesia, Africa is connected with Asia by an isthmus; a fact which narrows the range of its philological affinities.

Like South America, Africa is separated from its nearest continent not only by an isthmus but by a narrow pass of water besides; a fact which gives two lines of migration—neither of them either implied or excluded by the other.

In the way of displacement on the frontier between Africa and Asia, the movement has been double. From Arabia there has been an extension northward; from Tartary and Persia an extension southwards and westwards. Add to this that for the whole of northern Africa we have little but the dialects of the Berber and Arabic, and the great width of the separation of the languages on the outcrop becomes evident; for, from Nubia and Abyssinia there is little *in situ* before we reach Caucasus on the one side and the Brahui districts of Persia on the other. Let those, however, who believe that any amount of displacement produces anything like absolute isolation (*i. e.* a language without, at least, miscellaneous affinities,) compare, *en masse*, Beke's Abyssinian and Klaproth's Caucasian vocabularies. Should they put down the coincidences to accident, let them compare the vocabularies of either series with something still further apart and they will find a de-

crease. Whether few or many, coincidences are distributed regularly rather than hap-hazard.

The African and Semitic languages are said to be characterized by a great development of the predicate, the Indo-European by a great development of the copula. This means, so far as it means anything, that whilst certain modes of action, such as the inchoative, frequentative, and the like, are predicative; others, like those involving the ideas of certainty, contingency, and time—those that give us the moods and tenses—are copular. As a matter of fact this is absolutely erroneous: inasmuch as the copula merely denotes agreement or disagreement between the subject and the predicate, having nothing to do with modes of any kind. There are few elementary works upon logic, which fail to tell us this. All, then, that can be said concerning the difference between a form giving a tense or mood, and a form giving an inchoative or a causative verb, is that, though they are both modes, they are modes belonging to different divisions of the genus; and this the grammarian well knows, or, not knowing, acts upon it unconsciously; making words like *now* and *then* adverbs, whilst he makes words like *frequently*, *often*, &c., no more—the one adverbs of time, the other of manner. Whether he be consistent in drawing so broad a distinction between *mood* and tense (*vocavi* and *vocarem*) on one side, and simple *mode*, &c. (*vocito*), on the other, is a different question.

The expression, then, is exceptionable. How stands the fact it is meant to convey? As far as it goes it is real. It is, however, anything but the fact in its integrity. The *dictum* applies to other languages besides the African: indeed, to all in an early stage of their development. In other words, forms like *vocito*, &c., originate earlier than forms like *vocavi*, *vocem*.

Upon the African character here given to the so-called Semitic languages, I should find it necessary to

enlarge had there been any definite criticism applied to the question. However, what with mixing up ethnology with philology and looking out for Indo-European affinities in grammar because the Jews and Arabs are liker to Europeans than to Negroes; what with treating an order consisting of a single genus as a large family or sub-kingdom; what with the fanciful dichotomy between the Semitic and the Hamitic—what with these and similar elements of confusion, the main facts, (viz. those found in the actual examination of the African languages themselves) have been omitted; the researches upon the Berber and Coptic being exceptions. Out of these has come the term *Sub*-semitic; a term which tells its own story. More than this—philologues, like Newman and others, have recognized beyond the pale of the Berber (or Amazig) Berber (or Amazig) affinities; the Hawsa and other languages being what they might (but do not) call Sub-amazig, or Sub-coptic; affinities which, indirectly, extend the Semitic class. Still, unless I read them wrongly, all these observations, however true, seem to be run one way only, *i. e.* they make the Hawsa, the Galla, and their congeners, Asiatic, rather than the Arabic, &c., African.

Yet the system of initial changes with the consonants and of medial changes with the vowels—characters which have always been held Semitic—is far commoner in Africa than it is in Asia, and far more characteristic of many African languages than it is of any Asiatic ones.

Something of the same kind of single-sightedness appears in the criticism upon the Kaffir characteristics. They have been found far beyond the Kaffir area. But the effect has been to get the Fanti, the Grebo, and other languages, called *South*, rather than to get the Kaffir called *North*, African.

The Semitic and the Kaffir (laying aside the Hottentot) are the two classes for which the lines of demarcation have been the strongest. They are, also, those

which I confidently predict that further inquiry will, more especially, break down. Respecting the other groups, it need only be added that Africa is the land which, above all others, requires us to classify by type rather than definition; and that, where the divisions are the clearest, and the isolation the greatest, the evidence of encroachment and obliteration is, sometimes, historical as well as inferential. It is pre-eminently historical with the Fula. It is a most legitimate inference with the Hottentot. It is historical with the Galla. It is a legitimate influence with the Berber.

On the direction in which the languages of the larger groups seems to have extended themselves I have but little to suggest. The uniformity of speech, *primâ facie* evidence in favour of recent diffusion, seems to point in the great Galla class to the Danakil area as the starting-point. The Berber has, apparently, moved from east to west; the Fula from the high regions between the Senegal and Gambia. The Hottentot, probably, has its nearest congeners to the north of the great Kaffir area; but where does this end? The Semitic dialects are, *perhaps*, Abyssinian in origin.

The phenomena of distribution are those of Asia and America, giving large groups, like the Berber and Kaffir, in contrast with moderate, though rarely with excessively small, ones. The difficulty, however, in the present state of our knowledge, of saying where the dialect ends and where the language begins prevents us from generalizing here.

The range of type, as well as the multiplicity of types, is greater in Africa than elsewhere; by which I mean that, if we look to single characters alone, there are more languages in Africa which exhibit strong single characteristics, than there are in Asia, America, or Europe. Of the internal changes of the Semitic, and of the alliterations and prefixes of the Kaffir, languages, notice has already been taken. The Man-

dingo, as far as it is known, is distinguished by the want of them; whilst the Timmani and Wolof exhibit them. The Coptic has long been recognized as pre-eminently agglutinate. The Galla and Kanuri run strongly on *post*-fixes rather than *pre*-fixes. The Yoruba has been called monosyllabic—which it may be in the way that some American languages are, *i. e.* sporadically.

In respect to the *value* of the classes, the Semitic and Berber, on one side, and the Kaffir on the other, may, each, be held as equivalent to all the others put together. Of the languages between the Mobba and Yoruba districts (both inclusive) the affinities are obscure from the linear character of the district they cover. To the south lies a *terra incognita;* to the north the intrusive Amazig. Hence, they have, as a general rule, possible (to say nothing of actual) congeners on their sides only, and, at the extremities of the range, only on one side.

In considering their stage of development we must criticize the African languages from some average series of examples rather than from either of their extremes, such as the Semitic languages on one side, and the Hottentot on the other. Those of central Africa, the Hawsa and Kanuri for instance, are fair ones to go by. They are, undoubtedly, on a higher level than the Polynesian, the Kelanonesian, and the American. They are this, at least, in the greater development of their numeral system, and, apparently, in many other details besides. No wonder. Great contact with the civilization of Europe and South-western Asia has given this as its result; in other words, new wants, new ideas, and an enlarged experience have played their part in Africa as elsewhere. In favour of any inherent superiority or inferiority of the African family African philology supplies no argument. The common-sense doctrine that the development of language follows the development of civilization, and that the development of civilization is

determined by the points of contact between different populations of different habitudes, is the true rule in all these matters.

Blood and language, upon a whole, coincide but slightly. In Northern Africa the difference is pre-eminently great. The Arab blood of the millions who speak Arabic is at a *minimum*. With the Berber this is largely, though to a less degree, the case. The Kaffir, too, must have encroached inordinately on the language represented by the Hottentot. Again, the Galla, the Mandingo, and the Fula are all encroaching languages. Lastly, with Africa as the land, wherein, of all others, slavery has been chronic, the intermixture, on that score only, must be great.

Of the numerous grammatical processes which (though found sporadically, in their fragments, or in their rudiments,) are, nevertheless, found in certain areas with a greater development than elsewhere, Africa is the country wherein three attain inordinate prominence, viz: (1.) internal change of vowels and accents which goes to the extent of altering even the syllables of the words in which they occur; (2.) the system of initial consonantal changes; and (3.) the system of prefixes. The first of these is Semitic, but not exclusively so. The second is Kaffir, Wolof, and much else besides. The third is chiefly Kaffir; but is found elsewhere. On the habit of the Galla and Kanuri to prefer post-fixes to prefixes I lay but little stress. The whole class is, in the main, agglutinate; but I lay little stress on this. With the exception of the languages of South-eastern Asia, represented by the Chinese on one side, and languages like the Greek, Latin, Sarmatian, and German on the other, agglutination is the rule rather than the exception all the world over.

CHAPTER LXXIII.

The Indo-European languages (so-called).—The Skipitar, Arnaut, or Albanian.

THE class which now comes under notice contains as primary groups—(1.) the Skipitar; (2.) the Sarmatian; (3.) the Latin and Greek; (4.) the German; (5.) the Keltic;—the Sarmatian containing the Lithuanic, the Slavonic, and the Sanskrit.

It is submitted that the Keltic division is of the ordinal value of all the others put together; the Skipitar of the ordinal value of the rest of the section; the German of the value of the Sarmatian and Latin and (or) Greek.

Oceanica, America, and Africa, touched Asia by either narrow isthmuses or a strait between two (comparative) points; a kind of contact which defined the lines of their affinities. Europe touches Asia along the whole long stretch of the Uralian range, not to mention the minor points of approximation at the Hellespont and the Crimean Bosphorus. Hence the lines of affinity may vary, *i. e.* there may be one for the north, one for the centre, one for the south. This, however, creates no difficulty. Omitting the fact of the Ugrian tongues being, to a great extent, European, the displacements effected by the Russian and Turk have so thoroughly obliterated everything that could ever have been transitional, that the line of demarcation between

our present class and our second is both broad and definite.

The encroachments and obliterations have been great. They, also, began early. The Herodotean Scythians, or Skoloti, show this for a part of the area. But it may also be inferred, for the remainder, by a consideration of the condition of Asia Minor at the beginning of the historical period. Over the whole of that peninsula the presumptions are in favour of a form of speech akin to the most southern and western of the Dioscurian group having been originally spoken. Still, there was intrusion, upon even this, by the languages of Persia, of Tartary, of Greece, and of the Semitic area. Nor was it one-sided. There is a fair amount of evidence in favour of Europe having projected itself eastward as well as of Asia having projected itself westward.

If we took the whole frontage between the two continents a case might be made out in favour of the nearest congeners of the most western of the Asiatic languages having been either Slavonic or Lithuanic; and, if we took up our line at the end of the notice of the Mordvins, such might be really the case. The Lithuanic and Slavonic, however, have such undoubted European affinities that, even if the conditions were equal, the language with which we now begin is the fit one.

This is the *Skipitar*, Epirot, Arnaut, or Albanian of Albania, with a harsh phonesis, and with (*inter alia*) a post-positional article. It was the language of the ancient Illyrians (in the Greek sense of the word); perhaps the language of the bulk of the Macedonians; a language, perhaps, of the whole of ancient Greece; and a language which was almost certainly spoken far to the north, the east, and the north-east of its present frontiers; in other words, it is a language which has receded.

It falls into two main divisions, the Tosk and the Gheg: is spoken beyond the boundaries of Albania, in Greece, in Calabria, and in Sicily, doubtless with varia-

tions in the way of dialect which have yet to be studied in detail. It is written by means of the Greek alphabet adapted to the Skipitar phonesis. Such, at least, is the common practice. There is, however, a second set of letters restricted to the town of Elbassan ; which, is, apparently, more of a cipher than a true alphabet. Hahn considers that it is of great antiquity ; possibly running back into the times when the spelling on the coasts of the Adriatic was Phenician rather than ordinary Greek. In my own mind it is founded on the Glagolitic. The national songs of the Albanians are numerous ; and one poet, at least, has written classically, *i. e.* as a man with an artificially cultivated taste and after Turkish and (at second-hand) Persian models.

Of the two main dialects it is the Ghegh which lies on the northern, or Slavonic, the Toski which touches the southern, or Greek, frontier ; the valley of the Skumbi, or Stirnatza, between Berat and Elbassan, being (there or thereabouts) the division between the two. In the Ghegh district the Mirdites are Roman Catholics. Of the Tosks, the Lyapid and Tshamid tribes are sub-divisions ; among which are numerous Christians of the Greek Church. The mass, however, of the Skipitar are Mahometans ; though the use of the Arabic alphabet is at a *minimum*.

CHAPTER LXXIV.

The Sanskrit.—Persepolitan.—Pracrit.—Pali.—Kawi.—Zend.

THE Sanskrit is the old literary language of India. Indian, however, as it is in respect to the country in which it was cultivated, the following short tables are amply sufficient to prove that its nearest congeners are the Sarmatian, the Classical, and, to a great extent, the German tongues of Europe.

They give a selection from its inflections—a *selection*. This means that those only are taken which, in form and name, run on all fours with either the Latin and Greek or the Lithuanic. By taking the Slavonic, or even the German, a similar result would have been obtained.

The Latin and Lithuanic best illustrate the substantives and pronouns; the Greek (with special reference to the conjugation in -$\mu\iota$) the verbs.

1.	bhavámi	*fui*	*buvao*	1.	bhavámas	*fuimus*	*buvome*
2.	bhavasi	*fuisti*	*buvai*	2.	bhavata	*fuistis*	*buvote*
3.	bhavati	*fuit*	*buvo*	3.	bhavanti	*fuerunt*	——

Upon the whole the Lithuanic is the nearest congener of the Sanskrit, and, after it, the old Slavonic; though, in asserting this, there is a certain amount of assumption. It is assumed not only that the Slavonic languages (especially in respect to their verbs) had a fuller inflection than they have now, but that that inflection delivered reduplicates, verbs in $-\mu\iota$, and (perhaps) augments, which, now, either no longer exist, or exist only in fragments. With the analogies of the Latin and Italian, of the Mœsogothic and English, &c., this is not too much to assume; indeed, it is what, either consciously or unconsciously, most philologues, when they are constrained to compare one language in a late with another in an early stage, do assume. The present assumption, however, is subject to the criticism of professed Slavonic scholars.

In the phonesis, especially with reference to the use of the sibilants rather than *k* or *g*, the Sanskrit is pre-eminently Slavono-Lithuanic.

If this be the case the original *situs* of the Sanskrit must have been in either approximate or actual contact with that of the Slavono-Lithuanic; nor is this a matter upon which there is much (if any) difference of opinion.

The Sanskrit, however, with its congeners, comes from India; the Lithuanic, the Slavonic, the Latin, the Greek, and the German, from Europe; and between the areas of the two groups there is a wide geographical interval.

Has the Sanskrit reached India from Europe, or have the Lithuanic, the Slavonic, the Latin, the Greek, and the German, reached Europe from India? If historical evidence be wanting, the *à priori* presumptions must be considered.

I submit that history *is* silent, and that the presumptions are in favour of the smaller class having been deduced from the area of the larger rather than *vice versâ*. If so, the *situs* of the Sanskrit is on the eastern, or south-eastern, frontier of the Lithuanic; and its origin is European.

As I know of no one else who maintains this hypothesis, and as the opposite doctrine of the Asiatic origin of the so-called Indo-European languages is dominant throughout all the realms of philology, I must be allowed to explain what I mean by it. I do not deny the fact, as it is usually stated, as a fact. It may be one in spite of any amount of presumptions against it. If sufficient evidence be brought forward in favour of it, I am prepared to take it as it is given; just as, upon sufficient evidence, I would believe that sixes with the dice might be thrown two, three, four, five, or any number of times running. The fact may be real; but it is against the chances. To assume it, however, when there is nothing but the chances to go by, is illegitimate.

I may be wrong, however, in asserting the absolute non-existence of evidence; in other words, in holding that the presumptions are, really, all we have to go on. Upon this I am open to correction. I can, however, truly

say, that, if there be evidence on the matter, I have failed, after a careful search, to find it. What I have found in its stead is a tacit assumption that as the East is the probable quarter in which either the human species, or the greater part of our civilization, originated, everything came from it. But surely, in this, there is a confusion between the primary diffusion of mankind over the world at large and those secondary movements by which, according to even the ordinary hypothesis, the Lithuanic &c. came from Asia into Europe. A mile is a mile and a league a league from whichever end it is measured, and it is no further from the Danube to the Indus than it is from the Indus to the Danube. In zoology and botany the species is always deduced from the area of the genus, rather than the genus from the area of the species ; and this is the rule which I go upon here. To the actual fact I do not absolutely commit myself—not, at least, in the present work, which troubles itself more about methods than results.

The fact of a language being not only projected, so to say, into another region but entirely lost in its own is anything but unique. There is no English in Germany. A better example, however, is found in the Magyar of Hungary ; of which no trace is to be found within some 700 miles of its present area. Yet the Magyar is not twelve hundred years old in Europe.

As to the *à priori* presumptions against a language being introduced from Eastern Europe into Western India, they are no greater than those which lie against one being carried from the Jaik to the Danube. No one derives the Fin tongues from Hungary ; though Hungary is the country in which more than half the individuals who use a Ugrian language of any kind, dwell. That this is an important fact is clear ; yet it is nothing when compared with the weightier ones connected with its *situs*. The Magyar stands in contrast with the languages with which it comes in contact. The languages

with which it stands in connection are at a distance. Where they are spoken, they form an order. Where the Magyar is spoken it forms a species.

The relations of the existing languages of India to the Sanskrit have but a slight bearing upon the question. They may, one and all, be her true daughters (though I maintain that none of them are) without the Sanskrit, on that account, being indigenous to the soil. Whether a language introduced from without take sufficient root to retain its identity for a thousand (or ten thousand) years, or merely take root enough to modify the original languages to such an extent as to give them the guise of its own descendants, is a question of degree.

As slight a bearing upon the question has the antiquity of the Indian literature. Those (with whom I unwillingly differ) who carry it high, only make the intrusion of the language in which it is embodied so much the earlier.

At the same time these doctrines, as they are commonly represented, are more for than against the common notion; in other words, they are not against it at all. As far as they are relevant they are favourable. Their relevancy, however, is only apparent.

Treating, then, the Sanskrit in Asia as (with an allowance for its difference of antiquity) the Magyar in Hungary or the English in England might be treated, and taking its locality as we find it; the nature of the memorials in which it has come down to us, along with the question of their date, locality, and authorship, presents itself. And here the uncertainty is great.

The few remains that have either date or place are the best to begin with.

Of the remains of any language belonging to the same class with the Sanskrit with an approximate date, the earliest are the cuneiform inscriptions delivering the edicts of the kings of Persia, ranging from B.C. 470 to B.C. 370—there or thereabouts. Of these

the following specimen is from the tomb of Darius at Naksh-i-Rustam, according to the text and translation of Sir H. Rawlinson :—

1 Baga wazarka Auramadzá, hya im
2 ám bumim adá, hya awam asm
3 ánam adá, hya martiyam adá, h
4 ya shyátim adá martiyahyá,
5 hyá Dár(a)yavum khsháyathiyam ak
6 unaush aivam paruwanám khsháyath
7 iyam, aivam paruwanám framáta
8 ram

The Great God Ormazd, (he it was) who gave this earth, who gave that heaven, who gave mankind, who gave life (?) to mankind, who made Darius King, as well the King of the people, as the lawgiver of the people.

It is the edicts of the Achæmenian kings which this language more especially embodies. In respect to its structure it is closely akin to the oldest Sanskrit. There is no evidence, however, to it having ever been spoken in India, nor yet in the east of Persia. It is on the Kurd frontier and in Fars that samples of it most abound. It is only in inscriptions in the cuneiform character that it is found. Whether these give us the oldest compositions, in the class of languages to which they belong, is uncertain. Most Sanskrit scholars would say that they do not. It is certain, however, that they are the oldest compositions that bear a date.

The next in order of time is the language of the Caubul coins, in an alphabet written, like the Semitic ones, from right to left ; the latest of which are (so to say) overlapped by a second series for the same parts in an alphabet (like the Devanagari) written from left to right. The vocabulary they exhibit is, of course, of the scantiest.

Later than the earliest, but earlier than the latest of the coins, are certain inscriptions bearing the name of *Priyadasi*. We may call them the Priyadasi Edicts. There are four of them—all with the same text ; the

most western of which is the famous Kapar-di-giri inscription from Caubul, the most eastern in Orissa. One in Ceylon is said to exist, but has yet to be discovered.

All these have dates—the coins, that of the kings whose approximate superscription they bear, the Priyadasi edicts, not only the name of Priyadasi (which would be but little), but that of one of the Antiochi. Hence, roughly speaking, we may refer them to the early part of the dynasty of the Seleucidæ.

After these, there are no definite dates until after the Mahometan conquest.

The conquerors found a literature in a native language and a native alphabet—a native literature and a rich one. As such it was, of course, older than their own conquest. How much? The historical portion of this literature was of the smallest, and in what there was of it there was but a *minimum* amount of chronology and topography. Everything in this way was, to say the least, indefinite. Still, there were the real dates of the edicts and the coins, and there were certain names in certain Indian works which could be connected with these important landmarks. There was especially the name of Chandragupta, which was identified with the Sandracottus mentioned by Justin, and, though the true dynasty of consecutive Gupta kings with a real historical coinage lived several centuries later, the identification has passed muster, and serves as an instrument of criticism. The process, then, by which approximate dates are found in Sanskrit is to find some one mentioned within or near the historical, or Mahometan, period, who is stated to have stood in some relation to some one else, who stood in some relation to some third person, who was a contemporary of Chandragupta, who was Sandracottus, whose date is known.

I give this train of argument—the argument which

rests upon external, as opposed to internal evidence, and which, as such, is historical rather than inferential—as I find it. It has been worked with skill, ingenuity, and learning. The facts, however, which it deals with are of the inconclusive kind here indicated.

Similarly inconclusive, though obtained by equal learning, ingenuity, and skill, are the results got by inference. In form (or language), in matter, or both, certain systems of literature, philosophy, or religion not only differ from each other but differ as older and newer. As factors in the appreciation of these differences approximate measures of both the differences themselves, and the average rate of change are required ; that of the latter being founded upon a careful induction from the phenomena presented by languages, religions, and philosophies during periods of change, over the whole world, sufficiently long and sufficiently diversified to give a constant. Add to this the avoidance of the confusion between changes in consecutive time and concurrent changes (by the neglect of which we may make the present Islandic older in the way of actual date than the Danish of the fifteenth century) and a provisional approximation is the result. That more than this is claimed by almost every Sanskrit scholar is well-known.

The difference, however, finds no support on the part of the present writer ; who simply admits that in Sanskrit there is something more archaic than something else.

The term *archaic* is used with a purpose. It means antiquity ; an ambiguous or equivocal antiquity ; one of two kinds, as the case may be. It may mean antiquity in the way that Chaucer is older than Addison, or it may mean antiquity in the way that the Icelandic newspaper of the present week is older than the Copenhagen Morgenblad of the year 1820. Chronological, serial, or linear, antiquity is one thing ; developmental, dialectual, or concurrent antiquity is another.

Still the comparative archaism is a fact. Apply it, and—

The Sanskrit falls into two divisions—

1. The Vedaic of the Vedas, older in language and matter than—

2. The Non-vedaic, classical, or ordinary, Sanskrit. This falls into sub-divisions. There is a Sanskrit drama, and, just as in Molière, certain characters talk Gascon or something else equally provincial and French, so do certain *dramatis personæ* of Asia talk a certain amount of something equally provincial and Indian. These popular dialects are called *Pracrits*.

If we call everything that is neither Vedaic nor classical Sanskrit a Pracrit, a language of, at least, equal political importance with the Sanskrit itself, the *Pali*, is one.

The Pali is the language of *Buddhism;* be it that of the Singalese, of the Burmese, the Siamese, the Mon of Pegu, the Kambogians, the Tibetans, the Mongols, or the Mantshus; the Sanskrit being the language of *Brahminism.* We may call it a Pracrit, if we will, but we can scarcely do so if we attach to the term even the slightest notion of disparagement.

The alphabet of the Sanskrit—Vedaic and Non-vedaic—is the Devanagari; no specimen of it being older than the Mahometan conquest. The later Puranas which are truly Sanskritic, are, as far as form goes, later still. Hence, the triple alternative (if the phrase may be used) which was suggested when the Hebrew of the Holy Scriptures was under notice has its application here. It is merely referred to. It is always repeating itself; and it will again have an application when we come to Greece.

The Sanskrit, as we have it, has a great number of words which re-appear in the existing languages of India. It may be that they are all of Sanskrit origin, and all borrowed by the modern tongues. It may, also, be that

they are all Indian, taken up into the Sanskrit. Either generalization is exceptionable. Each word must be tried on its own merits.

The Sanskrit has a series of true aspirates (*i. e.* aspirates like the *ph*, *kh*, and *th* in *hap-hazard*, *ink-horn*, and *nut-hook*, rather than false aspirates like the *ph* and *th* in *Philip* and *thin*) which are wanting in its European congeners, but which are common in Tibet and the Himalayas. Did it take these in India, or did its western congeners lose it in Europe? I cannot say. I can only say that the doctrine that the Sanskrit takes nothing, whilst other languages lose what they may fail to have in common with it, is illegitimate.

The Sanskrit has a series of cerebral letters common in Southern India but foreign to Europe. To these apply the preceding question.

The expositors of the Sanskrit language are the Brahmins. The evidence, however, that they are the descendants of the men with whom it was vernacular is deficient. They are known to have kept their blood pretty pure for a certain number of centuries. They are, however, presumed to have kept it so for a much longer period, because the documents for which they are repositories enjoin that such should be the case. The importance of this is shown in the question of phonesis. The purity of the source from which the present stream of Sanskrit learning flows has never been shown; and except under undue assumptions, by which alone the objection may be rebutted, the facts of the phonesis are against it.

The cultivation of the Sanskrit language is partial. In poetry with compounds after the fashion of the Orphic hymns it is rich. It has a code of laws, and innumerable logographies. The matter of its philosophical works has commanded attention which it has not disappointed. Its grammar is a very remarkable phenomenon—so remarkable as to have reflected many of its merits on the language. There are approaches to the lan-

guage of common life in the drama. For real common life, however, for history and oratory, it gives us nothing. From what we know of it, it can hardly be realized as a truly vernacular and generally spoken language.

If this be the case, it has no true vernaculars as its descendants: indeed, it is only known to us as a language of either a few dialects or a few stages, with a purely literary cultivation (and that partial), with an imperfect claim for being accurately handed down, with a questionable date, and an uncertain locality.

On the other hand, it gives us a third member to that class of languages which, up to the time at which it began to attract notice, consisted only of the Latin and the Greek, with, perhaps, the addition of the Mœso-Gothic —a class wherein true inflection is at its *maximum;* this inflection being, in the Sanskrit, exhibited in an independent and native grammar. To this add its great political value as the language of Brahminic India, and the mystery connected with its localization in Asia is enhanced by its real importance; which is great, but limited.

After a series of exceptions like the preceding, it is needless to add that the writer is (to say the least) adverse to the whole system on which the well-known merits and importance, as currently claimed for the Sanskrit, are based. That the whole tenor of his mental habitudes and aptitudes is against them is saying too much. There is nothing condemned in the preceding remarks which he has not, at one time of his life, supported. What they are opposed to are his rules of evidence. The fact may be all that the extreme Sanskrit scholars make it, provided the evidence make it so. Upon this, as an advocate (to draw an illustration from the common-sense of the English world at large as shown in the courts of law) he has no authority to speak. The facts lie in the Sanskrit language itself, of which he has no more cognizance than is shown in the foregoing statements. As a judge he has a voice less

important still. The knowledge of the facts and the law combined is, *à fortiori*, beyond him. Still more, *à fortiori* (he might say *à fortissimo*) is the private cognizance of any material *data* which are not vouchsafed to him, in common with the least Sanskrit-minded man in England, by the Sanskrit scholars themselves. His position is simply that (if he may use the word without presumption) of an intelligent jury-man, who, knowing that he is no judge, putting a wholesome distrust in the barrister, and ignoring anything which he may or may not know *aliunde*, simply looks to the evidence; feeling sufficient confidence in himself to trust his judgment in determining whether it bear, or do not bear out, the case. Upon this point, without condemning it, or (what is the same thing) only condemning it provisionally, he pronounces it insufficient for the present.

As far as he goes beyond this, and, instead of being satisfied with a merely negative condemnation on the score of insufficiency, ventures upon an approximation in the way of anything positive, he is not afraid of committing himself to the doctrine that, when philologues make the Vedas 3000 and odd years old, and deduce the Latin and its congeners from Asia, they are wrong to, at least, a thousand miles in space, and as many years in time. Of course, with views of this kind, he looks upon the Sanskrit as a language *towards* which, rather than one *from* which, we are to argue. We are to end, rather than begin, with it.

The last congener of the Sanskrit is the *Zend*, or the language of the Parsi Scriptures. It is written in the alphabet of the Sassanian inscriptions in a cursive form, and with the addition of the Sanskrit system of vowels. It was discovered in the last century by D'Anquetil Perron, among the Parsís of Bombay. Older in form than the Huzvaresh and Parsi, and more decidedly akin to the Sanskrit, it is written in a newer alphabet,

and it was discovered in the eleventh hour, and in India. The notion of its being anything but a genuine language (whatever might have been the case in the last century) finds, at present, but few supporters.

Perhaps, however, certain loose generalizations, concerning what is called the impossibility of forging a language have had much to do with the opinions which are favourable to its antiquity. Fictitious languages, however, are entirely questions of more or less ; in which the nature of the subject, the skill of the forger, and the acumen of the critics are the factors—just as they are in any other forgery. This, however, is merely a suggestion. I put a courteous, and otiose belief in the teaching of the special Zend scholars ; though I know of no one amongst them who has fairly met the difficulties involved in the contrast between the *Ante*-Sassanian structure of the language and *Post*-Sassanian character of the alphabet, combined with the fact of the additions to the alphabet being, like the differentiæ of the language, Sanskrit from a Sanskrit locality.

In the following table the Kawi is the sacred language of Java, which, according to some, is Sanskrit with a mass of Javanese incorporated ; according to others, Javanese with so much Sanskrit superadded.

English.	Sanskrit.	Pali.	Kawi.
Man	manusha	manut	manusa
——	jána	——	jana
——	purúsha	burutsa	purusia

The following is Sanskrit from a Chinese grammar.

English.	Chinese.	Sanskrit.
He is	po'-po-ti	bhavati
They two are	po'-po-pa	bhavapa
They are	po'-fan-ti	bhavanti
Thou art	po'-po-sse	bhavasi
You two are	po'-po-po	bhavapa
You are	po'-po-ta	bhavatha
I am	po'-po-mi	bhavami
We two are	po'-po-hoa	bhavavak
We are	po'-po-mo	bhavamah
Man	pu-lu-sha	purushah
Two men	pu-lu-shao	purushau
Men	pu-lu-shaso	purushás
Of a man	pu-lu-sha-tsie	purushasya
Of two men	pu-lu-sha-pien	purushábhyám
Of men	pu-lu-sha-nan	purushánám.

It is called Sanskrit rather than Pali from having a dual number.

CHAPTER LXXV.

The Lithuanic Division of the Sarmatian Class.—The Lett, Lithuanian, and Prussian.

LITHUANIC means the languages of the group at large; *Lithuanian* the Lithuanian Proper or the Lithuanian of Lithuania.

The Lithuanic falls into three branches: (1.) the *Lithuanian* Proper, (2.) the *Lett*, (3.) the *Prussian*, or (as the language has been extinct for nearly three centuries) the *Old* Prussian.

The Lett is spoken in Estonia, Livonia, and Cúrland, as well as in some of the neighbouring Governments; the Lithuanian in Grodno, Vilna, and Kovno, and parts of East Prussia. The Prussian is known only through some Paternosters and a catechism of the sixteenth century.

The chief locality for the chief dialect of the Lithuanic is Samogitia.

Encroached upon by the Russian, the German, the Polish, and (perhaps) even the Estonian, the Lithuanian (with all its high philological importance) is a broken and fragmentary language, with only one author who has any pretension to the rank of even a minor classic; but with a large mass of simple popular poetry, little of which is older, in the way of language, than the date of the first collection. This was made A.D. 1745. Hence, there are no stages in the Lithuanian languages, a circumstance which largely subtracts from their value as a

philological study—which in other respects (especially from the affinities between the Lithuanic and the Sanskrit, not to mention others with the Latin and the Greek) is of the highest. Nor does it make up for this want of lineal history through either its local dialects or through its congeners, the Lett and the Prussian. I have met with the statement that the former of these stands in the same relation to the Lithuanian that the Italian does to the Latin—a statement of mischievous inaccuracy. In some points the Lett forms are the older, and throughout the languages the difference of development is but slight. The same applies to the Prussian: which is often called the *Old Prussian;* and, if we only compare the modern Brandenburghers with the ancient Lithuanians, the prefix is a good one. But it is of doubtful fitness if we look to the structure of the language. In some points the Prussian is really the Lithuanic with certain old forms: but in others it is a younger and more advanced language. It has a definite article, which the other Lithuanian languages, as well as their Slavonic congeners, want—an article which has grown, like the article in Greek, out of the demonstrative pronoun.

One language of the Lithuanic class is extinct; the population by which it was spoken having been permanently broken-up as early as the thirteenth century. This bore the name of *Jaczwing* (*Yatshving*), *Jatwag*, or something similar—according as the spelling of it was Polish, Russian, German, or Latin.

All that remains of this language is a few proper names. The external evidence, however, to its having been Lithuanic is sufficient.

The Lithuanian is written in Roman letters; and in an orthography for which the Polish has served as a basis. Unlike most other languages it ignores the principle by which an Englishman, in order to show that the preceding vowel is short, repeats the consonant which follows

(as in *pitted, flitting,* &c.), and has no double letters. It has, on the other hand, an over-abundance of diacritical marks in the way of accents, superfixes, and suffixes. One of these represents a sound which no longer exists, but which must have existed when the modification was first resorted to. The signs of *ą* and *ę*, originally represented nasals. At present, they are sounded as the ordinary *e* and *a*. A change, then, of some importance in the phonesis has taken place since the language was first reduced to writing.

The Lithuanic, as a language, is full of interesting points; though it may easily be imagined that its affinities with the Sanskrit have commanded almost exclusive attention. Its affinities with the Latin and Greek showing themselves every now and then, in unexpected words, are also remarkable.

It has an approximation to the post-positive article, *i. e.* it has a definite inflection of the adjective formed by the incorporation, as an affix, of the demonstrative pronoun. Thus *geras = good, geràm = to good, gero = of good;* whilst *the good, to the good,* and *of the good* are *geràsis, geramjam, gerojo,* the pronoun being *jis, jam,* and *jo.* On the other hand, except in the Prussian, there is no definite article, *eo nomine,* at all.

With a language so fragmentary as the one before us, everything connected with the question of its original diffusion is of value; and one of the points thus invested with interest is this same approximate post-position of the article. The four languages in Europe where it is most conspicuous, are the Rumanyo, the Norse, the Bulgarian, and the Albanian. That the Albanian lies both too far south, and too much *in situ* to belong to an area originally Lithuanic is denied by no one. That the language of the Dacians, before the Roman conquest, was Lithuanic, is held by many, and that on pre-eminently good grounds; its relations to the Scandinavian being more doubtful. Elsewhere the present writer has

given reasons for holding that before Scandinavia became German it was, to a great extent, Prussian or Lithuanic —in other words, he has given reasons for transferring a great many of the conquests of the Goths, usually given to the Germans, to the Lithuanians; who he holds were, at one and the same time, the Gothini of the Marcomannic frontier and the Gothones of the Amber coast; their area being, then, continuous—*i. e.* extended from the most southern point of their present occupancy in Grodno to Gallicia. If so, of the two languages mentioned by Tacitus, one as *Gallica*, the other as *Britannicæ proprior*, the former was *Galician*, the latter Prussian (*Pruthenian*); or, as the informants of Tacitus (who, on other grounds, seem to have been Germans) would have called it, *Pryttisc.*

At present the coincidence between the blood and the language in Lithuania is only partial. The Letts, at least, have encroached on the Fins.

The Lithuanic area, then, originally lay southwards; its direction being from south to north; the south being the quarter in which it has, itself, been the most displaced.

The Lithuanic area lies east of the Slavonic. This is noted because its present relations to the Russian and the German conceal the true character of its early *situs*. The German touches it in the Baltic provinces: the Russian stretches far beyond it into Asia. Both, however, have spread within the historical period. Meanwhile, on the Polish frontier there is an approach to the original relations; whilst, of all the Sarmatian languages, it is the Lithuanic which is in the fullest contact with the Fin.

CHAPTER LXXVI.

The Slavonic Division of the Sarmatian Class.—The Russian, Servian, and Illyrian.—The Slovak, Tshek, Lusatian, and Polish.—The Kassub and Linonian.

THE most eastern, and, by extension, the most northern member of the Slavonic division of the Sarmatian class, the *Russian*, is spoken from Galicia to Kamtskatka, with a *minimum* amount of variation; the reason for this lying in the recency of its diffusion. In the older portions of its area, however, there is the distinction between the *Little* Russian of Galicia and the Ukraine, and the *Great* Russian of Muscovy. This latter, again, falls into subdivisions, of no great value, except so far as they supply information concerning those populations of Ugrian origin whose mother-tongue was displaced by the Russian—for in Russia the coincidence between the blood and the language is, by no means, close. In Archangel and Olonets the Fin words are (I believe) more numerous than elsewhere; and, then, in the Susdalian dialect to the east of Moscow. In Kursk they would probably be found if looked for; and *à fortiori*, in the districts further east. In the White Russian of Smolensko and the Black Russian of Grodno Lithuanian elements may be expected. With the exception, however, of the Malo-Russian, Ruthenian, Russinian, Rusniak, or Little Russian, rich in national songs, none of the dialects of Russia have commanded much attention.

From its nearest congener, the *Servian*, the Russian

is separated by the Wallachian—the Servian, like the Malo-Russian, rich in national songs, being the chief representative round which we may group the Bosnian (spoken by a Mahometan population, and, perhaps, written in the Arabic alphabet); the Herzegovinian; the Montenegrin (where *h* is used in the place of *g*); the Croatian; and the Slavonian Proper of that part of Hungary so-called.

The alphabet of the Servian and Russian is that of the old Slavonic translation of the Scriptures, attributed to the missionaries Methodius and Cyrill. Its basis is the Greek.

The exact dialect which the old Slavonic represents is doubtful.

A priori, and upon geographical grounds, the Bulgarian has the best claims. The Old Slavonic wants, however, the chief Bulgarian characters; a fact which transfers the claim to the Russian or the Servian. Considering, however, the great displacement that has taken place in these parts, it may easily be the descendant of some division or sub-division now extinct.

The *Illyrian* or *Slovenian* of Carinthia and Carniola, closely akin to the western dialects of the Servian group, is the language of the Roman rather than the Greek, church, and is written in Roman characters rather than in an alphabet of Greek origin. I can give no account of its dialects, nor of the links which connect it, with the Croatian and Dalmatian into which it probably graduates. One of these was originally written in an alphabet akin to the Old Slavonic and called the Glagolitic.

In the northern and north-western counties of Hungary, separated from the Poles and Rusniaks of Gallicia by the Carpathians, and from Croatia, &c., by the intrusive Magyar, the *Slovak*, with a *minimum* amount of literary culture, is spoken—the language of Moravia or Bohemia being preached. Into the Moravian it, probably,

graduates ; the details of the Moravian dialects being unknown. The common *Moravian* language differs from the Bohemian in little except name ; the native name for the Bohemian being *Tshek*.

The *Sorb*, *Serb*, or *Sorabian* of Lusatia, and a part of the circle of Cotbus, intermediate to the Bohemian and the *Polish*, falls into two dialects—a Protestant dialect to the north and a Roman Catholic dialect to the south.

The *Kassub* and the *Linonian* (extinct) are fragmentary forms of a near congener of the Polish spoken in Pomerania and *Lune*burg.

The Sarmatian languages may easily have their inflectional character (by which is meant their approximation in the way of stage to the Latin, Greek, and Sanskrit) overvalued. Take their declensions and compare, or contrast, them with the English or Italian, and they look like languages of the classical, rather than the modern, period. Their conjugation, however, by no means, bears out this inference. Taking, however, this view, we must disconnect the participle from the verb, and treat it as a noun ; for the Lithuanic, which has dropped, or is dropping, even the signs of the third person, is pre-eminently rich in participles. Like most other languages, however, these are in different degrees of development in different parts ; a fact which, except with extreme languages like the English on one side and the Latin on another, should caution us against any general predications of *old* or *new*, *synthetic* or *analytic*, and the like, as terms applied to languages in general.

Though it is scarcely safe to compare the Sarmatian tongues with the Latin and Greek, they are nearer the Latin and Greek stage than the Italian or English. Their nearest analogues, however, in this respect, are, the Icelandic and Anglo-Saxon. At any rate, it is unsafe to suppose that they are in so early a stage as to have lost

nothing: a fact which, in comparing them with the Sanskrit, is important. We must think what they were when they had a full conjugation of verbs in -$\mu\iota$, and a system of reduplicate perfects (the latter being a phenomenon which we should never have known to have been German if it were not for the Mœso-Gothic); and what the Sanskrit would have been if it had come down to us after these had (as in the newer German and Latin tongues) been dropped.

The phonesis of all the Sarmatian tongues is peculiar. Less vocalic and liquid than the Greek, they are pre-eminently sibilant. They are this; though their orthography exaggerates their sibilancy. In separate sounds, indeed, they are scarcely richer than the English or Italian; but they do what both those languages eschew. They combine two. To the *ch* in *chest* they will prefix the *sh* in *shire*, so as to give the combination *shtsh*. All this disguises their Latin and Sanskrit affinities. As many of these sibilants represent a *g* or *k*, preserved in German, Latin, and Greek, they must be considered, in this point, at least, as new rather than old. However, as has been stated, they are new in some points, old in others. The oldest Slavonic is not old in the way that Latin is old as compared to Italian. It is rather old in the way that the Mœso-Gothic is old as compared with the Anglo-Saxon—if, indeed, it be this. Still, *Old* Slavonic is the name for the nearest congener of the Russian, Servian, and Bulgarian in its oldest form.

In parts of Poland, in Lusatia, in Bohemia, and Moravia, in the Slovak parts of Hungary, in the Ruthenian parts of Gallicia, in Carinthia, Carniola, Croatia, Bosnia, and Servia, the blood and language coincide. In Muscovy, or Great Russia, the blood is largely Fin.

The original *situs* and direction of the Sarmatian languages now comes under notice. How far did they reach eastwards? How far did they reach northwards?

This depends upon the original extent of the Ugrian

area. For other reasons besides those suggested by the mere similarity of name, I imagine that it may in (say) the time of Herodotus, have stretched as far as Minsk and Pinsk; its southern districts being overrun by intrusive Scythians, or Skoloti—ethnologically Turks. Along the Baltic we may carry it, even at the beginning of the historical period, to the frontier of East Prussia; and upon a few slight facts, at a still earlier period, to the Elbe. This, however, is a point which I do not press. I only remark that if I brought it to the Weser, or the Rhine, I should not be supporting the Fin hypothesis which carries it all over Europe. What is suggested here is merely a question of more or less. That the Pomeranian Slaves, and the Lithuanian Prussians, were on the Baltic before the Christian era is nearly certain. I think, however, that they had reached it from the South, and that there were intruders there as truly as were the Scythians, at even an earlier period, in Southern Russia.

How far did they reach westwards? This depends on the area allotted to the Germans and the Kelts; points which will be considered in the sequel.

CHAPTER LXXVII.

The Latin and the Languages derived from it.—The Italian.—Spanish.—Portuguese.—French.—Romance—Romanyo.

If the views to which the writer committed himself in the last chapter, as to the antiquity of the Slavonic language in the Carnic Alps and the probability of its having extended as far westwards as Savoy, be accurate, we must suppose that, in the first instance at least, either the northern frontier of the class of languages to which the Latin belonged touched the southern frontier of the Slavonic, or that some intermediate class has been annihilated without leaving any sign whatever of its existence. To do this, however, is to assume phenomena unnecessarily.

Imagine, then, that (say) one thousand years B.C. the Slavonic and Latin frontiers touched each other, and that throughout the whole length of the latter—a doctrine which treats the Gallic of Cisalpine Gaul as intrusive and comparatively recent; a doctrine, however, which, though it connects the Latin far more closely with the Slavonic than with the Keltic (or indeed any other language except the Greek), by no means denies the existence of Keltic elements in it.

This, however, is a question connected with the analysis of the Latin language itself rather than with its geographical distribution.

Where the Slavonic ended and where the most northern congeners of the Latin, previous to the Gallic invasions, began is unknown. Neither do we know

what was the philological ethnography of Etruria before the descent of the Etruscans. When Latium first becomes known to us its area is eminently truncate, *i. e.* cut off abruptly on the north by the Tibur; beyond which lay the Etruscan. On the south lay the Volscian, and on the east and north-east the dialects of the Hernici and the Sabines, all three of which appear to have been other than Latin in the strict provincial sense of the term.

The Sabine led from the Latin to the *Umbrian*, wherein the differences were sufficient (the Umbrian being known to us from the Eugubine inscription) to either simulate, or constitute, a fresh language; how far the Umbrian extended beyond the Rubicon being uncertain. In Gallia Togata the intrusive Gallic, the Etruscan, and the (Slavonic) Venetian prevailed.

The third congener of the Latin for which we have any beyond mere glosses is the *Oscan*, known to us through the Bantine and other inscriptions. It was spoken in parts of Samnium and Campania; and probably graduated into the Latin through the Volscian, and into the Umbrian through the dialects of the Peligni, Vestini, and Piceni.

Of the languages of the south of Italy more will be said in the sequel. Among those in the centre of the peninsula, it is manifest that, before the spread of the Latin, the dialects were numerous, well-marked, and in two cases, at least, of sufficient importance to pass as separate substantive languages.

Of the Latin Proper the history, as compared with that of the Greek, begins late: the remains of what may be called the Latin of the Early Republican period being scanty. The details of the changes which took place during the lifetimes of Cæsar and Cicero, and which give us the difference between Virgil and Horace on one side, and Catullus and Lucretius on the other, are obscure; and are, perhaps,

connected with the orthography rather than the language itself. This, however, has now taken its literary, classical, and standard form; and, unfortunately, it is in this form alone that it has come down to us. The analogue of the classical Latin is not the Greek language *en masse,* but the Greek of the Attic, the Ionic, or some single dialect. The language of the cultivated classes of Rome may have differed from the vernaculars of its immediate neighbourhood as the Florentine of Dante differed from the dialect of the nearest Apennines, or as the Athenian of Pericles from that of the neighbouring Megara. The local dialects of the Latin are known less than those of the Greek, and of the common language of the lower Romans and of the army we know nothing. Yet to this rather than to the classical Latin were those forms of speech out of which the modern derivatives of the Latin have been developed, in all probability, akin.

These derivative languages are, roughly speaking, the Italian, the Spanish, the Portuguese, the French, the Romance of the Grison Cantons in Switzerland, and the Rumanyo, or Roumain, of Wallachia and Moldavia. Of these, the last alone is isolated. The others all touch each other on their frontiers. How far they graduate into each other will be seen as we proceed.

In the growth of the modern languages out of the Latin three questions command attention—

1. The condition of the Latin itself, both in respect to the stage of its development, and the class of individuals by which it was introduced:

2. The language or languages with which it came in contact:

3. The changes which have subsequently taken place; especially with reference to the introduction of foreign elements.

In the history of *all* mixed languages these three elements must be recognized. In the Latin, however, and

its derivatives the phenomena with which they are connected are to be studied on a great scale.

The Etruscan, and its own immediate congeners, such as the Sabine, and the Volscian, were the first languages and dialects other than Latin in the limited sense of the term upon which the Latin of Latium encroached—then it touched the Gallic of Cisalpine Gaul and Liguria, the Euganean and Venetian dialects of (?) the Slavonic, the Umbrian, the Oscan, the Greek of the southern extremity of the peninsula, and, perhaps, certain offshoots of the Epirot, Illyrian, and Dalmatian from the opposite side of the Adriatic in the parts between Mount Garganus and the Iapygian promontory. Extended to Sicily it came in contact with the Greek of the colonies, as well as with the original language of the island (so far as it was spoken at all); which was probably Greek, though of a peculiar kind. In Sardinia and Corsica it is difficult to say with what vernaculars it met. They may have been, like itself, Italian. They may have been Gallic, Slavonic, Iberic, African. They may have been some or all of these: dashed, perhaps, with intrusive Greek and Phenician. In Spain, the Keltic and Iberic languages were spoken widely; and, in special localities, the Punic of Carthage along with, perhaps, the Numidian, the Mauritanian, or some other (? Amazig) language of Africa. In Gaul there was the Iberic on the south, the Keltic on the north, and, perhaps, along the Rhine some German; and in Savoy (by hypothesis) some Slavonic. In the Grisons I believe the basis to have been by no means Keltic, but a near congener of the Etruscan; and (as such) Slavonic. That Slavonic was the chief language of Pannonia I have no doubt; though I would not say that Lithuanic forms of speech were wholly wanting. In Dacia I believe that the two existed concurrently: possibly in concurrence with a southern offset of the Scythian—a doctrine for which I have given my reasons elsewhere.

The changes that have subsequently affected the several portions of this area belong to general history rather than to comparative philology. So do the details of the conquests of Spain, Gaul, Dacia, and the like. Between the first and last of these there was an interval of more than four hundred years; and between the character of the different settlers there was a corresponding difference. Dacia, the last to be reduced, was the first to be given up. Nevertheless (as already stated) the Wallachian and Moldavian of the present time is a daughter of the Latin.

Every language that has grown out of the Latin is either decidedly Latin or something else; *i. e.* it is either Latin or French, Latin or Italian, and the like. In other words, there is no such thing as an equivocal or ambiguous language. The earliest French, the earliest Provençal, the earliest Italian, are just as Italian, Provençal, or French as are the latest. In no sense of the term can any of them be called Latin or even Semi-Latin. The Sardinian is believed to have the best claim to this name: but it has only an imperfect one. It is essentially a derivative of the Latin and not the Latin itself.

This absence, however, of intermediate forms is only subjective, *i. e.* it rests upon our want of *data* rather than upon any real fact. The Latin served for the little writing that was wanted so long after it had ceased to be spoken as Latin that every one of its modern descendants may reasonably be supposed to have undergone notable modifications long before the earliest record of them. This want of *data* for the French, Italian, and their congeners during the period between the last days of the pure and simple Latin and the eleventh century (the date of the earliest Provençal compositions) is the great desideratum in the philological history of this great language—in other respects so prolific in valuable details.

That it is the Latin, *eo nomine*, rather than the Umbrian, the Oscan and their congeners, out of which the modern dialects of the Italian in Oscan, Umbrian, and similar localities have grown, is a reasonable presumption: though it is possible that the Oscan and Umbrian, &c., if known in their full details, might fairly be considered to have been the direct progenitors of some of them. Upon this, and its allied questions, much close thinking is wanted—all the more because what may be called the break-up of the Latin language is the great field for the study of all similar break-ups.

In a notice of the numerous and well-illustrated dialects of modern Italy it is convenient to begin with:—(1.) The Sicilian, (2.) The Calabrian, (3.) The Neapolitan, and (4.) The Roman: to which we may add the dialects which (whatever they were originally) are so modified by the influences of the literary Italian, or Florentine, as to be independent of the dialects of the districts around them. This means, in general, those of the towns; a difference recognized by the admission of a Lingua Urbana and Lingua Rustica. The former, as a general rule, means the language of the towns; every one of which is more Italian, even when beyond the proper Italian boundary (a term which will soon make itself understood) than the dialects of the parts around it.

In Tuscany the difference between the rural and urban dialects is at its *minimum*.

Not so, however, in the district circumscribed by the Alps, the Apennines, and (there or thereabouts) the drainage of the Foglia. On the south of this area those strong characteristics which distinguish the literary Italian from the French of Paris on the one side, and the Romance of the Grisons on the other, suffer diminution.

All these dialects are called by Biondelli *Gallo-Italian*, and whether we attribute the name to their belonging to that part of Italy which constituted Cisalpine and Cispadane Italy (Gallic districts) or to the occurrence of French characteristics in the existing dialects, the name (except so far as its compound form makes it cumbrous) is a fair one. It falls into families. (1.) the Piedmontese; (2.) the Lombard; and (3.) the Emilian, these latter lying on the line of the Via Emilia; just as, in England, we might make a group of the dialects lying along the whole, or a part, of the Watling Street. The classification is definitional; in each case, however, it is specially stated that the continuous dialects graduate into each other. A little alteration, therefore, enables us to convert the arrangement into a typical one, the arrangement itself being natural.

To this, add the Ligurian family on the one side, and the Venetian and Carnic on the other; the former giving the Lingue Rustiche for Genoa, the other the Lingue Rustiche for Venice and Fiume. The extreme members of this latter graduate into the Romance; and it is because some of the north-western members of the so-called Gallo-Italian do the same that I make the very slight objections which I *do* make to either the name or the class.

The Emilian dialects which come nearest to the Tuscan and Ligurian in structure seem to be those of the frontier. Of these the following extracts from the Parable of the Prodigal Son (Luke xv.) in the dialect of Bobbio may serve as specimens.

Bobbiese.

11. Un òm u gh' aviva dü fiö;

12. Al pü giùvan d' lur l' à dit so pàdär; Papà, dem la part di ben ch a m' tocca; e lü u gh' à spartì la sostanza.

13. Da lì a pochi dì, miss tütt insèm, al fiö minùr, u s'n' è andàt an l' un pais luntàn, e l' à consümà tütt al fat sò in bagùrd.

14. E cmà l' è stat nett dal tütt, u gh'è vnü na gran caristia in l' quel pais, e a lü u gh' è cmensà a mancà al nesessari.

15. E l' è andàt, e u s' è miss con un paisàn d' quel paìs, ch 'u l' à mandà a la sò campagna apriss ai pursè.

16. E u dessiderava d' impinìss la panz a dle giande ch 'i mangiàvan i giugnèn ; ma nsün gh' in dava.

As we move northwards the dialects of Mirandola and Mantua take us into the Lombard and Venetian areas ; while the Broni leads to Piedmont.

The Lombard family falls into two primary divisions, the western and the eastern, the former represented by the Milanese, the latter by the Bergamasco. Here, as before, I shall take more special cognizance of the Alpine varieties.

The Valteline and Ticino dialects are nearly as much Romance as Italian.

Ticinese (Val Maggia).

11. U jera un um con dü tosói ;

12. El piü piscèn de gnist l' a dič al padri ; atta, dèm al mè part da quel che m' toca ; e lü l' à fèč i divisivi e u gh' l' à dèci.

13. Da li a poc, l' à ramassào el fač sù, e u s' n' é nèč in pais da lunż, e l' à raffabiào tütt coss vivènd da pörc.

14. E dop ch' l' à biü fèč nèt, l' è vegnü in quel pais una gran carestià, e l' à comenzào a senti la sgajosa ;

15. E l' è nèč, e l' à scercào aprèss a un sciór ì da quel pais, e quest u l' à mandào al bosc a cürà i pörč.

16. E u scercava da mangià i giand, ch' à mangia i pörč : ma i un gh' dava gnanc da quìi.

Valtelinese (Val Pregallia).

11. Un òm veva diü fì ;

12. A plü giûvan dgét con sè bap : Bap, dam là mè pärt de roba ; ä 'l lur špartit i sè ben.

13. A poc dì drè, cur ch' al plü güivan vet tüt quant robacä, al get davènt in ür päés lontän, ä là 'l dissipàt la sè roba, menànt na vita dešmresüräda.

14. Ä cur ct 'el vet tüt fat andäal nit na gran famina in quel päés, ä 'l šcomanzàt ä sentì la misèra ;

15. Alua 'l gét, ä s'metét äl servisei pet' ün da qui dal päës, ch' it mandàt in t' i sì fond ä cürä i porč.

16. Ä 'l vés dgiü güdgènt da s' podè saziä da quel ch' a mangiävan i porč ; ma nägün n' i am deva.

The dialect of the valley of the Bormio is peculiar ; it having constituted a separate estate upon certain

conditions; one of which was to have nothing to do with the men of either Ticino or the Valteline.

Bormio.

11. Un òmen el gh' avéa döi fiöi ;

12. E 'l plù gióen de quì al gh' à dit al pà ; Pà, dam la part de roba.

13. E poc dì dop, mess insema tot, al fiöl plù gióen l' è gi in páes lontàn e lì là sciòlt al fat sè, a far al putanèir.

14. E popo che l' a avù consumà tot, l' è vegni fòra una gran penùria in quel paés, e l' à scomenzà a sentir la misèria :

15. L' è gi, e 'l s' è metù con un de qui de quel paés, ch' el l' à mandà fora in un sè löc a past coi porcèi.

16. E 'l desideràa de impleniss ol sè ventro deli giande, che i mangiàan i porcèi ; ma nigùn i gh' en daàn.

The Bergomasco is one of the most marked dialects of Italy.

Bergomasco.

11. Òn òm el gh' ia du fiöi ;

12. E 'l piö zùen de lur l' à déč a sò pàder : Tata, dèm la porsiù de sostansa ch' el me toca ; e lü 'l ghe dividè la sostansa.

13. Dopo poc dé, ol piö yùen l' à regondit töt ol sò, e l' è 'ndač in pais lontà, e là, l' à dissipàt quat al gh' ia a viv de barachér.

14. E dopo ch' el s' è majàt töt ol sò, al s' è, fač in quel pais öna carestéa gajarda, e 'l comensè e èss al bisògn ;

15. L' è 'ndač doca a tac-àss a ü benestànt de quel pais ch' el l' a mandàt fò 'n da sò campagna a fà pascolà i porsèi.

16. E là íl desideràa de impieniss la pansa di giande ch' i mangià a i stess suni ; ma nissü gh' en dàa.

The rustic Brescian from the Val Camunica is as follows.

Brescian.

11. Ön om el gh' ia du matèi.

12. E 'l piö zùen de lur el gh' à dit al parc ; Bubà, dam la part de la sostanza che m' toca : e lü l' à düdit a lur la sostanza.

13. E poc dé dopo, el fiöl piö zuèn, töt sö töta la so roba, l' è 'ndàt en d'ün pais lontà, e là l' à consömàt el fat sò a godisla.

14. E dopo i consömàt töt, el gh' è gnit öna gran caristià en quel pais, e' lü l' a scomensàt a pati ;

15. E l' è 'ndàt a ier con giù de quel pais, ch' el'l' à mandàt en d' öna sò campagna a pasturà i porsèi.

16. E 'l gh' ia via d' empienis el vèter de le giande ch' i majaà i porsèi ; e nigù i gh' en dàa.

The sub-division of the Piedmontese family is into

three primary groups: (1.) the Montserrat on the south, which is especially stated to approach the Ligurian, (2.) the Piedmontese Proper on the east, and (3.) the Canavese on the north. But, besides this, there is a division of the Piedmontese Proper into the dialects of the comparatively level country and those of the Alpine district. I have no hesitation in calling this a cross-division, and in adding that it finds a place in the other two divisions, as well as in the Lombard, the Venetian, and the Carnic families. The extent to which the Alpine division is French may be got from Biondelli himself; the following contrasts being taken from him.

(1.)

Italian	padre	fratello	muojo	tocca
Piedmontese Propèr	pare	fratel	möri	toca
Alpine	pàire	fràire	mùero	tuòccia.

(2.)

Italian	peccato	capretto	cantare	calzare
Piedmontese Proper	pecà	cavrèt	canté	caussè
Alpine	pecià	ciabn	ciantàr	ciaussàr
French	péché	chevreau	chanter	chausser.

(3.)

Italian	detto	fatto	quanti	quinto
Piedmontese Proper	dit	fàit	quanti	riva
Alpine	dič	fač	quanč	giünč.

(4.)

Italian	i porci	i mei amici	le femmini	allegri
Alpine	lus cusciuns	muns amis	les femmes	allégres
French	les cochons	mes amis	les femmes	allegres.

(5.)

Italian	per levarsi	di ritornarmene	per godermi
Piedmontese Proper	pr levèse	d'artornèmne	pr gòdemla
Alpine	per se levàr	de m' entournàr	per me regiùi
French	pour se lever	de m'en retourner	pour me rejouir.

(6.)

Italian	andato	fatto	dato	mandato	stato
Turin	andàit	faìt	dàit	mandàit	stàit
Cureo	andèit	fèit	dèit	mandèit	stèit.

(7.)

Italian	mangiamo	andàvano	facevano	avevano
Piedmontese Proper	mangio	andavo	fasìo	avìo
Corio	màngien	andàven	fasìen	avìen.

(8.)

Italian	dirò	farò	porterò	custodiro
Valdieri	vai dir	vai far	vai portàr	vai gardar
French	vais dire	faire	porterai	garderai.

In the Vinadio the nasals prevail; as does the habit of laying an accent on the last syllable. As far as the specimens go, the pre-eminently French dialects are those of Graglione, Oulx, Viu, Ussèglio.

The Genoese has the sound of *ng* between two vowels, as well as the French *eu* and *u*. The word *lünha* = *luna* = *moon* is a sort of Genoese shibboleth.

Of the Piedmontese dialects those of Garessio and Ormea are pre-eminently Ligurian—being spoken on the frontier.

Less Italian than these, though, perhaps, not more French, is the dialect of the valley of the Soana, as spoken in Ingria, Ronco, Roncato, and Campiglia.

(1.)

Italian.	ha	avesse	viene	era	aveva	voleva	entrasse
Soana.	hat	üsset	vint	éret	avèit	volèit	intrasset.

(2.)

Soana.	füssent	crevàvont	cùcunt	donàvant	avànsunt.

Castelmagno.

11. Ün öme avia diü figi ;

12. E tu pü giöve da chisti à dič a sun pàire ; Pàire dùneme la part dia roba ch' me toca. E el à fač tra tur les part dies sostanses.

13. E papà car'che giùrn, büttà tut ensèm, lu figi pü picöt se n' è anà en te d' pais lögn, e isi a l' à consümà tut tu fač sio en d' porcheries.

14. E eart a l' à gü fini tutes es coses, gli es saglì na gran earestio en l'achét pais, e él à cumensà a patir lu fam.

15. En l'achést mentre gli es vengü en t'·la testa d'anàr trubàr ün sitadin d'achét pais, ch' a l' à mandà a gardàr i puerc.

16. Ea l'avia vöglia d'empirse ta tripa dles giaudes che mingiàven i puerc, degün guen donava.

Oulx.

11. Un òmme avie dus eifàns ;

12. Le plü žune d' iéllus di a sun pàire ; Pàire, dùname la purziùn de ben che me revén ; e ié lus à partašà le ben.

13. Còches žurs apré aièn tut rebatà le plü zuve garsrìn parti par l'éitrangi, par ün pai éilunia, e ithi u l' à dissipà sun ben en viven luxürïusmén.

14. Mè aprè ch' ul' à agü tut cunsümà, l' es sürvegü üne grande famine dins qué pai, ejé mèime u l' à cumensà a esse in besùn.

15. Alure u se n' èi anà, e u s' èi attaša a ŭn dus abitàn de qué paï, e setissi l' a mandà a sa mèisùn de campagne, par fä paisse lus cusciùns.

16. Ithi u déisirave rempli sun ventre de las cròfas che mijaven tus cusciùns, e nengü n' i en dunuave.

In Sardinia, with *su* for its definite article, and with its plural ending in *s*, we have, *inter alia*, the elements of, at least, as good a language (as opposed to a dialect) as the Portuguese is to the Spanish and the Danish to the Swedish, or *vice versâ*. It falls into dialects and sub-dialects ; the main divisions being apparently—

(1.) The Southern, represented in its Lingua Urbana by the Cagliari form of speech.

Ruth i. 1.

A su tempus de is giugis candu unu solu fiat autoridadi, est accuntessin unu grandu famini in sa terra. Eun omini de Betlem de Giudas fiat andau a biviri in su paisu de Moab cun sa mulleri sua e cun duus fillus.

Matthew ii. 1, 2.

1. Essendi duncas nascin Gesus in Betlem de Giudas a tempus de su rei Erodis, eccu chi benint a Gerusalemmi is Magus de orienti.

2. Narendi ; Aund'est su, ch' est nascin rei de is Giudeus ? poita nos heus bistu sa stella sua in s'orienti e seus benius a ad' adorai.

(2.) The Central Sardinian.

Ruth i. 1.

Ad sos tempos de unu juighe quando sos juighes guvernaiant, succedesit una carestia in sa terra. Et un' homine de Bethlehem de Juda sind' andesit pro peregrinare in sa terra de Moab, cum sa muzere sua et cum duos fizos.

(3.) The Northern Sardinian.

Matthew ii. 1, 2 (*Logudore*).

1. Essende edducas naschidu Jesus in Bethlehem de Juda in sas dies de su re Herodes, ecco qui sos magos dai s'oriente benzesint a Jerusalem.

2. Narzende : "Ue est su naschidu Re de sos Judeos ? hamus bidu s'istella sua in s'oriente, et semus bennidos a lu adorare."

Ruth i. 1 (*Tempio*).

Alu tempu d'un giudiei, candu li giudiei cuman daani, accadisi una caristia in la tarra. Un omu di Betlem di Giuda andesi a pilligrinà in l'incuntrata di Moab, cu' la mudderi e cu' li so' dui fiddoli.

The plural in *s* is, at least, a point wherein the Sardinian is Spanish rather than Italian.

Through its northern dialects, the Sardinian graduates into the Corsican.

Matthew ii. 1, 2 (*Corsican*).

1. Adunque essendu natu Ghiesù in Betlemme di Ghiuda, in tempu che regnana lu re Erode, eccu che i Maghi arrivonu da l'oriente in Ghierusalemme.

2. Dicendu: Duv' è quellu ch' è nalu re di li Ghiudei? Avemu vistula so setter nel' oriente, e semu ghiunti per adurallu.

Between the Provençal of Southern, and the French Proper of Northern, France, the Loire is generally considered the boundary. The forms of speech themselves are separate languages rather than dialects of any single one. At present the French has the prerogative. It was the Provençal, however, which was first cultivated. The following is the earliest specimen of it.

Oath of the King (A.D. 842).

Pro Deo amur et pro Xristian poblo et nostro commun salvament, d' ist di en avant, in quant Deus savir et podir me dunat, si salverai eo cist meon fradre Karlo, et in ajudha et in cadhun a cosa, si cum om per dreit son fradra salvar dist, in o quia il mi altresi fazet; et all Ludher nul placa nunquam prindrai uni, meon vol, cist meon fradre Karlo in damno sit.

Oath of the People.

Si Loduwigs sagrament, que son fradre Karlo jurat, conservat; et Karlus, meos sendra, de suo part non lo stanit; si io returnar non l'int pois, ne lo, ne nuls cui eo returnar int pois, in nulla ajudha contra Lodhuwig nun li iver.

Vaudois.

Luke xv. 11–15.

11. Un hom avia du fill;

12. E lou pi giouvon di à so paré, "Paré; donne-mé la part de bén que me bén." Et a l' i ha partagià seni bén.

13. E un poc apreu, quant lou fill pi giouvon ha agù tut rabastà, a se n' é anà forca ent un païs lengu; et laï a l' ha dessipà so bén en vivant ent la desbancia.

14. E apreu qu' a l' ha agù tut despendù, una gran fanina é vengùa ente quel païs laï : e a l' é arestà coun rén dar tout.

15. Aloura a se n' é anà, et a s' é buttà à patroun coun un di habitant d' aquel païs, que l' ha mandà ent seui poussés per gardâ li pueic.

Northern French.

Luke xv. 11–14.

11. Un homé avié dous enfans.

12. Lou plus pichoun diquét a son päiré, "Moun päiré, dounas mi ce qué mi reven de vouastre ben ;" Lou päiré faquet lou partagé de tout ce que poussedavo.

13. Paou de jours après, lou pichoun vendét tout se què soun päiré il avié desamparat, et s'en anet dins un pais fourco luench, ounté dissipét tout soun ben en debaucho.

14. Quand aquét ton arcaba, uno grosso, famino arribet dins aqueou päis, et leou, si veguét reduech à la derniero misero.

South-western French.

Luke xv. 11–14.

11. Ain homme avoüait deeux garohéons.

12. L'pus jone dit a sain père, "Main pere, baillé m' chou qui doüo me 'r 'venir ed vous bren," et leu pére leu partit sain bren.

13. Ain n'sais yur, tro, quate, chéon jours après l' pus tiò d' criés déeux éféans oyant r'cuélle tout s'n péritt main, sot' ain voye dains nâin pahis gramair toüon, dù qu'il échilla tout s'n argint ain fageant l' braingand dains chés cabarets.

14. Abora qu'il o eu tout bu, tout mié et tout drélé, il o ónu adonc dains ch' pahis lo ainn 'famaire cruüele, et i c'mainchouait d'avoir fon-ye d' pon-ye.

The Provençal is common to France and Spain ; for, between the Catalonian and the Castilian, there is much the same difference as between the French Proper and the Provençal. Indeed, the Catalonian is, really, Provençal spoken in Spain. Again—the Gallician of Spain is, in like manner, Portuguese—the difference between the Portuguese and the Spanish being, to a great extent, political. Throughout, however, the whole range the general phenomena are those of transition. In Liege the language bears the name of Wallon : and is, as we expect from its locality, an extreme form of the northern French. Contrasted with the French of Paris it is a different language. This, however, may be said of so many other dialects that it means but little.

Catalonian.

Luke xv. 11–15.

11. Un home tenía dos fills:

12. Yl mes petit diqué á son pare: "Pare, donaume la part quem toca de vostres bens." Y ell los repartí bens.

13. Y al cap de poehs dias, juntant lo fill menor tot lo que era seu, seu aná illuny á un país estrany, y allí dissipá tots sos bens vivint dissolutament.

14. Y quant ho hagné gastat, vingué una gran fam en aquella terra y comensá á patu miseria.

15. Llavors seu aná, y s'arrimá á un dels ciutadans d'aquella terra, qui l'enira 's sa granja á guardar porchs.

Spanish.

Luke xv. 11–15.

11. Un hombre tuvo dos hijos.

12. Y dico el menor de ellos á su padre: Padre, dame la parte de la hacienda, que me toca. Y èl les repartió la hacienda.

13. Y no muchos dias despues juntando todo lo suyo el hijo menor se fué léjos à un pais muy distante, y allí malroto todò su haber, viviendo disolutamente.

14. Y quando todo lo hubo gastado, vino una grande hambre en aquella tierra, y él comenzó á padecer necesidad.

15. Y fué, y se arrímó á uno de los curdadanos de aquella tierra: el qual lo envida á su cortijo á quardar puercos.

Matthew ii. 1–6.

1. Habendo pois nacido Xesús en Belen de Xudá reinando Herodes, vé aqué que uns magos viñeron do oriente a Xerusalem.

2. Preguntando: ¿ Ónde está o nacido rei dos Xudios? porque nosoutròs vimos en oriente a su estrella, e habernos chegada con fin de adorarlo.

3. Oíndo esto o rei Herodes, turbóuse, e consigo toda Xerusalem.

4. E chamando a todas os principes dos sacerdotes, e aos escribas do pueblo, purguntáballes ónde tiña que nacer o Cristo *ou Mesías.*

5. Ao cal eles responderon; en Belen de Xudá; que así se ten escrebido no profeta;

6. E ti Belen terra de Xudá, non eres certamente a mais cativa entre as principales vilas de Xudá; pois que é de ti que ten de salir o xefe, que goberne o meu pueblo de Israel.

Portuguese.

Luke xv. 11–15.

11. Hum homem teve dous filhos;

12. E disse o mais moço delles a seu pai, Pai, dá-me a parte da fazenda, qua me toca. E elle repartio entre ambos a fazenda.

13. E passados nào muitos dias, entrourando tudo o que era seu, partia o filho mais moço para huma terra muito distante n'hum paiz estranho, e lá dissipou toda a sua fazenda vivendo dissolutamente.

14. E depois de ter consumido tudo, succedeo haver naquelle paiz huma grande fome, e elle comaçou a necessitar.

15. Returoi-se pois dalli, e accommodou-se com hum dos Cidadãos de tal terra, Este poréin o mandou para him casal seu a guardar os pórcos.

Swiss and Protestant, the Grisons are separated from Italy; the language of the Grisons being called the *Rumonsch* or *Romance.* Its orthography, too, is German rather than Italian. So that it passes for a separate substantive language; as, in its extreme forms, it is. Except in name, however, several of the Italian dialects are Romance.

Of the Romance Proper, the two main dialects are—

1. That of the valley of the Rhine;

2. That of the valley of the Inn—this latter falling, at least, into the Upper and the Lower *Engadino.*

The elements subsequent to the Latin are chiefly German. The language upon which the Latin, chiefly introduced by the conquest of Drusus and Tiberius, encroached, was a near congener of the Etruscan. At the present time the Romance phonesis is largely Slavonic.

Romanese.

Luke xv. 11–15.

11. Ün hum veva dus filgs.

12. Ad ilg juven da quels schet alg bali; "Bab, mi dai la part da la rauba c' aud' á mi:" ad ed parchè or ad els la rauba.

13. A bucca bears gis suenter, cur ilg filg juven vet tut mess ansemel, scha tilá l navent en ünna terra dalunsch; a lou sfiget el tut sia rauba cun viver senza spargn.

14. A cur el vet tut sfaig, scha vangit ei en quella terra ün gronæ fumaz: ad el antshavel a ver basengs.

15. Ad el mà, a sa plidè cun ün burgeis da quella tetra: a quel ilg tarmatet or sin ses beins a parcherar ïls porcs.

Engadin.

Luke xv. 11–15.

11. Un crastien haveiva dos filgs.

12. E 'l plü juven d' els diss al bap, "Bap, da 'm la part dalla raba ch' lm tocca." E 'l bap partit ad els la raba.

13. E pauc dids davo, il filg plü juven, haviand miss insemmel ogni chiaussa, giet el inavaunt seis viadi in pajais luntaun, è qua dissipet el sias facultads, vivana dissoluta maing.

14. E dapo ch' el havet spais ogni chiaussa, vene üna greiva charestia in quel pajais: tal ch' el cumanzet ad havair bsœng.

15. E giet, è s' matel cun ün dals havadaduors da quella contrada, il qual il tramatet sün seis bains, à perchürar ils porcs.

As a division in the class containing the derivatives of the Latin, the Rumanyo, or Roumain, of Wallachia, Moldavia, Bessarabia, and parts of the Bukhovinia, and Transylvania, stands (to repeat a well-worn illustration) as a genus with a single species; being, single-handed, of equal value with all the others. Nor is this wholly due to its geographical isolation. It has true points of internal difference—*inter alia* the post-positive article (*homul = homo ille = il uomo, el hombre, l'homme* elsewhere) like the Bulgarian and the Albanian, to the south, and the Lithuanian and the Norse languages to the north, of it. The change, too, from *c* to *p* is very regular.

English.	Latin.	Rumanyo.
Breast	pectus	pe*p*te
Milk	la*c*	la*p*te
Hip	co*x*a	koa*p*sa, &c.
Night	no*x*	no*p*te.

The glossarial elements which have been engrafted on the fundamental are what we expect *à priori*—Turk, Greek, Slavonic, and German. The remains of the language upon which the Latin itself intruded, would be, if collected, neither more nor less than the original Dacian. That they are Sarmatian is the decided opinion of the present writer as well as of other better judges. So influential an authority, however, as Grimm has persuaded himself, and perhaps others, that the Dacian names of certain plants and animals in Dioscorides are German.

Rumanyo.	*Latin.*
Bela in larga valle amblà,	Puella in larga valle ambulabat,
Erba verde lin caleà :	Herbam viridem leniter calcabat,
Cantà, qui cantand plangeà,	Cantabat, et cantando plangebat,
Quod tóti munti resunà,	Ut omnes montes resonarent :
Ea in genunchi se puneà,	Illa in genna se ponebat,
Ochi in sus indireptà :	Oculos sursum dirigebat ;
Ecce, Asi vorbe faceâ :	Ecce, sic verba faciebat :
Domne, domne, bune domne.	Domine, domine, bona domine.
Mica, fugu, frassinu	Nux, fagus, fracinus,

Rumanyo.	*Latin.*
Mult se certa intra séne	Multine certant inter se.
Nuce, dice frassinu,	Nux, dicit fracinus
Quine vine, nuci cullege.	Quisquis venit, nuces legit,
Cullegend si ramuri frange :	Colligendo ramos frangit :
Vaide dar de pelle a tua !	Væ itaque pelli tuæ !
Da tu fage, mi vecine,	At tu fage, mi vicine,
Que voi spune in ménte tene :	Quæ exponam mente tene ?
Multe fere saturasi :	Multas feras saturasti,
Qui prébéne nu amblasi ;	At haud bene ambulasti :
Quum se an geru apropiat	Quum gelu appropinquat
La pament te an si culcat,	Ad pavimentum te deculcant,
Si in focu te an si aruncat, &c.	Ad focum projiciunt.

In French Philology, the Norman-French, or Anglo-Norman, is simply so much French in an older form. For English Philology it must be treated as a separate language ; the words introduced from it being fuller in form, and, often different in meaning, from their descendants in the present French.

The Latin of the classics, notwithstanding its value, its antiquity, and the fact of its being the standard or typical dialect, is, in the way of bulk, a mere fraction of the language. The Low Latin is full of incorporated words, expressive of new ideas, and of foreign (often of German) origin. Besides this, in Poland, in Hungary, in Croatia, and elsewhere, the Latin has partaken of the nature of a vernacular ; and is, more or less, modified by the true vernaculars along with which it has been concurrently spoken. Even in the Latin of French, German, Italian, and other scholars, who have used it as a learned language, traces of the several native languages are to be found. In this respect it is to be compared with the Hebrew of the dispersed Jews. The Latin is, undoubtedly, of more importance than any two languages put together ; and if it were not for one great *desideratum* would be nearly perfect as a disciplinal study in the field of philological induction. What we miss is the knowledge of the exact nature of that Roman language which has so decidedly impressed itself

on so many of the nations conquered by Rome. It can scarcely have been the only Roman which is known to us, *i. e.* the Latin of the classics. However extreme may be the character of certain opinions, and however illegitimate many of the current statements concerning the differences between the Classical Latin and the *Lingua Rustica* may be, no one believes that every legionary of every legion in every portion of the Roman dominions spoke the Latin of Cæsar and Cicero. Not to mention the very evident fact that many legions bore the name of foreign populations, there were the differences, within Italy itself, of the Samnite, Etruscan, Marsian, Campanian, and what not, as compared with either the Latin of Latium, or the pure Roman of Rome. And that these differences were real, there is a fair amount of historical evidence.

There *must* have been a *Lingua Rustica*, though what this was is unknown ; and, of all the languages of Latin origin, it is the Rumanyo which this question touches the most closely.

CHAPTER LXXVIII.

The Greek.

THE *situs* of the Greek is on the frontier of the Latin. No one who recognizes the close affinity between these two languages can doubt as to their having, at some early period, graduated into one another. If, however, our views concerning the original diffusion of the Slavonic be right, it was only on its southern frontier that the Latin (through the Oscan of Campania) could ever have touched the Greek area; inasmuch as on the east and west lay the sea.

In order, however, to come to what the writer feels to be a philological paradox, viz. that the Greek language, foreign to the soil of Greece itself, was indigenous to Southern Italy and Sicily, and that it comports itself to the Italian of its original, and to the Albanian of its secondary area, much as our own English comports itself towards the German on the one side and the Welsh on the other—the English and the Greek being equally foreign to Greece and England—in order, I say, to have this apparent improbability forced upon us, one of the last vestiges of what may be called the Oriental hypothesis must be cast away. To the inquirer who believes that *both* the Latin and the Greek can be derived from Asia (or, indeed, any other country), or who considers that anything in the way of history is to be got out of the current doctrines concerning the Pelasgi and others, no such necessity suggests itself.

But if the languages of Southern Italy and Sicily were Greek, how came the fact to be unknown to the early Greek colonists in those parts, who treated the aborigines as barbarians? In this lies the main objection to the present hypothesis.

I do not altogether deny its validity. I only remark that, even if it were ever so much of a fact, it would only give the grounds of a slight objection. Let one district supply a colony to another, and let the country thus settled, after even a few generations, *re*-colonize the mother-country, and, what with change, on the one side, the other side, or both sides, the chances are that the original relationship will *not* be recognized. That this is scarcely what we expect *à priori* may be true. It is a fact nevertheless; and it is not, improbably, the rule rather than the exception. The best instance known is that supplied in the Malayan peninsula, where the Malays of Sumatran origin, with the Mahometan religion and with a fair amount of civilization, either overlook or ignore the close affinity between themselves and the aborigines; and, just in this way, may the colonial Greeks have overlooked the fundamental affinity, assumed by the present writer, between themselves and the Siculi, the Sicanians, and their congeners.

The arguments deducible from the Greek character of the local names in Sicily contrasted with the *Non*-Greek character of those in Hellas, and other points of minute criticism, find no place here. In a work like the present, all that is given is a notice of the conditions required for the *situs* of language in hand, and it is submitted that the only possible *situs* for the Greek is Southern Italy—Southern Italy including Sicily.

If this be the case, the analysis of that part of the Greek language which is other than Latin must be made with a special view towards the Albanian.

If this be the case, the affinities of the Greek with the Sarmatian and German will, as a general rule, be

indirect, *i. e.* the Greek will be what is called Indo-European chiefly, so far as it is Latin—chiefly, but not wholly. That such is the case with the German may be seen by any one who will make a list in English, Latin, and Greek. The words which are Greek and English will be Latin also. The words which are English and Latin will not so frequently be Greek. That there are exceptions—such as *θυγάτηρ*, *daughter*, *filia*—is true. The rule, however, is as it has just been given. With the Slavonic the case is somewhat different; the proportion of words other than Latin, but common to the Slavonic and the Greek, being greater. Subsequent, however, to the (hypothetical) Italian conquest of Hellas, there has been (and is) a great amount of Slavonic and Hellenic contact. The Non-latin elements common to the Lithuanic and the Greek, and the Sanskrit and the Greek, though not numerous, are obscure.

If this be the case, some of the differences between the Greek dialect may be due to differences originated on the soil of Italy. That the *Doric* took some of its Doric characteristics is probable: *Ionian*, however, and *Æolian* seem to belong, in the first instance, to the seas and shores of Italy rather than Asia.

If this be the case, there is between the Greek language and the Greek blood a minimum amount of coincidence.

If this view be right, the ordinary views of the Greek dialects are materially affected; and the Ionic and Æolic, instead of having become what they were in the Ionia, and Æolia of Asia, may have become what they were on the shores of the Ionian Sea and the Æolian Islands. At any rate, the fact of there being two Ionias, and two Æolias (one of each being Italian), must not be ignored. Neither must the circumstance of the Italian having been, apparently, the older ones. The Doric, on the other hand, seems to have taken its name, and some, at least, of its characteristics on the soil of Hellas. The evidence

of this, however, lies beyond the pale of the present notice.

Different from the question concerning the local origin of the Greek dialects is the question as to their value. That the division named Doric is of the same ordinal import as the other three is held by few. It is, rather, a co-ordinate of the Æolic Proper, and other forms of speech. If measured by their external relations, *i. e.* by the extent to which they differ, or agree, with other Hellenic dialects, the Attic and Ionic are classes of considerable value. If measured by their contents, *i. e.* by their divisions and subdivisions, they are small ones. In a great degree, however, they are scarcely dialects at all —not, at least, truly vernacular ones. They are literary languages; or, at any rate, literary languages in the way that the Lingua Urbane of Italy are literary languages as compared with the Lingue Rustiche of their neighbourhoods.

The real *data* for anything beyond a general and conventional view of the ancient Greek dialects are the fragmentary compositions of minor writers, glosses, local decrees, inscriptions, and, to a slight extent, theatrical imitations or caricatures. From these, taken altogether, we may safely infer that the true vernaculars of the Athenian frontier and the Ionian area were anything but the Attic of the dramatists, and the Ionic of Herodotus.

The ancient Greek, as it sounded in the ears of the common people, is as little known to us as the Lingua Rustica of the Romans: and it is well to be aware of the extent of our ignorance concerning it. When the details of the *modern* dialects shall have commanded the attention they deserve, the question which has already suggested itself in Italy will suggest itself in Greece. Is this the descendant of the languages of Archilochus, of Pericles, of Sappho, of Epicharmus, or of some obscure dialect, which in the time of the classical writers was

really or nearly a different language? Such is the question which will be asked frequently. Such is the question which is asked (but not answered) now.

With the dialects of the modern Greek, or Romaic, more has been done than I have had the opportunity of studying. I have seen *thirteen* given as the number of them. This is, probably, either too much or too little. It is too much if we look at the primary groups; and too little if we take in the *minutiæ*. The departures, however, in the few dialects I have inspected, from the ordinary Greek of any classical writer are so considerable. that an independent origin must be assumed. There is also a great range in the phonesis; the Lesbian dialect, for instance, being, like the dialects of Northern Italy as compared with the Italian Proper, characterized by a nasal *n* like that of the French.

The form of speech, however, which has most especially stimulated the curiosity of scholars is the Tzakonian (Laconian), spoken in a few villages on the eastern slope of Mount Taygetus. This it is which is more especially set-up as an independent language, a language bearing the same relation to the ordinary Romaic that the Provençal does to the French.

This may be the case. That it is the descendant of some extreme form of ancient Greek—the Cynurian dialects as suggested by Thiersch who has carefully studied it—is certain.

It is from Thiersch that the following extracts are taken :—

Singular.—Nom.	ἐσόυ	ἐχίου	——
Gen.	μί	τί	σί
Dat.	μί	νί	νί
Acc.	ἐνίου	χίου	σί
Plural.—Nom.	ἐνύ, ἐμύ	ἐμου	——
Gen.	νάμου	νιόυμου	σου
Dat.	νάμου	νιόυμου	σου
Acc.	ἐμούνανε	ἐμόυ	——

Of the so-called verb substantive the following is

the conjugation for the Present and Preterite Indicative.

Present.		Preterite.

The Paternoster.

Ἀφένγα νάμου π' ἔσι 'ς τὸν οὐρανέ. Νὰ ἔννι ἁγιαστέ τὸ ὀνομάντι, νὰ μόλῃ ἃ βασιλειάντι, νὰ ναθῇ τὸ θελημάντι σὰν 'τὸν οὐρανέ ἔζρου ζὲ 'τὰν ἰγῆ. Τὸν ἄνθε τὸν ἐπιούσιον δὶ νάμου νι σάμερε, ζὲ ἄφε νάμου τὰ χρίε νάμου καθοὺ ζὲ ἐνὺ ἐμμα φῖντε τοὺ χρεουφελῖτε νάμου, ξὲ μὴ νὰ φερίζερε ἐμούνανε 'ς κειρασμὸ, ἀλλὰ ἐλευθέρου ἀπὸ τὸ κακὸ.

On the other side of Mount Taygetus the Mainot dialect is spoken, being Messenian rather than Laconian. An offset of the Mainot is spoken by the Greeks of Corsica—of which the following is an extract from the only-known specimen.

Luke xv. 11–19.

11. Ἕνας ἄθρωπος εἶχε δύο ὑούς.

12. Καὶ εἶπε ὁ πλέο μικρὸς ἀπὸ ἄυτους τ' ἀφέδοῦ του, Ἀφέδη, δόμου τὸ μερδικὸ τοῦ προικίου ὁποῦ μοῦ τρέχει. Καὶ τοὺς ἐμέρασε τὸ προικίο.

13. Καὶ ὕστερα ἀπ' ὀλίγαις ἡμέραις μαζομένο πᾶσα πρᾶγμα ὁ πλέο μικρὸς, ἐδίαϊ εἰς μία χώρα ἀλάργου· καὶ ἐκεῖ ἐσκόρπισε τὸ προικίο ζώντα σαρκικά.

14. Καὶ ὕστερα ἀπ' οὖ ἔξοδίασε πᾶσα πρᾶγμα, ἦρτε μία μεγάλη πεῖνα εἰς ἐκεῖνη τὴ χώρα· καὶ ἐκεῖνος ἄρχησε ν' ἄχει χρεία.

15. Καὶ ἐδίαϊ καὶ ἔσμιξε μὲ ἕναν πολίτην ἐκεῖνης τῆς χώρας· καὶ τὸν ἔστειλε εἰς τὰ χωράφιά του νὰ βόσκῃ τοὺς χιούρους.

16. Καὶ ἀγάπα νὰ γομίσῃ τὴν κοιλιὰν τοῦ ἀπὸ τὰ βελάνια ὁποῦ ἔτρώανε οἱ χιούροι· καὶ κανένας δὲν τοῦ ἔδιδε.

17. Ἐρχόμενος εἰς ἑαυτόν του, εἶπε, Τόσοι δοῦλοι τ' ἀφέδοῦ μου χορτένουνε ἀπὸ ψωμὶ, κιὶ ἐγὼ ψοφῶ ἀπὸ πεῖνα !

18. Σηκόνομαι καὶ πάω στ' ἀφέδοῦ μου, καὶ τοῦ λέω, Ἀφέδη, ἔμαρτα εἰς τὸν οὐρανὸν καὶ ἀπροστά σου.

19. Καὶ δὲν εἶμαι πλέο ἄξιος νὰ φωναχθῷ ὑός σου· κάμε μὲ ὡς ἕνανε ἀπὸ τοὺς δοῦλους σου.

Though the earliest specimens of the Greek are earlier than the earliest specimens of the Latin, it by no means follows that the Greek is the older language: indeed, as it rarely happens that any one language is *wholly and in every part* more archaic in its form than another, the terms *older* and *newer* must be used with extreme caution. As far as the Latin preserves the neuter and accusative forms in *-m* (which in Greek become *ν*), along with other characteristics, it is, *pro tanto*, older. With its preterites in *-κα*, its greater amount of verbs in *-μι*, as well as in other points, the comparative antiquity is on the side of the Greek. In its eschewal of consonantal terminations, (no words in the standard language, with the exceptions of ἐκ and οὐκ, ending in any consonant but σ or ν,) the Greek reminds us of the modern Italian rather than the ancient Roman: indeed, for any language but the Greek, its extreme liquidity and vocality would earn for it the character of weakness or something equally disparaging.

CHAPTER LXXIX.

The German Class.—The Mœsogothic.—The High and Low German.—The Anglo-Saxon and English.—The Frisian.—The Norse, or Scandinavian.

THE language belonging to the German group, for which we have the earliest specimens, is known by the somewhat exceptionable name of *Mœsogothic;* wherein we have a large portion of the Gospels, as translated by Ulphilas, in the fourth century, for the Goths of the Lower Danube; along with a few other minor fragments. It is the earliest as well as the latest member of its class. It was spoken by a population projected into a foreign locality, and by a population of which the original locality has been filled up by dialects from another area. Its original area was probably Thuringia. As compared with the modern German dialects (the word being taken in its widest sense, so as to comprise the English and the Swedish), it is old: and it is old even when compared with the Anglo-Saxon, the Icelandic, and the Old German: though not in every point. It has (as stated) no direct descendants.

Then come the languages of Southern Germany, in which we have compositions as old as the eighth century: some being what is called *Alemannic* or German of the Upper *Rhine*, rather than *Bavarian* or German of the Upper *Danube*, and *vice versâ*. They graduate, however, into each other.

The German of the *Middle* Rhine, often called *Frank*, is intermediate in character to the German of the

South and North, the former being called *High*, the latter *Low*, German. And, in their extreme forms, they are so named with propriety. They graduate, however, both in the older and newer dialects, into one another, and can only be separated by an arbitrary line; in other words, by fixing upon some single character—and even that is not constant.

In these two divisions the modern literary German is the cultivated representative of the High, the Dutch of Holland, of the Low group. Neither, however (as is the case with literary languages in general) represents any dialect exactly.

The old standard of the High German is the Bible translation of the reformers; and, as Luther was a Saxon, it passes for being more akin to the language of the parts about Dresden and Leipzic than aught else. When it was pressed upon the Low Germans it was contemptuously called Luther's *Misnian*. Yet the dialect of Meissen is, by no means, either the literary German or its pure and simple progenitor.

The High German dialects are numerous; and it is probable that some are, in complex sentences, mutually unintelligible—especially in certain outlying districts, such as Monte Rosa, the Italian Tyrol, the Sette and Tredici Commune in Venetia, and the Siebenbürgen in Transylvania. The Swiss German belongs to this division; indeed, it is probable that the Swiss, the Suabian, and the Bavarian all form divisions of equal value with that of the High German itself.

At present there is (with one small exception) nothing spoken in Germany Proper but dialects belonging to one of these two divisions. A thousand years ago, however, in the parts about the Sauerland and the Ysel, the language of Northern Germany was *Saxon*. Herein, the most southern dialect was the *Old* Saxon of Westphalia, of which a few specimens have been preserved. To the north and north-east of this lay the *Anglo-*

Saxon, or the English in its oldest form—bounded on the one side by the sea, on the other by the Danish and Slavonic. Little more than a variety, to the west lay the Frisian of Friesland: of which a modification named the North Frisian is spoken in Sleswick. In Saterland, too, one of the fenniest districts of Germany, Frisian is still spoken; and this exception to the general statement that there is nothing in Germany but the German is the one alluded to. The statement itself meant that the Saxon forms of speech have been obliterated. In Holland it is spoken largely.

The Frisian is transitional between the German and the Scandinavian (or Norse) branch of this important class; the Scandinavian or Norse languages being the Icelandic, the Feroic, the Danish, the Swedish, and the numerous dialects of Norway—the literary Norwegian being the Danish. With a post-positive article, and a so-called passive voice (arising out of a middle; itself the result of a fusion between the verb and the reflective pronoun), the Norse languages are sufficiently separated from the German—neither of these characteristics being found in even the Frisian. At the same time they are phenomena of which we may easily overvalue the import. Both are of comparatively recent origin; and in the Danish of Sleswick, the post-positive article is wanting. The other Danish dialects are the Northern and Southern Jute; the island dialects (of which those of Sealand and Fyen are the chief); and the dialect of Bornholm. In Sweden, that of Scaane is sufficiently Danish to have been ascribed to Denmark—probably on insufficient grounds.

North of Scaane the main dialects are those of East and West Gothland, of the island of Gothland, of Upland, Smaaland, and Dalecarlia. More outlying still, is the dialect of the free Swedish yeomen (*fria Svenska bönder*), of parts of Estonia and some of the small islands opposite.

In Norway, where the dialects have met with more than ordinary attention, and where some extreme patriots hope to evolve out of them a literary language by which the *now* foreign Danish may be superseded, the approach to the old Norse, accurately represented by the Icelandic, and approximately by the Feroic, is closer than in any part of Denmark, and (with the doubtful exception of Dalecarlia) any part of Sweden either—the characteristic which has drawn the most attention being a third gender; the feminine. In the literary language there is only a common gender and a neuter.

Among the Norwegian dialects we have specimens of twenty in the curious work of Aasen.

Northern.—Lofoden, Helgeland, Inderöen, Stjördalen, Orkedalen, Nordmör.

Western.—Söndmör, Sondfjord, Sogn, Nordhordland, Voss, Hardanger, Söndhordland, Yæderen.

Southern.—Sætersdalen, Tellemarken, Valders, Hallingdal, Gullbrandsdal, Osterdalen.

It is difficult to arrange these; inasmuch as the specimens are either short narratives taken from the mouth of the common people or descriptions of some locality: the object of the collector being less the exhibition of so many forms of his mother-tongue as dialects, than the collection of materials for the development of a common Norwegian language, as opposed to the Danish now current.

It is evident, however, that they all agree on one point, viz. in approaching nearer than the present literary language to the Old Norse. Generally, if not always, they have a feminine gender; often a dative case. In the use of *a* instead of *e*, at the end of words, many of them approach the Swedish.

For the new Norwegian dialect to be obtained by a free and eclectic use of these materials there are suggested (*inter alia*) an infinitive in *a*, giving *fara*, *döma*,

&c., instead of the existing *fare, döme,* &c., and a feminine gender—a restoration which few Englishmen will mistake for an improvement.

A series of facts upon which the evidence of the Greek and Latin languages is silent, is well exhibited in the history of those of the German group—best, perhaps, and most especially by that of the Norse tongues. This is because (out of it) no fewer than three literary languages have been evolved ; not to mention numerous dialects and sub-dialects. Of these—

1. The modern Icelandic has preserved the old language with a *minimum* amount of alteration ; practically speaking, indeed, the modern Icelandic and the Old Norse are synonymous.

2. The Swedish either changed more slowly than Danish or began its changes later.

3. The Danish either changed more quickly than the Swedish or began its changes earlier. Petersen, to whom the best investigation of these interesting points is due, considers that Denmark was (so to say) about a century ahead of Sweden ; in other words, that if the Danish had reached a given stage in (say) A.D. 1400, the Swedish reached it about A.D. 1500. Meanwhile, the Norwegian remained in a comparatively unaltered condition until the Reformation, when change set in so rapidly that half a century put it on the level with its sisters.

I lay this before the reader not because the statement can be taken strictly and literally (which was, by no means, the author's intention), but, because (being true in the main), it illustrates phenomena, for which we have no superabundance of *data,* but, unfortunately on the contrary, a deficiency—viz. the conditions under which change sets in, and the rate of the change itself. Incidentally, too, they show what is even of greater interest, *i. e.* the regularity with which the same changes are undergone by different forms of speech. Roughly speaking, we may say that in the break-up of the Old

Norse the same inflections are lost, in the same order; and that they are replaced by the same substitutes. The changes (in other words) are the same; the rate only being different.

The blood and language in this family coincide but slightly—the range of the latter being the widest. Before the spread of the German, Scandinavia was Ugrian, and, probably, to some extent Prussian or Lithuanic; Denmark, whether Ugrian or Sarmatian, other than German; all the parts beyond the Elbe, and, possibly beyond the Teutoberger Wald, Slavonic; all the parts to the South of the Mayn (in the opinion of the present writer) the same; Britain, Keltic Roman and mixed. Hence, the original area of the Germans is included by the Teutoberger Wald, the Elbe and Saale, the Mayn, and the Rhine—an area which, small as it is, when compared with the present magnitude of the German, is greater than that of the Latin family.

It should be added, however, that these limitations are, by no means, currently admitted; least of all in Germany itself, and that they are incompatible with two current doctrines—(1.) that all the populations mentioned in the Germania of Tacitus were German, and (2.) that the name *Goth* indicates a German population. His objections to both these doctrines have been given by the present writer elsewhere. The Germans were Goths just as the English are Britons, *i. e.* they took the name when they settled in a country originally Gothic.

CHAPTER LXXX.

The Keltic Languages.—British Branch.—Gaelic Branch.

OF the Keltic Stock there are two Branches.

(1.) The *British*, represented by the *Welsh*, the *Cornish* and the Armorican, or *Breton*, of Britany. It is almost certain that the old British, and the ancient language of Gaul, belonged to this branch.

English.	Welsh.	Cornish.	Breton.

Eight	wyth	eath	eiz
Nine	naw	naw	nao
Ten	deg	dek	dec
Twenty	ugain	ugenis	ugent
Hundred	cant	cant	cant.

The Cornish literature is of the scantiest. A poem called Calvary, three religious dramas or mysteries, and a vocabulary, are, perhaps, as old as the fifteenth century. Then there is another religious drama, by William Jordan—A.D. 1611, a few songs, a few proverbs, a short tale, two translations of the first chapter of Genesis, which Mr. Norriss (the authority for all these statements) says are very poor, translations of the Commandments, Belief, and the Lord's Prayer, one of which is called ancient, the other modern; but this (I again quote Mr. Norriss) without any apparent reason for the distinction.

Cornish.

Deus Pater.

Adam, otte an puskes,
Ythyn a'n nef ha'n bestes,
  Kefrys yn tyr hag yn mor;
Ro thethe aga hynwyn,
Y a thue the 'th worhemmyn,
  Saw na byhgh y war nep cor.

Adam.

Yt 'hanwaf bugh ha tarow,
Ha margh, yw bast hep parow

  The vap den rag ymweres;
Gaver, yweges, karow,
Daves, war ve (?) lavarow
  Hy hanow da kemeres.

In English.

God the Father.

Adam, behold the fishes,
The birds of heaven, and the beasts,
  Equally in land and in sea;
Give to them their names,
They will come at thy command,
  But do not mistake them in any sort.

Adam.

I name cow, and bull,
And horse, it is a beast without equal
  For the son of man to help himself;
Goat, steer, stag,
Sheep, from my words
  To take their names.

Lemyn hanwaf goyth ha yar,
A sensaf ethyn hep par
The vygyens den war an beys;
Hos, payon, colom, grvgyer,
Swan, bargos, bryny ha'n er,
Moy drethof a vyth hynwys.

Y wf hynwyn the'n puskes,
Porpus, sowmens, syllyes,
Ol thy'm gustyth y a vyth;
Leneson ha barfusy,
Pysk ragof ny ura skvsy
Mar corthyaf dev yn perfyth.

Deus Pater.

Rag bones ol tek ha da.
In whed dyth myns yw formyys,
Aga sona a wra:
May fe seythves dyth hynwys.
Hen yw dyth a bowesva
The pup den a vo sylwys;
Yd dysguythyens a henna
Ny a boves desempys.

Now I name goose and fowl,
I hold them birds without equal
For food of man on the earth;
Duck, peacock, pidgeon, partridge,
Swan, kite, crows, and the eagle,
Further by me are named.

I give names to the fishes,
Porpoises, salmons, congers,
All to me obedient they shall be;
Ling and cod,
A fish from me shall not escape
If I honour God perfectly.

God the Father.

For all that is fair and good,
In six days all that is created,
Bless them we will:
Let it be called the seventh day.
This is a day of rest
To every man that may be saved;
In declaration of that
We will rest forthwith.

THE PATER-NOSTER.

Older Form.

An Taz, ny es yn nêf, bethens thy hannow ughelles, gwrênz doz thy gulas ker: Bethens thy voth gwrâz yn oar kepare hag yn nêf: ro thyn ny hithow agan peb dyth bara; gava thyn ny ny agan cam, kepare ha gava ny neb es cam ma erbyn ny; nyn homfrek ny en antel, mez gwyth ny the worth drok: rag gans te yn an mighterneth, an creveder, hag an' worryans, byz a venitha.

Newer Form.

Agan Taz, leb ez en nêv benigas beth de hanno, gurra de gulasketh deaz, de voth beth gwrêz en' oar pokar en nêv; ro dony hithow agan pyb dyth bara; ha gava do ny agan cabmow, pokara ny gava an gy leb es cam ma war bidn ny; ha na dege ny en antail, brez gwitha ny dort droge: rag an mychteyrneth ew chee do honnen, ha an crêvder, ha an 'worryans, rag bisqueth ha bisqueth.

(2.) The *Gaelic* or *Erse* Branch, represented by the present *Irish Gaelic*, the *Gaelic* of the *Highlands of Scotland*, and the *Manks* of the *Isle of Man*.

The Cornish and Armorican are more closely allied than the Cornish and Welsh.

The Armorican, or Breton, falls into (at least) two dialects, the Breton Proper and the Vannetais of Vannes.

Song of Solomon ii. 1–4.

(1.)

Breton Ordinary.

1. Me eo ar rosen Sharon, hag el lilien ann traouennou.

2. Evel a lilien é-kreiz ar spern, ével-sé é-ma va miñounez é-kreiz a merc'hed.

3. Evel eur wezen avalore é-kreiz gwéz ar c'hoadou, ével-se é-ma va miñoun é-kreiz ar vipien. Dinda*n* hé skeûd ounn bet azézet, hag hé frouéz a oa c'houék d'am genou.

4. Va lékéat en deûz da vo*n*t é ti ar gwîn ; hag hé arwéz dreist-ounn a oa karantez.

(2.)

Breton of Vannes, or Vannetais.

1. Mé zou er rosen Sharon, hag el lilien en douareu-izél.

2. El ul lilien é creis e spern, èl-cé e-'ma me haranté étré er merhèd.

3. El ur huéen-aveleu étré qué er hoédeu, èl-cé è-ma me muian-caret è mèsq er pautred. Azeét é-on bet idan é squœd quet ur vourradiqueah bras, hag è frèh e oè huék a p'en tanhouas.

4. Ean em gassas d'én ty a chervad, hag è arrès, dreist-on, e oè carante.

The following is the parable of the Sower in (1.) the Gaelic of Connaught, (2.) the Gaelic of Munster.

(1.)

Féuch, do chuáidh síoladóir a mach do chur síl:

Agus ag cur an tsíl do, do theut cuid dhe chors na sligheadh, agus tangadar na héànlaith, agus a dúadar é :

Agus do thuit cuid eile dhe a bhfearan chlochach, mar nach raibh móran uire aige : agus do fhás sé go lúath, do brígh nach bhfúair sé dorinhneachd na talmhan :

Agus ar néirghe don ghréin, do dóidheadh é ; agus ar son nach raibh fréumh aige, do shearg sé.

Agus do thuit cuid eile dhe eidir mhuineach ; agus do éirghe an muineach súas, agus do mhuch sé é :

Agus do thuit cuid eile dhe a dtalamh mhaith, agus tus sé toradh, cuid céuduired, cuid trí fichid uiread, cuid a deich fichead uiread.

Gidh bé agá bhfuillia cluása chum éisdeachda, éisdeagh sé.

(2.)

Feuch, do cheiaid síoladóir amach ug cur síl.

Agus ag cur an tsíl do, do thuit cuid de cois na slíghe, agus tháinigh na héanlacha agus d'itheadar suas è ;

Do thuit cuid eile dhe air thalamh bhí lán do chlocha, ait, ná raibh morân cré aige ; agus dfhás sé suas a' urchar, mar ná raibh doimhníos na talmhan aige ;

Agus air éiríghe don ghréin do dóghag é ; agus mar ná raibh aon phreumh aige, do chríon se ;

Agus do thuit cuid eile dhe a measg deilgnídhe ; agus dfhás na deilgnídhe suas, agus do mhúchadar é ;

Ach do thuit cuid eile dhe air thalamh mhait, agus thug toradh uaig, cuid de a chéad uiriod feín, cuid a thrí fichid uiriod, agus cuid a dheich der fhichiod uiriod.

Pé duine go bfuil cluasa chum éisdeachta aige, éisdigheach sé.

1. In Irish there is a peculiar form for the dative plural as *cos* = *foot*, *cosaibh* = *to feet* (ped-*ibus*) ; and beyond this there is little else whatever in the way of *case*

as found in the German, Latin, Greek, and other tongues. Even the isolated form in question is not found in the Welsh and Breton.

2. In Welsh the pronouns for *we*, *ye*, and *they*, are *ni*, *chwyi*, and *hwynt* respectively. In Welsh also the root = *love* is *car*. As conjugated in the plural number this is—

car-*wn* = am-*amus*.
car-*ych* = am-*atis*.
car-*ant* = am-*ant*.

Now the *-wn*, *-ych*, and *-ant* of the persons of the verbs are the personal pronouns, so that the inflection is really a verb and a pronoun in a state of *agglutination*; *i. e.* in a state where the original separate existence of the two sorts of words is still manifest.

3. The Keltic noun changes its initial letter according to its relation to the other words of the sentence; of course subject to rule.

(*From the Welsh.*)

Câr, *a kinsman.*
1. *form*, Câr agos, *a near kinsman.*
2. Ei gâr, *his kinsman.*
3. Ei châr, *her kinsman.*
4. Vy nghâr, *my kinsman.*

Tâd, *a father.*
1. *form*, Tâd y plentyn, *the child's father.*
2. Ei dâd, *his father.*
3. Ei thâd, *her father.*
4. Vy nhâd, *my father.*

Pen, *a head.*
1. *form*, Pen gwr, *the head of a man.*
2. Ei ben, *his head.*
3. Ei phen, *her head.*
4. Vy mhen, *my head.*

Gwâs, *a servant.*
1. *form*, Gwâs fydhlon, *a faithful servant.*
2. Ei wâs, *his servant.*
3. Vy ngwas, *my servant.*

Duw, *a god.*
1. *form*, Duw trugarog, *a merciful god.*
2. *form*, Ei dhuw, *his god.*
3. Vy nuw, *my god.*

Bara, *bread.*
1. *form*, Bara cann, *white bread.*
2. Ei vara, *his bread.*
3. Vy mara, *my bread.*

Lhaw, *a hand.*
1. *form*, Lhaw wenn, *a white hand.*
2. Ei law, *his hand.*

Mam, *a mother.*
1. *form*, Mam dirion, *a tender mother.*
2. Eivam, *his mother.*

Rhwyd, *a net.*
1. *form*, Rhwyd lawn, *a full net.*
2. Ei rwyd, *his net.*

(*From the Erse.*)

Súil, *an eye.*
1. *form*, Súil.
2. A húil, *his eye.*

Sláinte, *health.*
2. *form*, Do hláinte, *your health.*

The following is found in the fly-leaf of a copy of *Juvencus*. It is pronounced to be not Welsh; not Cornish; but *Pict*.

(1.)

Ni guorcosam nemheunaur henoid
Mi telun it gurmaur
Mi am franc dam an calaur.

(2.)

Ni con ili ni guardam ni cusam henoid
Cel iben med nouel
Mi am franc dam an patel.

(3.)

Na mereit nep leguenid henoid
Is discinn mi coweidid
Dou nam Riceur imguetid.

*Translation of Mr. Nash.**

(1.)

I shall not sleep a single hour to-night,
My harp is a very large one,
Give me for my play a taste of the kettle.

(2.)

I shall not sing a song, nor laugh or kiss to-night,
Before drinking the Christmas mead.
Give me for my play a taste of the bowl.

(3.)

Let there be no sloth or sluggishness to-night,
I am very skilful in recitation.
God, King of Heaven, let my request be obtained.

Translation of Archdeacon Williams.

(1.)

I will not sleep even an hour's sleep to-night,
My family is not formidable,
I and my Frank servant and our kettle.

(2.)

No bard will sing, I will not smile nor kiss to-night;
Together . . . . to the Christmas mead
Myself and my Frank client and our kettle.

(3.)

Let no one partake of joy to-night,
Until my fellow soldier arrives.
It is told to me that our lord the King will come.

---

* Taliessin; or, the Bards and Druids of Britain, p. 79.

I have given it as I found it. The word *Noël*= *Christmas* is Anglo-Norman. It is not an impossible, though not a *likely*, word to be found in the Pict; though it is quite as likely as the fact of a Pict reading *Juvencus*.

For the details of the early stages of the Keltic languages the valuable work of Zeuss is the great repertorium, the materials being for—

The Irish.—1. Glosses on Priscian, in the library of St. Gallen. They are marginal and interlinear; written in three hands. A few are in the Ogham character; the majority in the ordinary Latin. The seventh century is the assigned date of these glosses on Priscian.

2. The glosses of the Codex Paulinus.—This is a MS. in the library of the University, originally of the Cathedral of Wirtzburg. They apply to the Epistles of St. Paul. The Pauline glosses are possibly as old as the Priscian.

3. The Milan glosses.—These are a Commentary on the Psalms, rightly or wrongly ascribed to St. Jerome. They are, perhaps, as old as the preceding.

4. The glosses on Beda, in the Carlsruhe Library.—Somewhat later than the Milan, Wirtzburg, and St. Gallen MSS.

5. The Carlsruhe glosses on Priscian.—In some parts these are based upon the St. Gallen MSS., or, at any rate, originate in a common source. In others they are independent.

6. The St. Gallen Incantations, or formulæ for effecting charms; more or less metrical, if not poetical, in character.

7. The Codex Camaracensis.—This contains *Canones Hibernii Concilii*, A.D. 684. The MS., however, belongs to the ninth century.

Of works of equal antiquity with these, in the British division of the Keltic tongues, Zeuss gives fewer for Wales than for Ireland. They are—

The Welsh.—1. *Codex Oxoniensis prior* (Bodleian, originally NE. D. 2. 19, now F. 4. 4—32), containing glosses on Eutychius and Ovid's *Ars Amandi*, also the alphabet of *coelbren y beirdd*, along with *De mensuris et ponderibus quædam, Cambrica intermixta Latinis*, pp. 22^h—23^a.

2. *Codex Oxoniensis posterior* (Bodleian, originally NE. B. 5. 9, now MS. Bodl. 572), membranaceus, formæ minoris, res theologicas continens, in medio autem; and p. 41^b, usque ad 47^h persa quædam Latina ad præbendam pueris verborum copiam (ut videtur) cum vocibus Cambricis, quæ scriptæ sunt aut supra vocabula Latina aut post ea in linea cum signo I. glossatorum solito.

3. *Codex Ecclesiæ Lichfeldensis* (antea Landavensis). The Gospels, with certain entries of donations made to the Cathedral of Landaff—adnotatæ sunt Latine, sed cum nominibus vel etiam sententiis Cambricis. Published by Wanley.

4. *Folium Luxemburgense.* Published by Mone, in Die Gallische Sprache Karlsruhe, 1851.

5. *Liber Landavensis.*

6. *Codex Legum Venedotianus.*—The Laws of Howell Dda.

7. *Codex Ruber Hergestensis (the Red Book of Hergest).* In the library of Jesus College. Intermediate between the Old and Middle British.

The Cornish.—1. The Cotton MSS., British Museum, Vesp. A. 14.

2. *Carmen de Passione Christi.*

The Breton.—1. Glosses in the Chartularies of the Monasteries of Rhedon and Landevin.

2. *Vita S. Nonnæ.* A mystery of the twelfth century. Published as the *Buhez santez Nonn*, with an Introduction by the Abbé Sionnet, and with a literal translation by M. Legonidec. Paris, 1837.

The researches of Mr. Whitley Stokes have added to our materials for the Irish, and Mr. Bradshawe, of

Cambridge, has made the important discovery of a specimen of what may be called the *Middle* Scotch Gaelic; in which language there had previously been nothing older than the Reformation.

The following inscriptions are from Gaul (*i. e.* undoubted Keltic ground), and they are treated by Keltic scholars as Keltic—so far, of course, as they are not Latin.

The range of the Keltic blood is inordinately larger than the range of the Keltic language: the former being found, to a great extent, in the French parts of France, and the English parts of England, and North America.

CHAPTER LXXXI.

The Bask, Basque, or Biscayan.

THIS is the language with which I conclude; and although it is a language which comes at the end of a work which professes to have dealt with nearly all the known forms of speech in the world, it is, in the way of philological importance and interest, equal to any two of the ones which have preceded it. That this interest and importance arise, to a great extent, out of the mystery with which it is enveloped, is easily surmised.

No language stands so much alone as the Basque. To a certain extent this is what we expect. In the first place it is spoken on the side of the vast Atlantic Ocean, with nothing nearer to it, due west, than the languages of America, and with nothing nearer to it on the south than the languages of Africa; for the Spanish, a descendant of the Latin, must, in respect to its origin, be looked upon simply as a language of Italy.

Nor is this all—Spain and Portugal constitute a peninsula rather than an ordinary part of a continent; so that it is only on one side (a broad one no doubt) with which it comes in contact with anything but the speechless sea; and that sea a sea of the extreme west.

More still—on few (if any) portions of the earth's surface have the displacement and obliteration of what, in an earlier period of the world's history, may have been transitional forms, been greater. The Latin has, for above two thousand years, been dominant in Spain. The

Latin has, for more than fifteen hundred years, been dominant in Gaul. Of the original languages of Corsica and Sardinia nothing except what can be obtained by minute trains of inferential instances exists. Nor is the case very different when we go further. Beyond the Slavonic, the Keltic, the German and the Latin, what is there with which the Bask can, in the first instance, at least, be compared? To assume the prior existence of a family or families of languages now lost is to explain the *ignotum per ignotius;* whilst (as has just been stated) the Bask has on the west, the south, and the east nothing but the sea. Many languages, such as those in the centre of a continent, have what may be called *quaquaversal* aspects. Most languages have frontagers on two sides. The Bask never had frontagers except in one direction; and in that direction those frontagers have been displaced.

In all this we have real, material, external and objective elements of mystery. The others are subjective; *i. e.* they relate to our ignorance as it arises from the neglect of our *data* rather than from the non-existence of the *data* themselves. Except for philological purposes, the Baśk has never been a language to command attention; and for philological observation (unless an exception can be made in their favour on account of the researches of the Jesuits upon the rude languages of such pagans as they either failed or succeeded in converting to Christianity) the natives of the Spanish peninsula have never been eminent.

That the Basks themselves should have studied their language is what we expect; but knowing how, until lately, the Keltic tongues were studied by patriotic amateurs in the way of philology, we are fully prepared to find that they have done it with more zeal than criticism.

Much of the Bask area is now covered by the philological descendants of the Latin. The Keltic, that pre-

vailed in Gaul before the time of Cæsar, although the extent of its diffusion has been enormously overrated, was, in Gaul and on the German frontier at least, an encroaching language; so that, even if we should have succeeded in reconstructing the original *situs* of the languages before the time of Cæsar, the reconstruction of an earlier *situs* would still stand over.

Taking things, then, as we find them, the nearest Keltic to the present Bask area is in Brittany, the nearest German in French Flanders, and the nearest Slavonic in Bohemia. The original extension of these languages towards the south, the west, and south-west no one knows in its details. Even its generalities are a matter of surmise and inference.

In all this we find an approximate reason for the great extent to which the Bask has been either separated from other languages or connected with the most improbable ones.

The Fin hypothesis, in the technical sense of the term, and in opposition to the opinion of those who have merely found Fin and Siberian coincidences with the Bask,—the Fin hypothesis, which taught that not only did the Kelts, the Germans, the Sarmatians, the Latins, and the Greeks come from Asia, but that before their advent into Europe there was a population of congeners continuously spread over the whole continent from Hammerfest to Gibraltar, of course, gave much importance to the Basks; giving them also their nearest existing kinsmen in Lapland, in Estonia, and in the Government of Penza—the three points nearest to the Pyrenees which are, at the present moment, occupied by Ugrians. Little has come out of this beyond some incidental assertions resting on an otiose belief in the doctrine. At the same time, it is probable that, as far as there are any positive opinions at all on the matter, they are more or less connected with the Fin hypothesis. Nor is this unnatural.

Of the fifty-six words in Bonaparte's *Specimen Lexici Comparativi omnium Linguarum Europæarum* the isolation of the Basque is most conspicuous; even after we have made due and full allowance for the fact of its being the only member of its class. Herein—

The words like *Spirit, Angel, Paradise,* &c. are, as is to be expected, Latin; being which they may be eliminated.

With the Latin, however, beyond these, there is no Bask word in common. Nor yet with the Greek. Nor yet with the German. Nor yet with the Keltic. Nor yet with the Skipitar. There is nothing, in short, like anything in Southern, Central, or Western Europe. What is more legitimate than to look for them in the parts beyond—at the outcrop, so to say, of the secondary and later layers of populations?

With the Fin there are the following approximations:—

English.	Basque.	Ugrian.
God	jainco	jen, *Zirianian*
Thunder	turmoi	diermes, *Lap*
Night	gau	gi, jy, *Vogul*
Rain	uri, euri	jor, *Tsheremiss.*

And with the Slavonic the following:—

English.	Bask.	Slavonic.
Lake	aintzira	ezero
River	errio (? *Spanish*)	re'ka
Ice	lei	led.

This is little enough: nor do we find much more if we look in a direction, first suggested (I believe) by Leibnitz, viz.: towards Africa: where Semitic affinities, Berber affinities, Egyptian affinities have been noticed. Of these the latter has commanded attention from the remarkable coincidence it gives us in the names for the numerals *one, six* and *seven;* where accident and borrowing seem to be equally out of the question. Add

to these the words for *evening* and *rain*, and the Coptic, the Fin affinities become about equal.

English.	Basque.	Coptic.	English.	Basque.	Coptic.
Head	burua	afe	*Fire*	sua	klom
Hair	illea	bo	*Water*	ur	mau
Eye	beguia	bal	*Rain*	uri	eroou
Ear	belarria	maake	*Cloud*	odei	kloole
Nose	sudurra	sha	*Earth*	lur	kah
Mouth	aboa	ro	*Sea*	itsaso	iom
Tongue	mingaña	aspe	*Bird*	egastia	halet
Hand	escua	tot	*Fish*	arraya	tebt
Foot	oiña	rat	*Egg*	arraultza	soouhi
Blood	odola	snab	*Stone*	arria	al
Bone	ezurra	kas	*Tree*	arrecha	khaf
Beard	bizarra	malt	*One*	bat	ouot
Day	egun	meri	*Two*	biga	snau
Night	gau	eushi	*Three*	hiru	shomt
Sun	eguzqui	ri	*Four*	laur	fto
Moon	illargui	ioh	*Five*	bortz	tiou
Star	izar	siou	*Six*	sei	soou
Morning	goiz	atooni	*Seven*	zazpi	shashp
Evening	arrats	aroupi	*Eight*	zortzi	shmen
Sky	ceru	pe	*Nine*	bederatzi	psit
Wind	aiz	nibe	*Ten*	amar	met.

Amongst the other languages of Northern Africa, with which the Bask could, with any likelihood of success, be compared, I have found no more than is found in the Coptic: and, recognizing the bare possibility of the Alani, who, in conjunction with the Silingian Vandals, invaded Spain in the fifth century, having introduced it, I have brought even the Turk dialects within the range of my comparison; finding as little as I expected. Still, to some slight extent, the ground has been cleared. *Tentavimus hæc ne iterum tententur.*

The African affinities, however, few as they are, create a serious complication. They suggest the notion that the Bask language is not *in situ:* a fact which certain speculations concerning the old Celteberians support; these being to the effect that the Keltic element suggested by the name was the older, the Iberic, the

newer: the Kelts being aborigines, the Iberians intrusive. Hence, even the important preliminary question as to whether the Basque be the original language of the peninsula can scarcely be considered as finally settled; though the significance of the old geographical names therein is strongly in favour of it.

The exact geography of the Bask part of Spain gives us the Caristi and *Var*duli as the most definite ancestors of the present Biscayans and Na*var*rese. Roughly speaking, however, the indomitable Cantabri are fair representatives of the Old Bask spirit—the Cantabri belonging to Asturias rather than Biscay; in which province, however, Bask is still spoken. But the whole of Spain appears to have been what the north was; at any rate, the termination *-ani*, as in Carpet*ani*, *-uli*, as in Turd*uli*, *-bed*, as in the Idu*beda* Mons, and the Oros-*beda* Mons, are generally distributed. More characteristic still are the names of towns ending in *-gurris* and *-beris*, as Cala*gurris* and Illi*beris*: and, in a somewhat less degree, the forms in *-asc-*, *-ucca-*, *-br-*, *-murg-*, *-urc-*, *-issa-*, *-barc-*, *-lambr-*, as Mendascus, Morasgi, Vereasucca, Artabrum, Lacomurgis, Illurco, Nebrissa, Uxamabarca, and Flaviolambris.

With the distribution of these we may compare that of the Keltic elements. That the names for the River *Duria* and the Mons *Vinnius* are the Keltic *dwr* and *pen* is possible. If so, they are Keltic names for natural objects: which none of the others are. There is a town or two, like Seben*dun*um, in *-dun*, and, perhaps, a few places in *-mag*: but, as a general rule, the Keltic names are all of one sort—towns ending in *-briga*: many of which have, for their first element, the name of one of the Emperors, *e. g.* Augusto-*briga*, Julia-*briga*. These look as if they represented military colonies, with Gallic garrisons, rather than true Keltic localities—add to which, that they are found sporadically and indifferently all over the peninsula. Whatever may have been

the Keltic population of Celtiberia, all this is against its having been aboriginal.

As to the area of the Bask in France, there is no need to refine upon the statements which carry it as far north as the Garonne, and as far west as the Rhone. Clim*berris* and Illi*beris* are decidedly Bask names; though they will not carry us very far.

Individually, I think that (early though they show themselves in history) the Kelts of both the Narbonensis and Aquitania were intrusive; and that (say) a thousand years B.C. the Iberic and Slavonic frontiers touched at some point between the Rhone and the Alps. If so, the Keltic and Slavonic languages are the nearest congeners to the Bask which the *situs* suggests—and they are very distant.

Everything, in Bask, is an *af*fix, *suf*fix, or *post*fix, rather than a *pre*fix; *i. e.* the inflection is the preposition incorporated with the theme, and the *pre*position is a *post*-position.

What is roughly called the declension runs thus :—

mendis = *mountain*	mendiren = *mountain-of*
mendik = *mountain*	mendirekin = *mountain-with*
mendiz = *mountain-by*	menditako = *mountain-for*
menditan = *mountain-in*	menditarik = *mountain-from*
mendiri = *mountain-to*	menditarat = *mountain-towards.*

Insert *a* between the theme and affix, and it becomes definite :—

mendia = the mountain	*mendiarekin = the mountain-with.*

It is clear that the number of possible cases is that of the possible affixes. Some of these, however, express notions which are so different from those ordinarily represented by the case-endings of other languages that they are conveniently separated from the declension. More than this, they can themselves be declined; thus from *handi = great*, we get *handiago = greater*, *handishago = a little greater*, *handiegi = too great*, *handisheri = a little too great*, all of which may take the endings

in *tan, rekin, tako,* &c., and comport themselves as nominatives.

Like *mendi* are declined the personal pronouns, *ni* = I, *gu* = *we; niketin* = *me-with; gurekin* = *us-with ;* and, in like manner, *hi* = *thou ; zu* = *ye,* &c.

In this way, too, are declined all the pronouns and all the participles.

The possessive pronouns precede, the adjectives follow, the substantive. The Basks say *mea mater,* but *matres bonæ.*

When a substantive and adjective agree and come together the latter only is declined ; just as if we said in Latin *vir bonis* instead of *viris bonis.*

The possessives—*enia* = *my* or *mine, guria* = *our,* &c., seem to be little more than the pronoun *plus* the letter *a*—the definite article if we choose to call it so : indeed this, the postpositions, and the change from *a* to *e* in the plural seem to be chief, if not the sole factors in the declension. Of course there is great regularity, just as there is great regularity in English in the use of *to, by, on,* &c.

After recognizing the difference between (say) *voco* and *vocito,* let us extend it to many shades of difference between many verbs. That this will give us the basis of a number of moods and tenses is clear. But the form itself is, if not a *mood,* like *vocem,* a *mode.* Let it be called so, and instead of potentials, and subjectives, we may have inchoatives, frequentatives, desideratives, and what not? In this the Bask is rich.

Its deferential conjugation is another characteristic. Deferential modes of address are at their *maximum,* in the Oceanic languages : though found in either fragments or rudiments elsewhere. What is our fiction of treating the single person spoken to as two and saying, *you* for *thou* but this? Still, for a European language though in contact with the Spanish, the deferential style in Bask is highly developed.

The main dialects of the Modern Basque are (1) the Biscayan; (2) the Guipuscoan; (3) the Labourd; (4) the Soule—the first two exclusively Spanish. How they fall into sub-sections is seen from the following extracts of the apocryphal song of the Three Children, from the Bonaparte repertorium of facts on those points.

I.

Ordinary Biscayan.

1. Jaunaren obra guztiak, bedeinkatu egizue Jauna: alabau ta guztien ganetik goratu egizue beti.
2. Jaunaren Angeruak, bedeinkatu, &c.
3. Zeruak, bedeinkatu, &c.
4. Zeruen ganean dagozan ur guztiak, bedeinkatu, &c.
5. Jaunaren birtute guztiak, bedeinkatu, &c.
6. Eguzkia ta irargia, bedeinkatu, &c.
7. Zeruko izarrah, bedeinkatu, &c.
8. Euri ta iñontz guztiak, bedeinkatu, &c.
9. Jaungoikoaren espiritu guztiak, bedeinkatu, &c.
10. Sua ta beroa, bedeinkatu egizue, &c.
11. Otza ta beroa, bedeinkatu, &c.
12. Inoñtzak eta zurdea, bedeinkatu, &c.
13. Leya ta otza, bedeinkatu, &c.
14. Karraldoa ta edurrah, bedeinkatu, &c.
15. Gawak eta egunak, bedeinkatu, &c.

Ochandian.

1. Jaunen obea gustijek, bedeinketu eisuku Jaune: alabau da gustijen ganetik goratu eisube heti.
2. Jaunen Angerubek, bedeinketu, &c.
3. Serubek, bedeinketu, &c.
4. Seruben ganien daosan ur gustijek, bedeinketu, &c.
5. Jaunen birtute gustijek, bedeinketu eisube, &c.
6. Eguskije da iretargije, bedeinketu, &c.
7. Seruko iserrak, bedeinketu, &c.
8. Euri da iñontz gustijek, bedeinketu, &c.
9. Jaungoikuen espiritu gustijek, bedeinketu, &c.
10. Sube da berue, bedeinketu, &c.
11. Otza da berue, bedeinketu, &c.
12. Iñontzak da surdie, bedeinketu, &c.
13. Leije da otza, bedeinketu, &c.
14. Leije da edurrek, bedeinketu, &c.
15. Gaubek da egunek, bedeinketu, &c.

Marquenese.

1. Jaunaren obra guztijāk, bedeinkatu ezigube Jauna: alubau ta guztige ganetik goratu egizube beti, &c.

2. Junnaren Aingerubāk, bedeinkatu, &c.
3. Zerubāk, bedeinkatu, &c.
4. Zeruben gānian dagozan ur gustijak, bedeinkatu, &c.
5. Jaunaren birtute guztijāk, bedeinkatu, &c.
6. Eguzkija ta illargija, bedeinkatu, &c.
7. Zeruko izarrāk, bedeinkatu, &c.
8. Euri ta iñontz guztijak, bedeinkatu, &c.
9. Jaungoikuaren espiritu gustijak, bedeinkatu, &c.
10. Sube ta berua, bedeinkatu, &c.
11. Otza ta berua, bedeinkatu, &c.
12. Iruntzāk eta intzierra, bedeinkatu, &c.
13. Iyotza ta otza, bedeinkatu, &c.
14. Iyotza ta edurrāk, bedeinkatu, &c.
15. Gabāk eta egunāk, bedeinkatu, &c.

II.

Guipuscoan (Central).

1. Jaunaren obra guztiyak, bedeinkatu ezazue Jauna, alabatu eta guztiyen gañetik goratu ezazue beti.
2. Jaunaren Aingerubak, bedeinkatu, &c.
3. Zerubak, bedeinkatu, &c.
4. Zeruben ganian dauden ur guztiyak, bedeinkatu, &c.
5. Jaunaren birtute guztiyak, bedeinkatu, &c.
6. Eguzkiya ta illargiya, bedeinkatu, &c.
7. Zeruko izarrak, bedeinkatu, &c.
8. Euri eta intz guztiyak, bedeinkatu, &c.
9. Jaungoiknaren espiritu guztiyak, bedeinkatu, &c.
10. Suba eta berua, bedeinkatu, &c.
11. Otza ta berua, bedeinkatu, &c.
12. Intzak eta intziarra, bedeinkatu, &c.
13. Izoztea eta otza, bedeinkatu, &c.
14. Izotza eta elurrak, bedeinkatu, &c.
15. Gabak eta egunak, bedeinkatu, &c.

Guipuscoan (2).

1. Jaunaren obra guziak, bedeikatu ezazute Jauna : alabatu eta guzien gañetik goratu ezazute beti.
2. Jaunaren Aingeruak, bedeikatu, &c.
3. Zeruak, bedeikatu, &c.
4. Zeruen gañean dauden ur guziak, bedeikatu, &c.
5. Jaunaren birtute guziok, bedeikatu, &c.
6. Eguzkia ta illargia, bedeikatu, &c.
7. Zeruko izarrak, bedeikatu, &c.
8. Euri eta intz guziak, bedeikatu, &c.
9. Jaungoikoaren espiritu guziak, bedeikatu, &c.
10. Sua eta beroa, bedeikatu, &c.
11. Otza ta beroa, bedeikatu, &c.
12. Intzak eta intziarra, bedeikatu, &c.

13. Izotza eta otza, bedeikatu, &c.
14. Orma eta elurrak, bedeikatu, &c.
15. Gauak eta egunak, bedeikatu, &c.

III.

Upper Navarre (Baztana).

1. Yaunaren obra guziat, benedika, zazue Yauna: lauda eta guzien ganetik goratu zazue beti.
2. Yaunaren Aingeruak, benedika, &c.
3. Zeruak, benedika, &c.
4. Zeruen gañean dirin ur guziak, benedika, &c.
5. Yaunaren birtute guziak, benedika, &c.
6. Iguzkia eta ilargia, benedika, &c.
7. Zeruko izarrak, benedika, &c.
8. Uri eta intz guziak, benedika, &c.
9. Yaungoikoaren izpiritu guziak, benedika, &c.
10. Sua eta beroa, benedika, &c.
11. Otza eta beroa, benedika, &c.
12. Intzak eta izotza, benedika, &c.
13. Izotza eta otza, benedika, &c.
14. Orma eta eturrah, benedika, &c.
15. Gavak eta eguanak, benedika, &c.

Laburtanian.

1. Yaunaren obra guziak, benedika zazue Yanna: lauda eta ororen gainetek alcha zazue bethi.
2. Yaunaren Aingeruiak, benedika, &c.
3. Zeruah, benedika, &c.
4. Zeruen gainean diren ur guziak, benedika, &c.
5. Yaunaren berthute guziak, benedika, &c.
6. Iguzkia eta ilhargia, benedika, &c.
7. Zeruko izarrak, benedika, &c.
8. Uri eta ihintz guziak and benedika, &c.
9. Yinkoaren iziritu guziak, benedika, &c.
10. San eta beroa, benedika, &c.
11. Hotza eta beroa, benedika, &c.
12. Nintzak eta izotza, benedika, &c.
13. Izotza eta hotza, benedika, &c.
14. Horma eta elhurrah, benedika, &c.
15. Ganak eta egunak, benedika, &c.

Lower Navarre (Baigorres).

1. Yaunain obra guziak, beneika zazi. Zazī Yauna: lauda eta oroin gainetik alcha zazi bethi.
2. Yaunain Aingeriak, beneika, &c.
3. Zeriak, beneika, &c.
4. Zerien gainian diren ur guziak, beneika, &c.

Even with a reconstitution of its grammar the Bask stands alone. It stands alone when all allowance has been made for the effects of displacement and encroachment on its frontier. If *in situ*, it ought to be nearer the Keltic and Slavonic than it is. If African, it ought to be more Berber, Coptic, Hawsa, Sungai, than it is. If introduced by the Phenicians (a bare possibility, but entertained as such in order to clear the ground), it ought to be more Semitic than it is: and if Scythian, introduced by the Alans (a barer possibility still, but entertained for the same reason), it should be more Turk than it is. As far as its grammar and phonesis goes, it is, certainly, more Ugrian than aught else —a fact which is, to some extent, in favour of the Fin hypothesis, and against the views of the present writer. Still, the Ugrians may possibly (though not probably) have covered Western Europe, and, yet, left room for the so-called Indo-European languages in the more central parts. I do not hold this to have been the case. I only hold that such a primeval distribution of them is compatible with the European origin of the European languages. I admit any amount of *more or less* in the question. I only hold that they were never in Bohemia, Italy, Greece, and elsewhere, to exclusion of the Slaves, Latins, and German from each and every part of the wide districts west of the Dardanelles. The Fin hypo-

thesis which requires all Europe for some population anterior to the chief Europeans, and Asia as the home and origin for them, is the Fin hypothesis I oppose.

With the present tendency of certain opinions among the naturalists, opinions which recent speculations upon recent facts have led to favour the claims of the *genus* Homo to a high antiquity, it is scarcely superfluous to say a little upon a question even more transcendental than the Fin hypothesis. They suggest the possibility of certain outlying members of our kind having belonged to certain continents now under water. One of these, or a part of one, was in the parts beyond Spain. If so the Bask area may be the remains of a vast Atlantic system, of which Madeira and the Azores are fragments, belonging to the Miocene period.

If the language belong to this, it forms a class of equal value with all the other languages of the world put together. But the proper geological evidence of mankind having existed at this period is wanting; so that we had better confine our attention to an accurate valuation of the peculiarities which have supplied the text of the preceding overlengthy dissertation—peculiarities which, great as they are, have possibly been exaggerated. Not only may the Bask be liker to other languages than it is considered, but other languages may be liker to the Bask. A Greek grammar which made, out of words like *οὐράνοθεν* and *οὐράνονδε*, cases, (as, upon Fin principles, it might,) would do something towards an approximation. The differences that grammatical manipulation makes it may also unmake. Before this problem is thrown-up as insoluble let some competent Slavonic and Keltic scholar consider what may have been the condition of each of their respective languages in an early period of the agglutinate stage, and then compare it with the Bask.

CHAPTER LXXXII.

General Remarks upon the Indo-European Class.

In several of the preceding notices there is so much at variance with the doctrines of the highest authorities that the present chapter must, perforce, be, to a great extent, purely critical: the points whereon the little that our space allows an opportunity of writing being four in number, viz. (1.) the value of the primary and the subordinate groups; (2.) the European origin of the Sanskrit; (3.) the original area of the Slavonic; and (4.) the stage of the Keltic.

(1.) Of the outlying character of the Skipitar we have a good measure in the fact of its having been, with the doubtful exception of the Keltic, the last to be recognized as Indo-European.

That the value of the classes is *exactly* what it is said to be is scarcely likely. Few such valuations run quite on all fours. It is well, however, to indicate them; inasmuch as nothing is more productive of careless philology than the otiose belief that when once you have got a class of languages it matters little whether one or the other be the nearest congener of a third. It is held, for instance, to be a serious error to treat the Sanskrit at one time as if it were as much Greek as Latin, at another as if it were as much Slavonic as German. This class, like all others, arranges its members round some common centre, and the nearer two languages are

to the two extremes the greater the difference between them. In the present group it is the Slavonic languages which are the centre, from which the Greek and German are, decidedly, more distant than the Latin and the Sanskrit.

The magnitude of the group itself is involved in the doctrine explicitly stated in the first chapter, that the distance of groups from each other is determined by the amount of the actual or hypothetical obliteration of the transitional forms, and implicitly suggested, by almost every page of the work, in the doctrine that, if it were not for these obliterations, forms of speech would graduate into each other. If so, it is clear that it is a mere waste of power for one writer to circumscribe a class of languages by means of a particular denomination, and for another to show that some member of some other class has a certain amount of affinities with it.

That this is done largely is true, and it is a pity that it is as true as it is. Most of the so-called discoveries and generalizations in Comparative Philology consist in some one correcting an overdrawn distinction of some one else's. Hence, it must create no surprise if we hear that certain Asiatic languages have European characteristics of an important kind. Their existence is not denied. It is only asked whether they are numerous enough to make (say) the Armenian or the Fin allied to (say) the Slavonic or the Latin as those two languages are to each other. If they fail in this they fail altogether; being merely facts in favour of the fundamental unity of languages in general; facts of great importance in their proper place, but irrelevant in a question of classification, where we deal not with mere affinities but with affinities in their different degrees.

Those, however, who have not taken this view, have, after making the Persian Sanskrit, made the Iron Persian, and the Georgian Iron. Others have made the Malay Indian: others, the Fin and Armenian, Indo-European

in general. All this (except in the eyes of those who deny an affinity of any kind) is merely raising the value of a class; which is, in other words, merely altering the import of a term. This is legitimate enough, provided that fair notice be given of exactly what is done, and if any good come from the change. All, however, that is, at present, apparent is, that if we take one language into a given class we must take its congeners —and where this will end few know beforehand. The persons of the verbs, especially in the first person, are very permanent. They seem to have been adopted as inflections early, and to have been kept long. They occur in languages which, in other points, differ notably. They are common to the Iron and the Armenian. If this make those languages Indo-European, well and good. But they also occur in the Lap. If this make the Lap Indo-European, better still. But all Caucasus must follow the Iron, and all Siberia the Lap. Then, with the outliers of Caucasus, there are Tibetan, and with the outliers of Siberia, American affinities. When are we to stop? Only when the whole world shall have made one great class which has to be divided afresh. But that is where we begun.

(2.) Of the European origin of the Sanskrit it is held that enough was said when the presumptions against the Asiatic origin of its undoubted European congeners was stated. It showed where the *onus probandi* lay.

Upon its value, however, as a language, much depends upon the relation which it bears to the modern dialects of India. If it be the mother-tongue of them it shares with the Latin, the Greek, and the German, the merit of giving us an older and a newer stage of growth; and, so doing, rivals those languages in value as a philological *datum*. There are no reasons, *à priori*, why it should not do this; or rather (roughly speaking) the presumptions on each side are equal. The Sanskrit may have

fixed itself in India as the Anglo-Saxon did in England. Or it may have fixed itself only after the fashion of the Anglo-Norman. The actual fact must be determined by examination.

A common way of speaking of the modern languages of Northern India is to say that they contain nine out of ten, eight out of ten, five out of ten, or any number out of any other number, as the case may be, of Sanskrit words —the maximum being in either the Hindí or Bengali, the minimum in the Mahratta. This may or may not be the case. The details, however, have never been given, except in the way that the pedant of Hierocles gave the details of his house by showing a brick. Say, however, that the fact is, to a great extent, true. Nineteen-twentieths would not prove a lineal descent unless the field over which the induction extended were sufficiently wide. An Englishman who goes through the letter A in Johnson's dictionary scarcely finds one word in fifty of Anglo-Saxon origin, though in B he finds a preponderance of them, and in K a larger one.

Again, many of the comparisons are founded on the translations of the Lord's Prayer, a series of sentences which pre-eminently requires, in most rude languages, exotic words. The real *data* lie in the unwritten local dialects, of which we know little. Yet the more we know of them the more we find them containing elements other than Sanskrit.

Another assumption is, that everything (with few exceptions) which is common to the Indian vernaculars and the learned language is treated as if the borrowing were all on one side—all on the side of the vernacular, and nothing on the side of the learned, language. Yet such is rarely the case. The only undoubted Sanskrit elements are those which are Greek, Latin, Slavonic, Lithuanic, or German as well. The others may or may not be aboriginal. Some of them, in all probability, *are* so.

In the matter of grammar, the reader of the present work can, to some slight extent, judge for himself. If he know French and Latin, let him compare the grammar of the former language with that of the latter. Let him see how they agree and how they differ ; let him then compare the Sanskrit inflections with the Hindí or Punjabi. Great as is the difference between the French and Latin, the difference between the two Asiatic tongues is greater. What likeness the Mahratta, &c., in the way of grammar, bear to any languages at all, is borne to languages in other quarters.

The relations of the Persian to the language of the Achæmenian inscriptions are by no means the parallel of the relations of the modern languages of India to the Sanskrit. The Persian can be traced through the Parsi to the Huzvaresh. Can the Huzvaresh be traced to the Persepolitan ? The presumptions balance each other. If the Persepolitan can fairly be compared, *à priori*, with the Anglo-Norman in England, it can also, *à priori*, be compared with the Anglo-Saxon. The result lies in the details of the facts. On these, the writer has no means of passing an opinion. Upon the Sanskrit and its Western origin he spoke, not as a scholar, but as a logician. In Persia, however, where there is less play for for the antiquarian imagination than in India, there is less to be condemned on merely general grounds.

Still, it is probable that those points of grammar wherein the Persian is Indo-European are *not* the result of Indo-European descent. They may be of the same kind as the personal endings of the verbs in the Iron, Fin, and Armenian, a fact which connects itself with another, which will be noticed in the sequel. Meanwhile, the classification just suggested is the one which, subject to correction, is adopted in the present volume.

Whether we deduced the Sanskrit from Asia or Europe its affinities with the languages of Armenia and the districts around would be nearly the same. As an Asiatic

language it would touch them on its western, as a European one, on its eastern extremity. Hence, in either case, we get a *situs* which supplies *some* affinities. One of the difficulties in making the Persian Indo-European lies in its relations to the Iron, which is essentially Dioscurian—so much so that, on the strength of these very affinities, Bopp makes the Georgian (which is, undoubtedly, Dioscurian) Indo-European. This is but a different reading of the same fact. To the fact itself it is very decided evidence; though, like many others, it proves too much.

To conclude: it by no means follows that, because a writer doubts as to the modern languages of India being of Sanskrit origin, he, therefore, makes them Tamul. The fact of the Brahui being, at one and the same time, Tamul in its affinities and Persian in its locality, suggests the possibility of even the Tamul family having been originally of foreign origin. Other reasons suggest the doctrine that, at a very early period, the congeners of the Himalayan languages reached from the Ganges to Cape Comorin; so that the Sanskrit belongs to the third rather than the second layer of languages introduced from without. This, however, is a point which, in the present work, is only to be taken as a suggestion. It is certain that, in many respects, the Ghond, Khond, and Kol tongues are largely Himalayan, Tibetan, Nepalese, or whatever the class to which the languages of the northern frontier of India belong, may be called.

(3.) That the early area of both the Lithuanians and the Slaves was very different from what it is at present, has been suggested. The limit of the Slavonic on the south-west has not, however, been considered: the original extent of the Keltic and German tongues eastward and southward being one of the preliminaries to its consideration. I find no occasion for carrying either the original Germans to the south of the Mayn or the Iberians and Gauls much beyond the Rhone. On the con-

trary, I find some reasons for believing that some Slavonic form of speech of which the present Tshek is the nearest existing representative extended both far to the west and far to the south of the present Slavonic frontier.

Indeed, I carry it as far as Savoy; the reasons for which I hope to exhibit in some special monograph. They lie chiefly in the Slavonic character of numerous local names in the Alps: especially in the root *k-m-n* = *rock*, and *k-r* = *boundary*, which I hold to be the etymons of the Val *Camunica*, *Chamouni*, *Ingria*, the Alpes *Graiæ* and many other obscure names. These (two out of many) are given as illustrations of the criticism applied to the question rather than as anything which can be mistaken for even approximate evidence.

(4.) The Keltic, in respect to its stage, I place in the same class with the Ugrian, &c., rather than in that of the English and the French; so that what are fragments of inflection in the eyes of the best Keltic scholars are, in mine, rudiments. That there are minute facts in favour of the opposite opinion which I cannot deal with offhand, I admit. Still, under a general view of the subject the main principles are these. There are a few languages concerning the stage of which there are *doubts*, and there are the modern descendants of the Latin, the Greek, and the old German, of which the advanced character is *beyond* doubt. With these three we may begin as absolute and primary *data*, and with no others. Will anyone, after a due consideration of the real characteristics of the English, French, Romaic, Danish, and Swedish, say that they are to be found in the Gaelic and British? Let anyone generalize the *differentiæ* between a language in the fourth and a language in the second stage, and he will know what to answer.

Here the English column not only translates the other languages, but stands as the representative of the German group.

PART II.

CHAPTER I.

Language in General.—Stages.

LANGUAGE *begins* with voice. The language of the eyes is a mere metaphor. Gesticulation on the part of men and women is mere mimesis. Movements on the part of the lower animals, however much they may express, are merely dumb show.

Language *ends* with voice. *Written* language, as a *genus* of speech, is a misnomer. It is a mere record, register, or representation; and is as different from real language as a portrait is from the person who sat for it.

Whether every significant vocal sound be conveniently called language is another question. If it be, laughing, crying, and groaning give us language. This, however, may be disposed of by dividing language into *articulate* and *inarticulate*.

As there is no reason to believe that the vocal sounds uttered by the lower animals are destitute of significance, we cannot deny to the great mass of air-breathing animals an inarticulate, or, at least, an imperfectly articulate, language.

Every animal that can make its breathing heard can make an approximation to the sound of *h*. When it does this by drawing-*in* its breath there is an *in*spira-

tion. When it does it by giving it *out* there is an *ex*-piration. *H*, then, though an articulate sound (inasmuch as it can be united with other sounds so as to form syllables) is scarcely a *vocal* one. Its connection is with respiration rather than language. It is common to man and all the air-breathing animals.

Vocal sounds begin with the batrachians. Snakes can utter hisses which are of the same degree of sonancy as the letters which we call sharp or surd, *i. e.* the sounds of *p*, *f*, *t*, *k* and *s*. Sounds of the same degree of sonancy as *b*, *v*, *d*, *g* and *z* they cannot utter; though most of the batrachians can. The other sounds to which the nearest approach is made by the lower animals are those of *b*, *m*, and *n*, by sheep, oxen, and horses, respectively. They are those which require the least special aptitude on the part of the tongue. The sounds of *v*, and *f*, which require the contact of upper teeth and the under lip, are harder. So are those of *t* and *d*, requiring a delicate manipulation of the tongue and teeth.

The nearest approach to a true articulation, *i. e.* the union of one elementary sound to another, is exhibited in the *mu* and *baa* of oxen and sheep.

No animal has the command of two consonantal sounds. No one articulates freely and distinctly.

Domestic animals have the greatest compass; and it is probable that this is due to the imitation of man, rather than to any special organization. Parrots and starlings confirm this position. The simiadæ, which are *not* domesticated, approach man nearer in shape than voice.

Human language begins when the elementary sounds are combined so as to form syllables; in which case they are not only articulate but articulated.

The case of syllables consisting of only a single sound is, here, put out of the question. Indeed, etymologically speaking, they are not *syll*ables. In this case (a hypothetical one) language consists of nothing but interjections: using the term with sufficient latitude to include

commands like *go*, vocatives like *puss*, and demonstratives like *lo !*

A *word* may either coincide with the syllable, or exceed it—*i. e.* it may be monosyllabic or other than monosyllabic. That no word is unnecessarily long is an inference *à priori*, suggested by the rule which forbids us to multiply causes unnecessarily. The deduction from it, that all roots were originally monosyllabic, partakes of this *à priori* character ; and, although it is, to a great extent, borne out by actual investigation, it can scarcely be taken absolutely and applied indiscriminately. In a rough way, however, and provisionally, most philologues, either consciously or unconsciously, act on it.

Syntax, or the combination of words in a state of mutual relation to each other, begins when out of two or more words we deliver either a proposition or the part of one.*

Agglutination begins when one of two words in a syntactic relation to one another, is so subordinated to its fellow that it undergoes a change in either form or meaning—*à fortiori*, when it does so in both.

To this it should be added that the change need not be a change of its component articulate elements. It is enough if it be a change of accent. Indeed, the change of accent is, in many respects, the more important one of the two. A word thus affected becomes *enclitic*. Hence we may say that agglutination begins when one of two words becomes enclitic or suffers any greater change than that term implies.

* I think that the term Syntax may fairly be used here ; because, though even when there are no inflections and no approach to them (so that the phenomena of concord, government, and the like, are out of the question), there is still the necessity for some *Syntaxis* or *Arrangement*. This, of course, consists in the order in which the words follow each other, *i. e.* in position. Without, then, pressing the term, I submit that, in a proposition consisting of two or more words differently arranged, there is not only a difference but a difference of what may conveniently be called Syntax.

When one word in a language is thus affected, the language to which it belongs is, *pro tanto*, agglutinate, and when all the words are thus affected, the whole language becomes so. Between these two extremes there is every intermediate degree. When, however, a notable majority has thus presented the phenomenon of agglutination, the language, unless there are other reasons against it, may be classed as Agglutinate.

Inflection begins when a word originally enclitic loses its capability of being separated from its principal and being presented in an isolated form.

When the word has not only lost its individuality, but is so far transformed as to be incapable of being explained, *i. e.* incapable of having its original form re-exhibited, the inflectional character has taken the most decided form it is capable of taking.

When one word in a language is thus affected, the language to which it belongs is, *pro tanto*, inflectional; and when all the words are thus affected the whole language becomes so. Between these two extremes there is every intermediate degree. When, however, a notable majority of words has thus presented the phenomenon of non-individuality, the language itself, unless there are reasons against it, may be classed as Inflectional.

Inflections may be lost: the loss of them being either pure and simple, or attended with the evolution of some equivalent circumlocution. When one inflection is thus dropped, the language to which it belongs has, *pro tanto*, departed from its inflectional character, and when all inflections are dropped, the whole language has become something else. Some writers apply the term *analytic* to this stage; but there is no good name for it. It is, however, the stage which the English and French, as contrasted with the Anglo-Saxon and the Latin, represent.

Simply considered with a view to their want of in-

flection, languages in their fourth resemble languages in their second stage. The resemblance, however, is only apparent ; in other words, there is no such thing in language as a true anamorphosis, *i. e.* a simple repetition of the same forms. The prepositions and auxiliar verbs which, in many cases, serve as equivalents to the ejected inflections, are of a more general and abstract character than the words used in the infancy of language. Again ; inflections often impress on the main word certain secondary changes, which may remain as effects after the inflection out of which they originated has departed. The difference, however, between the fragments and the rudiments of an inflection has already been noticed.

In whatever way language originated it is by imitation that it is propagated. With the exception of the cry uttered by the infant at birth, which is a purely reflex action, and which is of the same kind for infants of all nations and countries, with the addition of, perhaps, a few others, everything that is uttered by the child is the effect of imitation. He speaks as others speak about him, as he has heard them speak, and as he strives to imitate them. Hence all known philological phenomena are facts in the history of the communication, reception, and representation of language rather than facts in its birth, or origin. They all assume a language as it is—ready-made and previously existing. They are facts of transmission rather than of aught else.

After a time, however, simple imitation ceases, and differences between the speech of two or more speakers develope themselves. Of that particular form of his mother-tongue which any individual uses, the speaker is thoroughly, and in every sense, the master. He uses it as an instrument of his own. He uses it as he uses his arms and legs ; to a great extent unconsciously, but almost always instinctively. He

cannot err in this, so long as he is at one and the same time, unconscious, spontaneous, and intelligible. If he think about grammar, and, by so doing, modify its spontaneity, it is, *pro tanto*, a language influenced *aliunde*. In all cases, however, it is the only language he understands in full. As long as he speaks it simply from his instincts, it is in good grammar; being simply what he makes it. What is called bad grammar is a detail in which he differs from some one else who calls *his* form of speech good grammar. This means that there is no such a thing as bad grammar. For every apparent solecism there is a reason. If it were not so, bad grammar would be a force exerting itself *as such*. That these reasons have been but imperfectly investigated is true, and it is true that the imperfect investigation which has neglected them so thoroughly passes for a good one, as to have obscured the philological truth that *whatever is, is right*. Such, however, is the fact: whatever comes spontaneously comes naturally, and whatever comes naturally is a growth which we must take as it comes, and not regulate by any preconceived notions. The real bad grammar is on the part of those grammarians who venture to lay down rules for the representation of language which they cannot complete, rather than on that of the speakers. To cut down language to grammar is to regulate faces by pictures of them.

The man who, instead of *I am*, says *I are*, so speaks because the unconscious analogies which regulate his expression suggest these words. What he does others will do also. Of such as do so all that can be said is, that they use a dialect which is limited to the illiterate; and, amongst them, only to those who are within the range of a certain set of philological influences. Yet, if these men formed a community by themselves in (say) an island of the Pacific, and were visited by a missionary there, who formed his grammar solely on what

he found, and, by forming such a grammar, had fixed the language, the vulgarism would become classical; for, if the language stood quite alone, there would be no means of seeing that (even in the eyes of the grammarian) it had once been what he would call wrong. No one calls *jeg er*, bad Danish. Yet, word for word, it is the English *I are*. In Danish, as in English, there was the older form in *-m;* and in Danish, as in English, some one spoke what is called bad grammar when he, for the first time, used the form in *-r* in its stead. In Denmark, however, the so-called bad language has prevailed, *i. e.* has become good.

But how was it that the bad preference set in? We cannot say. This, however, we can say—that it was determined by the forces which determine the growth of language; and that, as a force, it is as little to be condemned as the conservative force which would have resisted it is to be praised. Each is simply to be investigated; in the neglect of which investigation lies the real fault, whatever that may be.

It does not follow, however, from this, that there is no such a thing as bad grammar. The term has two meanings. It signifies the actual representation of a language, and the formal scheme of a language. Language, as a fact, must be taken as it is, and represented as it best may be. Nevertheless there is a standard by which it must be measured. In one sense the words *myself* and *himself* are good English; so good that men may be laughed at for saying *his-self*. In another sense, one of them must be wrong. If *self* mean *exactly* the same in each compound, and if the two compounds stand in *exactly* the same ratio to the pronouns *I* and *he*, and if *my* and *him* be in decidedly different cases, there must be something wrong somewhere; the wrong being a formal one.

The rule in English that *two negatives make an affirmative* is, as a rule of language, absolutely incom-

patible with the rule that *duæ aut plures negativæ apud Græcos vehementius negant*, so long as we keep the word *negative* to one precise signification. By making the second negative, however, an expletive, by ignoring it altogether, or by making it express, in some vague manner, the mode of the negation, we can reconcile the two.

Again—whatever may be the origin of the sign of the first person in verbs, it is beyond doubt that, in certain stages of certain languages, it was the equivalent to the first personal pronoun as the name of the subject of the proposition. This is what the *-m* in *am* is: just like the *-μι* in *εἰμί*. When *I am*, then, was first said there was one of four things. The combination meant *the I which is is I;* or *I, I am* with emphasis; or it was a simple piece of tautology; or the *-m* was entirely merged in the *a*. So far as it was purely tautological, it was (so far as grammar is formal) a paralogism. Yet it was, and is, a fact in language; and its evolution was the effect of some philological force which it is the business of philologues to elucidate. Anything short of this, such as the mere condemnation of certain expressions on the score of bad grammar, is only cutting the knot when it ought to be undone. There is, doubtless, wrong somewhere; but the language adopts the wrong, and the language we must take as we find it: in other words, the wrong rights itself. And this (if we may speak in metaphors without coming under the charge of haziness) is the fact. Wrongs in language have a tendency to right themselves; language itself being, at one and the same time, in a state of unstable equilibrium and incapable of disorganization.

Its primary function is to be a medium of communication, and it is impossible to imagine any natural change in it which is not regulated by the conditions herein applied. Men and women may have more or less to say according to the range of their wants

and experience; but if language, at all times and in all places, stands in the same relation to its ideas as an exponent, it is equally good as language. What certain changes do is this—they modify the particular phases of the language, and, so far as they do this, change its individual character.

Lest this should be thought incompatible with the acknowledged fact that languages differ from each other in copiousness, harmony, and development of inflection; lest it should seem to cut at the root of the doctrine implicit in much of what this work is intended to convey, I guard against any misinterpretation of my meaning by saying (what is, perhaps, superfluous) that a language representing a high state of civilization is one thing, the manner in which it represents it is another. All that is here argued is that, given a certain range of ideas on the part of the speakers, all languages represent it with an equal degree of adequateness—the relation of the language, as a medium to the ideas represented, being constant. A picture of a stunted idiot is as good, as a mere representation, as the picture of equal artistic skill of a genius, an athlete, or an Antinöus. The matter alone differs. The relation of the representation, supposing it always to be adequate, (as it is held to be in the case of language,) is the same.

CHAPTER II.

On Classes, and affinity.

OBSERVE, in the remarks upon the several stages in which languages are to be found, the word *classed*. Roughly and practically speaking, a language may be agglutinate or inflectional, and yet, on the first view, cannot be treated as such, without inconvenience. Such is the case when it belongs to a large class, wherein its congeners are in a different stage of development. It is only, however, laxly and superficially that this exception holds good. The real view is, that agglutination or inflection, as the case may be, is to be treated as a single character overbalanced by others. Some of the Ugrian forms of speech exhibit this complication. Their congeners are agglutinate, whereas, the Fin is (in the eyes of many) at least sub-inflectional. Still the original classification holds good; inasmuch as we classify by affinity, rather than form.

Languages, in other respects but distantly related, may agree with each other by being in the same stage: this being agreement without affinity. Languages, on the other hand, closely connected with each other in the way of descent, may be in different stages; in other words, languages are related to each other according to the time at which they are either known or believed to have diverged from some common stock.

Differences in the rate of change, complicate, without altering, this principle.

How far physical conformation coincides with blood, or descent, is another question; a question that belongs to

the ethnologist almost exclusively. It is a question upon which many extreme opinions are afloat; but it is not a question upon which the study of language has any *direct* bearing, though it is one upon which many philologists have committed themselves.

Several of the writers who have done me the honour of either adopting or disparaging my opinions have been pleased to look upon me as an investigator who lays undue value upon the evidence of language as a test of ethnological affinity. Having written on philology before I touched the study of medicine, I may, many years ago, have held opinions that justify this view. I am not, however, aware of having ever expressed them in any published work, or, indeed, of having entertained them at all for upwards of twenty years. In all works on ethnology, philology must preponderate; simply because the facts of language are numerous, definite, and, above all, capable of being studied anywhere and at all times, at first, or second, hand; in the closet, or museum, as well as in the country or open field. But identity of language is, at the most, only a presumption in favour of identity of blood. Being this, it must stand as an important test—a provisional test no doubt; but, still, as a test that is satisfactory and valid so long as nothing is brought against it. It fits, however, but loosely.

It is clear that changes in the physical conformation of a population of speakers and changes in the language they speak may go on at different rates. A thousand years may pass over two nations undoubtedly of the same origin, and which were, at the beginning of those thousand years, of the same complexion, form, and language.

At the end of those thousand years there shall be a difference. On the one the language shall have changed rapidly, the physical structure slowly. On the other the physical conformation shall have been modified by a

quick succession of external influences, whilst the language shall have stayed as it was.

With an assumed, or proved, original identity on each side, the difference in the rate of action on the part of the different influences is the key to the discrepancies between the two tests. The language may remain *in statu quo*, whilst the hair, complexion, and bones change; or the hair, complexion, and osteology may remain *in statu quo*, whilst the language changes.

Apparently this leaves matters in an unsatisfactory condition; in a way which allows the ethnologist any amount of assumption he chooses. Apparently it does so; but it does so in appearance only. In reality we have ways and means of determining which of the two changes is the likelier.

We know what modifies *form*. Change of latitude, climate, sea-level, conditions of subsistence, conditions of clothing, &c., do this; all (or nearly all) such changes being physical.

We know, too (though in a less degree), what modifies *language*. New wants gratified by objects with new names, new ideas requiring new terms, increased intercourse between man and man, tribe and tribe, nation and nation, island and island, oasis and oasis, country and country, do this. It is our business to learn from history what does all this.

In the assumption of an original continuity (running through the whole of this book, though subject to correction from new facts) of allied forms of speech there is, doubtless, hypothesis; and in the doctrine of the obliteration of intermediate forms and the outcrop of affinities there is hypothesis also. How much? In the facts themselves none. The hypothetical element, such as it is, lies in the application of them. For the French, Italian, and Spanish, the former is a matter of history. It has gone on to some extent already. To some extent it is going on before our

eyes at the present time. In like manner, the outcrops of the Fin languages, which lie in fragments like islands in a Russian sea (as aforesaid), are simple facts—without an atom of hypothesis in them. The nearest congener of A is not the contiguous B but distant C. It accounts, then, for something. The present writer makes it account for much; perhaps for too much. Let those who differ with him, then, take exceptions to his several applications in detail, each on the merits of the particular case; not to the primary fact. The primary fact with a partial application is a truism. How far it extends is a case of *more or less.*

Coincidence is an actual fact in more parts of the world than one. As a general rule, however, neither the phonesis of a language, nor the stage of its development, are of much value in a question of relationship —at any rate, they are not of primary importance. Neither is the character of the grammatical structure. Of two nations closely allied the one may prefer prefixes to postfixes, whilst the other uses the postfix rather than the prefix; or, again, two languages may agree in preferring prefixes which agree in little else. In the way of generalizing the phonetic and ideologic character of large groups of languages much good work has been done. For the investigation, however, of affinities a great deal of it is out of place. It is only to a certain, though, doubtless, to a considerable, degree that languages genealogically allied are also in the same stage of development. This means that no single character is worth much.

We may have, however, likeness without a corresponding affinity. Some thousand years hence, when the differences between the English of America and of Australia will have notably increased, the genitive cases in *-s* may still exist. Their history will be known. They will be known to have existed in the mother tongue at the time of the division of the languages, and that as signs

of the genitive case. They will, therefore, represent an inflection ready-made in or before the nineteenth century: facts which will amply account for their existence elsewhere and at a later period. They *might*, however, represent something else. It might be that all that the Australians on their part, and the Americans, on theirs, took with them from their mother-country was a series of uninflected substantives, a short word of which the letter *s* was the main element with a meaning akin to the meaning of the inflectional *s*, and a tendency to combine the two. In this case the combination itself would have been effected within each of the two countries at a period subsequent to the division from the mother-tongue, and independently, as far as the combination went, of the mother-tongue itself.

But it was not *so*: as the critics of the time in prospect will know from history. It was not so; for the inflection was part and parcel of the paradigms and scheme of the mother-tongue. Let us call an inflection of this kind—imported rather than developed—*schematic*.

Schematic inflections tell us that the languages in which they appear broke off from the mother-tongue during a stage of its development sufficiently advanced to be, *pro tanto*, at least, inflectional.

With the other alternative the case is different, and separation took place during a stage of which all that can be said is, that a tendency to inflection existed, and that the elements out of which it was evolved along with the tendency to combine them, existed also. This stage was, of course, an earlier one.

Nevertheless, a separation during the inflectional stage is simulated.

This is no hypothetical case; on the contrary, it is a real one. The root of the Latin *se*, the so-called reflective pronoun, is common to the Norse and Lithuanian languages. It is common to many other forms of

speech besides; but these two are the only ones now under notice. The Lithuanians append it in the way of an agglutination to the verb, making thereby an approximation to a reflective, or middle, voice. The Scandinavians did the same. They did more. Within the historical period we have seen this same reflective pronoun (1.) as a full appendage like *kalla sik* = *call himself;* (2.) as a modified appendage, *kallasc*; (3.) as *kallast*, applying to all three persons, and meaning not only *call himself*, but *call one's self, call thyself, call myself, call ourselves, yourselves*, and *themselves*; (4.) as *kallas* and *kalles*, in which forms it is treated both in Danish and Swedish as an ordinary passive voice. Now, if it were not for the older forms we might never have known all this; and if it were not for the known newness of its origin, we might fancy that it originated at a period when the mother-tongues of the Norse and Lithuanian were one. We might, also, entertain the notable blunder that, as it is wanting in the allied languages of Germany and England, it is the fragment of a full inflection once possessed by the whole class.

Let the Lithuanian and Norse middles be called *isomorphic.*

If isomorphic combinations be something less as signs of affinity than schematic the forms which we are about to call *isomeric* are somewhat less than isomorphic. In Norse and Rumanyo the article is post-positional, *i. e.* the former language has *mand* = *man*, and *mand-en* = *the man*, whilst the latter has *omo* = *man* and *om-ul* = *the man*. The Norse *-en* is *hin*, the Rumanyo *-l-* is *ille*, each being the pronoun of the third person. Here, though the *words* differ, the *logical* elements of the combination are the same. This, in logic, is the parallel to isomorphism. It will never be true isomorphism; but always run parallel with it; *isomorphism* being inchoative, possible, or contingent *schematism.*

But in order to have either isomerism or isomorphism, full and perfect, we must take cognizance of the logical import of the fundamental, as well as of the appended or sub-inflectional, element: inasmuch as it is not only a possible, but a highly probable, phenomenon in language that the same process may give a different result. Let a word be doubled. The result will be different according as the word itself is the name of a substance or an action. I say *man man* or *beat beat* where the parts in combination are the same; or, rather, where there is only one part made two by doubling or gemination. But we can see our way to the results being different. The former may come out the equivalent to *ἄνθρωποι, i. e.* a plural number. The latter may come out an equivalent to *τέτυφα*. In each case we can see our way to the ideas associated. In the first it is that of repetition, pure and simple, which gives a plural at once. In the latter there is the notion not only of repetition, but of repetition combined with continuance, in which idea of continuance that of past time is implicit in the idea of the connection between a beginning and an end. Let this element preponderate, and we have a perfect tense, *i. e.* a tense combining a past with a present meaning. But in order for this to be possible the notion of time must be implicit in the word doubled, *i. e.* it must be a verb.

CHAPTER III.

Analytic and Synthetic View of Methods.—Origin of Derivatives and of Roots—of derived Forms, Voice, &c.

THE difference between Analysis and Synthesis, which is good in so many departments of inquiry is pre-eminently good in Comparative Philology. Each has its own proper ground; each illustrates its own definite portion of the subject; each requires appropriate aptitudes and appropriate knowledge on the part of the investigator.

Analysis, taking language as it finds it, is glad to find it in as advanced a condition as possible; every element of complexity giving it fresh details in the way of material. Its special fields are languages like the English and French with such others as approach them in character. These it traces back to the Anglo-Saxon and Latin; and, beginning at the latest, and working back to the earliest, known point, gets its results. In this all those etymologies which deal with both secondary forms and secondary meanings find their application. So does all the excellent information concerning letter-changes and the like.

Synthesis has its basis in psychology and logic, rather than in proper philology. It strives at a picture of the earliest form of the earliest language, and asks how, by addition after addition, it has become complex. It is to a great extent *à priori* in its arguments: yet not wholly so; indeed, it would be an unsafe method if it were. It owes much to the analytical method,

and is, to a great extent, dependent on it. If we wish to know what language was at first there is no better way of learning than by beginning at the end, and by eliminating such elements of which the comparatively recent origin can be shown, to come to an approximation of the simplicity of its original form. Still, the two methods begin at different ends of the subject, and require different aptitudes and different masses of information. Synthesis is deduction based on previous induction.

Respecting each, there are two facts of primary importance; which are these—each method covers a certain amount of ground, and each leaves an enormous amount of ground uncovered; neither do the two combined, when we consider the width of the field, cover much. Yet there is no third method.

The view taken in the preceding pages was synthetic, *i. e.* it began with the earliest stage of language and went on to the latest. Yet the other might just as easily have been taken, and I might, after writing on the English or the French of the present year, have asked what it was out of which they were developed, and then what it was which preceded—so going backwards instead of forwards.

A competent inquirer should be able to take either line as occasion requires; the advantages which the one has over the other, being different under different circumstances; just as it is in chemistry and elsewhere.

Let us apply this. The palmary problems in Comparative Philology are two, and two only—the mechanism of derivative forms (especially the inflections) and the origin of roots. Everything else is subordinate and auxiliary to these two main questions. Whether all the points concerning them will ever be solved is another matter. It is only certain that they give us the *summa genera* of the inquiry. What do we know about them?

How far are we on the right road for discovering them? It is enough, for the present, to state that the analytic method does the most for the one, the synthetic method the most for the other, department.

The mechanism of derivatives most especially appeals to the analytic method for elucidation. The very fact of a secondary form, or a secondary meaning, implies this.

It is consequently worked from the scholastic, rather than the logical, side; and deals most especially with languages of which we have the longest history and the most stages. Practically, it draws half its facts from the Latin and its derivatives.

Hence, the order in which the primary divisions of the facts which are now coming under notice are exhibited is the reverse of that in which they are exhibited in the general outline.

1. *Roots* are what we began with. They are what the sequel will end with.

2. Then come those modifications of the root which give such differences as those between φλεγω and φλεγεθω, *voco* and *vocito*, &c., modifications which do not affect, or only indirectly affect, the inflections. These give us what is called crude forms or themes—which may, however, as they often are, be limited to the distinct root. The so-called frequentative, inchoative, causal, diminutive, and other modifications, belong to this class.

3. Thirdly comes modification in the way of *Accidence* or *Inflection*. As the ordinary Accidents of the current grammar contain something more than true and proper inflections, this class, like the last, is not strictly defined. As the error, however, is on the side of comprehension, it is excusable. Useless as they are for investigation of the phenomena of growth and development in language, such terms as Voice, Mood, Tense, &c., are such familiar, tangible, and definite terms that, with all the exceptions which lie against them, they will determine the extent of the class: though it is clear that the *-im* in words

like *infimus*, the *-er* in words like *miserrimus*, are as little inflectional as the *-it-* in *vocito*. I admire, then, rather than imitate, the boldness of one of the ablest living philologues, Schleicher, who, in his Lithuanic grammar, has ejected them from the category in which he places the case-endings of Nouns and the persons and tenses of Verbs—recognizing comparative and superlative degrees, only so far as they agree with the positive in its signs of Case, Number, and Gender, the true accidents of nouns.

The boundary in each of these classes is uncertain. Many elements which seem to be adjuncts may really be radical. More elements, apparently radical, will really, when more carefully studied, prove adjuncts. The class of Diminutives more especially simulate radical forms; but the refined investigations of Key and others have put many of them in their true light. The question most especially connected with this class of words is the formation of Decomposites, or words containing more superadded elements than one. Are these elements ever added at once? In the *earlier* stages of languages, though the matter is difficult to prove, *No.* In the *later* stages the compound affixes are common, witness the number of words which, in the present English, end in *-ally*, where the adjective ends in *-ic.* Many a man has said *characteristically* without having recognized such a form as *characteristical.*

Of inflections, the separable ones are the simplest. In many words, however, as in *domin-æ*, a single sound expresses case, number, and gender at once.

To begin with the simpler forms. In the Greek perfects the reduplication gives us a part of the original as a prefix. Here we have a secondary element without a second word to evolve it from. The same is the case with the Malay *orang orang* = *men.*

Again, *tip* differs from *top*, without any second word to give the difference.

That these exceptions are not universally allowed is

probable. Whether any one hold that τέτυφα = τέτυφα τέτυφα (a true reduplication in full) I cannot say. That many hold that changes like *tip* and *top* are secondary results is beyond doubt. No fact is more certain than that many additions effect a change in the contiguous syllables, and that the addition may drop off whilst the change remains. Such, indeed, is the case with our own perfects, which were once, like the Greek, reduplications with a change of vowel. The reduplication is lost; the changed vowel remains. That this explains many apparently simple changes of vowels is certain. How many it explains is another question.

Let us call this *accommodation*. It is of two kinds. Sometimes the vowel of the theme is accommodated to the vowel of the addition. Sometimes the vowel of the addition is accommodated to the vowel of the theme. Again, the addition may be either a prefix or an affix; so that the change may be effected from the beginning and proceed forwards, or from the end and proceed backwards.

Sometimes the vowel may be wholly elided; in which case there is the actual dislocation of the syllables.

Again, the consonant may be changed, as it is in the Keltic and other inflections.

All these processes are factors in numerous important changes of words; and, as a general rule, each is more especially affected by some languages than by others. But they are only factors—not principles.

Subject to exceptions of the kind indicated, I believe that it is now the current doctrine that all modifications in the form of words are the result of secondary changes, and that derivation is only composition in disguise. If so, the disguise must be taken away.

I begin with the verbs.

In many of these the agglutination is simply a matter of history. In combinations like the English

can't, and the Scotch *canna*, the negative has lost its original form.

In the Italian *parlero* = *I shall speak*, the analysis is *parlare* + *ho* = *I have to speak*.

Even in a language in the stage of the Sanskrit the future is the verb *plus* the auxiliary *am*.

1. Srashṭ-*ásmi*,	1. Srashṭ-*ásmas*.
2. Srashṭ-*ási*.	2. Srashṭ-*ástha*.

Equivalent to the Latin

1. Creabo.	1. Creabimus.
2. Creabis.	2. Creabitis.

In the Greek passives, *i. e.* the true ones for the Aorist (all the rest being middles with a passive power), the addition is that of the same auxiliar; the power of the original word being participial.

In *catch'em* and *thank'ee* the name of the object is incorporated with that of the action by which it is affected; these expressions though vulgar being real, and the independent existence of the pronominal elements being concealed by the fact of their amalgamation. Grammarians, it must be allowed, have not admitted these forms into their grammars; but that is merely because their grammars only partially represent the language. In the Italian, similar amalgamations are recognized—indeed greater and more complex ones—such as *darmilo* = *give it me*, where the object conveyed as well as the object to which it is made over is named. In many rude languages these facts are noted; and, when this is done, pass for peculiarities. They merely show that the principles of language are general; the practice of grammarians partial, irregular, and inconsistent.

The formation of much which is called voice is equally agglutinate; so much so that it can scarcely be called an inflection.

The combination of a term denoting an action with

a term denoting the object which that action effects is sufficiently common; though its great prevalence in certain rude languages has been treated as if it were a comparative rarity elsewhere. The ordinary reflective construction, however, supplies its elements—which in the French places the pronoun before, in the Italian after, the verb.

Let us apply this to voice. When two out of the three reflective pronouns, thus brought into contact with the governing verb, have not only been superseded by the third, but have become so far incorporated with the word expressive of the action as to have lost their independent form, the result is a middle voice.

A man who *beats* or *washes* himself is *beaten* or *washed*, and, on the strength of this fact, middles become passives. The palmary illustrations of this, as may be anticipated, are to be found in the Norse languages. Here *sik = se = self*, in its original the equivalent of *him*self, *her*self, or *them*selves. From an extension to *one's-self* it proceeds to represent *myself*, *thyself*, *ourselves*, and *yourselves*, just like ἑ and even ἑαυτον in Greek. This gives, in the oldest Norwegian of *Norway*, from *kalla = call*, *kalla-se = call one's-self*, *myself*, *thyself*, &c.; wherein the change is limited to the elimination of the *i*. In the *Icelandic* of the same period the form is generally (though not always) *-st*: the sense being more middle than passive: thus, whilst *hann var nafnadr* means *he was called*, *hann nefdist* means *he gave as his name*, or *called himself*.

In modern Swedish and Danish the *t* is lost; and words like *kallas* in the one language, and *kalles* in the other, are treated as simple passives, just like *vocor*, or *amor*.

The languages just referred to give some interesting examples of the reciprocal, or doubly-reflective, power of

these forms in *-st*, such as *œttust* = *fight one another*, *drepiz* = *kill one another*, and which, in a later stage, give us such words as *vi slås*, *vi brottas*, *vi mödes*, *vi skilles*, &c. = *we fight*, *we wrestle*, *we meet*, *we part*, &c., isomeric, and, indeed (with the difference of arrangement), isomorphic with the French *se battre*, *se quereller*, &c. This gives us certain, perhaps all, deponents.

The nearest known approximation to a true series of *passive*, rather than middle, verbs is that given by the Aorist Passive in Greek, where ε-τυφ-θ-ην, ε-τυφ-θ-ης, ε-τυφ-θη, τυφ-θ ητι, τυφ-θ-ειην, τυφ-θ-ω, and τυφ-θ-ηναι, shew a verb *plus* the participle of the substantive verb, *i. e.* the addition of ην, ης, ητι, ειην, ω, and ειναι.

Concerning passives not accounted for by either of the preceding two methods I have nothing definite to suggest.

The general nature, however, of the participle, along with that of the infinitive (the two forms wherein the verb passes into the noun or *vice versâ*), demands notice, since it breaks down the distinction between the noun and the verb.

Infinitives are verbs in respect to what they mean, but Substantives in every other respect. They are names of actions with abstraction of the agent. In this respect they comport them like words like *redness*. They are names, though not concrete ones; being the names of substances with single attributes. All we know of a runner, when we know not whether it be a *man* or a *horse*, or what it is, is, that it *runs;* and all that we know of *running* is, that it is the act of a runner. This act may take place in past, present, or future time; so that Infinitives are susceptible of what is called Tense. It may also be an act on the part of one who is more noted for what is done to him than what he does; so that voice is one of these accidents.

These actions may be either singular or plural, or even dual; *two acts of running*, or *a hundred acts of running*, being just as intelligible as one; besides which, they may have the same relations in the way of space that a *town* or a *house* may have, *i. e.* we may go *towards* such or such an action or come *from* it.

In one sense the Infinitive is susceptible of Gender, though not in the way that a Participle is so. The gender of a Participle is that of the agent. This for an Infinitive is as impossible as it is for an ordinary verb; inasmuch as such gender as full verbs are supposed, in some cases, to possess, is only the gender of their participle. But the kind of gender which makes *gladius* masculine and *hasta* feminine may make the same distinction between two kinds of actions. The Greek Infinitives are all neuter; but, *logically*, they might just as well be masculine or feminine, as may be seen from the way in which they are translated into Latin. Though το μισειν = odi*um*, το φθονειν = invidi*a*.

Of person, however, *ex vi termini*, they are essentially destitute; person being the character of the agent from which they are abstracted, or changing the expression, which is abstracted from them.

All this is made plain by reference to those languages which contain true verbal abstracts, one of them being our own. *Cleansing*, from the Anglo-Saxon *cleansung*, is simply a substantive of the feminine gender.

Whether we can think the import of words like βαπτισθηναι, βεβαπτισθαι, &c., exactly as it was thought by an ancient Greek, is uncertain; and it is even more uncertain, from the fact of his having no experience of such recent forms as our own, whether an ancient Greek could think the import of such a phrase as *to have been dipped* exactly like an Englishman. It is only certain that both expressions are substantially one; and we can talk of wishing *to have been dipped*, just as we can of wishing *for a dipping*.

It is not by accident that Gender and Number, though possible inflections of an Infinitive Verb, are either rare or non-existent.

For *gender* the great determinant, viz. the difference of real or supposed sex on the part of the agent is wholly wanting; all that remains being the hypothetical or conventional gender of the action.

In respect to *number*, we must remember that even in words like *redness* plurality is an exceptional phenomenon. Abstracts are essentially one and indivisible; so that such plurals as we have, are, in the *very* strictest sense of the word, no abstracts at all. We can only talk of *rednesses* when we mean either two different shades of *red*, in which we really have two abstracts so much alike as not to be distinguished, or the *reds* of two different concrete substances, in which we have an abstract with a substance in the background.

In respect to what they mean, participles, like infinitives, are verbs; except that, instead of being actual names of actions, they are words which suggest an action and denote an agent; whereas infinitives, whilst they only suggest the agent, denote the action. Hence, the participle has voice and tense to about the same extent as the Infinitive; but case, number, and gender to a much greater. In all these it follows the substantive, towards which it comports itself like an ordinary adjective. As to *Mood*, the Infinitive *is* one; the Participle being without it—or rather, being, in some sense, a mood itself.

Have participles *Persons?* I know of no language wherein the participle, preceded by a pronoun of the first person, has a different form from a participle preceded by a pronoun of the second, or a participle attended by a pronoun of the second person from a participle attended by one of the third. At the same time there is no logical reason against such a concord. From this point of view, participles converted into tenses, by losing their auxiliaries, cease to be participles.

The participle of the middle voice seems to have arisen late, and to have been lost early; such being the inference from the Greek τυπτομενος and the Latin *regimini*, *amamini*, &c.; these last, though nominally persons plural being really for the second person plural just what τετυμμενοι (εισι) is for certain third persons in Greek. In Latin, however, they have lost their auxiliary, and exist only as fragments of a participial inflection—fragments unless we prefer to consider them as rudiments.

In these, as well as in τυπτομενοι, with which they are isomorphic, the sign of the participle (ν) follows the sign of the voice (μ); so that τύπτομενος is newer than τύπτομαι.

Passives like τυφθεις are merely participles upon a participle, just like *having been* in English. Whether τυφθεις or ἐτυφθην be the older form, is not the present question. It is certain that τυφ-θ- is the basis of both.

In the Middle voice, then, the participle is later than the tenses and the persons, whilst in the Passive it precedes them. Indeed, it is (as has been stated) the only element which is truly and primarily passive. As for the ν in τυπτομενος it is *active*, being part of a word denoting an action, in which the complementary noun is both the name of the agent and the person suggested as the object. I am not aware of any successful or even plausible attempt at isolating any participial element and even guessing at what it was as an independent word.

The contrast between the τ in τυφθεις and the *n* in *stricken* is remarkable. In languages like our own, where the Passive Participles stand either alone or without any such agglutinate passives, as ἐτυφθην, &c. in paradigm with them, there is the perplexing fact of such connections as they have at all, being *Active*. Form for form *swum* and *burnt*, the *passive* participles are identical with *swum* and *burnt*, the *active* preterites. In an earlier stage of our language there was a differ-

ence, and whilst the participles were *swummen* and *bœrned*, the preterites were *swummon*, *swumme* or *swam*, and *bœrnde*. Even this, however, is but a slight distinction.

Participles by losing their auxiliars simulate tenses—often tenses with gender. But, then, as before stated, they are something more than participles.

Now comes a short notice of the *Persons*. Many grammarians have suggested that the signs of the persons in the verb might be neither more nor less than the personal pronouns appended, in the first instance, to the verb, but, afterwards, amalgamated or incorporated with it. Mr. Garnett, however, observed that the appended pronoun was not so much the *personal* as the *possessive* one: that the analysis of a word like *inqua-m* was not so much, *say* + *I*, as *saying* + *my*; in short, that the verb was a noun, and the pronoun either an adjective (like *meus*) or an oblique case (like *mei*), agreeing with, or governed by, it.

It is certainly so in some cases. The Magyars, instead of saying *my apple*, *thy apple*, say what is equivalent to *apple-m*, *apple-th*, &c.; *i. e.* they append the possessive pronoun to the substantive, and, by modifying its form, partially incorporate or amalgamate it. They do more than this. They do precisely the same with the verbs in their *personal*, as they do with the nouns in their *possessive*, relations. Hence, *olvas-om*, &c., is less *I read* than *my reading*; less *read* + *I*, than *reading* + *my*.

(1.)

Olvas—om	= *I read*	= *reading-my.*
—— od	= *thou readest*	= *reading-thy.*
—— uk	= *we read*	= *reading-our.*
—— atok	= *ye read*	= *reading-your.*

(2.)

Almá—m	= *my apple*	= *apple-my.*
—— d	= *thy apple*	= *apple-thy.*
—— nk	= *our apple*	= *apple-our.*
—— tok	= *your apple*	= *apple-your.*

From the verb, I pass to the *Article*. If we look to the derivation of the word *article = joint*, it suggests nothing more than one word so united, or articulated, with another as to have lost its own separate existence. Such is the case with *a* which is *an*, *an* being *ane* or *one*. Without a substantive it is nothing: though *one* is a separate and separable word. The same is the case with *the*, which is a derivative of the root of *this* and *that*. Yet it only exists as a prefix: however much its congeners may exist as separate terms. Some years back I found *no* added to the list of English articles, and, at once, admitted that it was one. I have since added *every*. None of these words can exist without a substantive of which they are a concomitant part—separable, inasmuch as the substantive can exist without them; separable, inasmuch as they are full words in the matter of pronounceability; but inseparable, inasmuch as when away from their noun, they are only words *in posse*.

All these words are pronominal in origin, and they are all recognized articles. They form a natural class, inasmuch as they are the terms which play an important part in Logic. They convey the notions of quantity or its absence, of definitude or its opposite. They are a natural class: but it does not follow from this that they constitute the whole of the group to which the term article may apply. Nothing in the etymology of the names conveys this. All that the etymology requires is their non-independent character. It does not even limit them to nouns, still less to pronouns. When the so-called possessive pronouns, instead of constituting a whole term (as in *mine is here, this is mine*), form only a part of one, they change their form, and are just as articular in their construction as *the, a, no*, and *every*. We say *my, thy, our, your, their*, or *her—horse*, but no one says *this horse is my*, or *this hat is thy*. When the article becomes post-positive it becomes a recognized inflection; pre-eminently agglutinate in its origin.

Certain participles simulate (we may say become) tenses. Cases may simulate (or become) adjectives. *Cujum* is a neuter of *cujus*, word for word, *κοῖον*; which in Greek is treated as an actual adjective. Let a case denote a *quality* (and, in the Fin, cases do so) and it may take the gender of its substantive; in other words, agree with, instead of being governed by, it. Which is the case is a mere point of grammatical phraseology. Wallis calls *man's* in a *man's hat* an adjective. It is, and it is not.

The above shows that parts of speech grow out of parts of speech, and accidents out of accidents; yet little or nothing has been done towards even getting to the fundamental inflection.

This alone implies a great deal of work as a mere preliminary to the origin of the primary agglutination.

That all the preceding examples of inflection reduced to agglutination are in reality no cases of inflection is an objection easily made; and it is one which the author admits. When all inflections have been analyzed and reduced, our phraseology may require alteration. The present notices are based on the current language of grammarians as it is found. How far a higher philology than the present will recognize the present grammatical nomenclature, no man can tell. For two sets, however, of languages,—for languages in the most advanced, and languages in the most rudimentary, stage—they are, for the most part, useless or something worse.

Number in some cases arose out of reduplication.

The following from a rude African language, the Tumali, is a suggestive instance of another origin :—

Ngi = *I.*	Ngi-n-de = *we.*
Ngo = *thou.*	Ngo-n-da = *ye.*
Ngu = *he.*	Nge-n-da = *they.*

Da = *with.*

Me-cum = *me.*

The *da* (or *de*) in the second column, is the sign of

the plural number. It is also the preposition *with*. Now *with* denotes *association*, association *plurality*. Hence

Ngi-n-de = *I* +,= *we.*
Ngo-n-da = *thou* +, = *ye.*
Nge-n-da = *he* +, = *they.*

This is just as if the Latins, instead of *nos* and *vos*, said *me-cum* and *te-cum*.

Such are some selected instances out of those recognized inflections which can be traced back to agglutination. Strictly speaking, indeed, they are not so much inflections as agglutinate forms in a language otherwise inflectional.

CHAPTER IV.

Roots.—Attributes and Substances.

HERE we begin with the difference between the Attribute and the Substance.

A yellowish, round, sapid, fragrant object, in a certain place, of a certain size, and one in number, provided it have other characters as well, is an orange. Its colour, its roundness, its sapidity, its fragrance, its place, its size, and the fact of its being of a certain number, are so many attributes. The complex of these gives us a substance; such as the orange under notice, and many millions of other objects besides are known to be. Let us, however, strip it of its attributes one by one, without replacing them by fresh ones. If we begin with its place, the matter is easy. It is abolished at once. It is not in its old, and, by our hypothesis, we find it no new, one. It is nowhere, *i. e.* non-existent. Let this, however, pass. When one after one all the attributes, even to the very last, have disappeared, what remains? This is easier asked than answered. All we need know at present is, that attributes are single, and that (with one exception, which has no bearing upon our present inquiries) substances are complex. These last are the result of a certain number of attributes combined. I do not say that by dint of profound thought in the higher regions of metaphysics this complex character on the part of substances may not be done away with, and that with all their multiplicity of attributes they may not be reduced to unity. They may be looked upon as forms,

ideas, or archetypes; or they may be looked upon as bonds of union, or *nexus* (*nexusses*), by which the attributes are held together. For inquiries, however, like the present, a substance which is other than a complex of attributes is impossible. So much follows from the distinction that the reader's attention is especially directed to it.

More important than the fact that metaphysicians can give unity to a substance is the fact that the language itself does so. It names many of them as if they were the simplest of the simple. *Orange* is as simple a name as *fragrant*, and it is older than *orange-coloured*. A pebble is hard, round, smooth, and heavy, yet no one knowingly calls it *the hard, the smooth, the heavy*, or *the round*. Still less do they call it by a name which implies hardness, smoothness, heaviness, and roundness all at once. Yet, without more than one of some such attributes it is no pebble; and without more than one of some attributes or other no substance is what it is. They are all complex: yet most of them are named as if they were simple. I leave this for the present, and, for the sake of impressing the fact on the attention of the reader, I call it a philological paradox; of course, in preparation for an attempt at an explanation.

Attributes fall into two primary divisions; (1.) Attributes of Quality, (2.) Attributes of Relation. Attributes of Quality tell us what an object is in itself, and without relation to other objects around it; and are characterized by being fixed, permanent, or invariable in meaning, and inconvertible in respect to their application. *Red* and *white* apply to colour: *sweet* and *bitter* to tastes, and what they mean in the mouth of one speaker they mean in the mouth of all others also. Contrast with these such words as *I* and *thou*. The first means the speaker, whoever he may be; the second the person spoken to; and if ten different persons address ten different persons in succession, each word

means ten different individuals. The same with *this* and *that*. Talk of two balls at different distances, and change their relative places, and *this* becomes *that*, and *vice versâ*. In short, attributes of relations give convertible terms, terms of which the import is only temporary; and which may mean *men*, *horses*, *stones*, and what not, *ad infinitum*, and in succession.

Another difference between attributes of Quality and Attributes of Relation is that, while the former can form, by themselves, only the predicates of propositions, the latter can form both subjects and predicates. Thus we can say—

The fire is hot.

but not

Hot is fire.

If we do, we either use *hot* for *heat*, or *hot thing*, or else transpose the order of the terms. Meanwhile we *can* say—

This is fire.
These are hot.

This is in favour of the division being natural. Indeed, it is not only natural, but generally acknowledged.

As to the grounds of this difference of power as measured by the part which the two classes of words play in propositions, they are sufficiently patent. *Hot* means nothing, except so far as it applies to some object endowed with heat; and what this object is no one knows without being told. With words like *this* and *that* it is different. They are never used except when the object to which they apply, either from having been mentioned before, or from being within sight (perhaps within touch), is already known. For this they are, simply, not a qualifying word, but another name—temporary and ephemeral indeed, and, except so far as they are interpreted *aliunde*, obscure, but still neither more nor less than a second name. If John Smith says "*I*,"

he knows well enough who he means, and so does the man whom he addressed as *you*.

Words like *red* and *bitter* are no true names, but only words suggestive of names. Words like *I* and *this* are, if not true names, their equivalents in everything but steadiness of application. In grammar they comport themselves as names.

Attributes of Quality fall into two divisions, which, though they graduate into one another on their confines, are sufficiently distinct when we take extreme, or even medium, instances. In the one, the words express conditions rather than actions, in the other actions, rather than conditions. *The sun is round* gives us an instance of the first; *the sun is scorching* of the second. Between, however, *the sun is shining* and *the sun is bright* the difference is comparatively slight.

Attributes of Relation do the same. *I, thou, he, this, that,* convey Relation in the limited sense of the term. *One, two, three,* and the other numerals convey the attribute of Quotiety, or Howmanyness.

Quantity, as applied to mass, comes between the two primary classes. To the question, What is the size of Lake Superior? we may answer, either as large as Yorkshire, or so many square miles; according as we betake ourselves to mass or numbers.

It is because terms like *this*, &c., are terms of Relation, Relations being changeable, that they are convertible; and it is because they are explained by something within either the context or the actual range of the speakers' senses that they can be used by themselves. The two properties are connected, and their connection makes the division natural. This, however, is not all. Words like *me, thou, this* and *that* must be among the oldest of the languages. More than this. They are words that play an important part in the secondary formations—constituting, as we have seen,

articles, and the personal affixes of verbs, to a certainty —and, probably, much more.

A rose, besides being fragrant, and endowed with a certain form, is *red*, in other words, besides possessing certain other qualities, it has that of *redness*. The idea of *redness* by itself, I get by neglecting the other qualities and contemplating that of redness only. I may also get it by drawing off and throwing aside all the other qualities until redness alone is left, which I take as a residuum. In either case I get *redness*. If I do this without connecting it with any other substance, such as a boiled lobster or a soldier's coat, I get redness *per se*. In the first case, I get it as an abstract proper, by having selected it from so many other qualities, and *drawn it off*. Here it is an abstract properly so called; inasmuch as the process that gave it was one which made it an *abstractum*—*i. e.* a thing drawn off. In the other, as far as the result obtained is the test, it is just the same: only the name *abstract* is less proper. The result is a *relict*, or thing left, rather than an abstract proper. The result is the same (redness *per se*, or redness without any particular thing to which it belongs); but the process in the first instance is one of selection; in the second one of exhaustion. If the logicians, who have most to do with the distinction, find it necessary, they will distinguish between the two when the distinction is needed. Meanwhile, let it be neglected.

Abstracts of the kind in question are common, and very intelligible. We know how to make them. We do it in English by adding *-th*, or *-ness*, as in *length* and *happiness*. The basis is an adjective; and there is no doubt as to what an adjective is. The only question is whether an abstract term is the name of a substance or an attribute. It is the name of an attribute and it is not. It is the name of an attribute, inasmuch as it is

a name which arises out of *red*, which is undoubtedly attributive: and it is *not* the name of any red object, inasmuch as it is an abstract solely and wholly on the ground of its being separated from any object and from all. It is also the name of a substance, and it is not. If qualities be substances, the name of a quality is the name of a substance also. In fact it is substantive without being concrete: and herein lies its peculiarity. As a general rule, substances are substances because they give a concretion of attributes. An abstract, however, must be looked upon as a substance with a single attribute. These may exist, like as corporations sole, or corporations consisting of a single individual, may exist. In this view I differ from so high an authority as Mr. Mill, who states that abstracts are the names of attributes. Is he prepared to deny that a name is a substance? I admit that the vast extent to which concretes and substances coincide (a fact upon which no one builds more than myself) makes substances with single attributes no better than concretes—concretes which have no greater content and extent than an abstraction—and that it reduces the doctrine just propounded to a very near approximation to a philological fiction; and I also admit that for the question which Mr. Mill has to deal with, his own definition may, possibly, be the right one. I insist, however, that in philology substances with single attributes must be recognized. In the way of declension *length* and *redness*, with their genitive cases and plural numbers, are substantives, if not substantial.

I urge, then, the doctrine for philology only: and even here I admit that, when we talk of *length* and *redness* in the plural number, the pure abstract idea is relinquished, and that we mean sorts, kinds, or varieties of redness, rather than the indefinite unity suggested by the pure abstract itself. Substances, then, with single attributes, are admitted laxly, exceptionally, and

as philological fictions. They are admitted laxly, because in some of the substantival forms the strict abstract meaning is departed from; exceptionally, because there are not many of them; by a philological fiction and partially, because it may be that it is only in philology that their recognition is required.

Perhaps, considering the fact that it is only in their being attributes and units that the rudimentary words of which the origin has just been investigated, agree with the true abstracts of the logician, too much has been written upon them. Still, the extent to which extremes meet may have been worth the time spent upon its elucidation. More than this. The opposite to the abstract of the logician is *concrete;* and, though the former term is a word which is of no great use in the infancy of a language, the latter is a very convenient one. Having no ambition to introduce new words before the things to which they are applied are familiar, I have kept the one where it is not wanted for the sake of its fellow which is. I may add that, according to a doctrine exhibited by myself elsewhere, *concrete* is, in respect to its probable etymology, a term of doubtful propriety for its new use. I have, elsewhere, derived it from *cerno*, and connected it with *discrete*. The present use, however, goes upon the common notion that it comes from *cresco*, and means *grown together*. Hence, I use it because it is convenient, rather than because it is unexceptionable.

Again—I shall use it in a wider sense than it has hitherto been used in.

In logic, the term *red* in *red*ness is the name of an attribute taken by itself, *i. e.* as (as has been stated) a term in the abstract—*red* in the *abstract*.

The same word as applied to one of the numerous attributes of which the complexus give us the substantive name *rose*, or *blood*, is *red* in the *concrete*.

In the eighteeenth century we take a substance and by analysis, decomposition, or disintegration of its concretions, pick out the abstract.

For (say) the year 1 of human speech, we attempt to reverse the process, and beginning with a single attribute, by a process of synthesis or construction, consider the conditions under which it can be made to form a concretion which shall constitute a substance. The simple reversal of the process tells us what to do. We have to add to it just so many other attributes as, in a later stage of language, we took away. The orange which we made into no orange by subtraction, we make into an orange by adding, to any one of its attributes, the remainder or complement. Doing this, we get a long compound; as long, perhaps, as the long word in Aristophanes. Or, I should rather say, that we should get this if we wasted our time on the process: for a waste of time it most certainly would be. Substances, in the way of name, were not built up by a mere reversal of the process by which they can be pulled down. How were they? Was there a system of short-hand, by which every name of an attribute had its most essential element taken out and combined with a similar element from the attributes of the complement? There might have been this in Laputa amongst a body of philosophers. Was there a long series of names in the mind of the first speakers which were given to the objects around them as occasion demanded? Upon sufficient testimony we might believe this; but it is scarcely the doctrine at which we arrive by inference. Were names given, as a man might put a mark on a door, either drawing a figure haphazard, or after mature deliberation as to which was the best suited for the purpose? Upon sufficient testimony, we might believe this, as we believe upon sufficient testimony even the most incredible statements (if we do not believe them the testimony is insufficient); but we shall not get at it by inference. We may safely pretermit all such supposi-

tions as these: adding, with unfeigned reverence, that until inference has been exhausted we should not have recourse to intervention from above; or rather we should say that if this cutting of the knot be our first step, scientific inquiry is out of place, and the problem is either no problem at all, or an historical, rather than an inferential one.

Attributes are essentially simple, and the names of, at least, the primary attributes are simple also. Substances are essentially complex; yet the names of them are fully as simple as, and, in some cases, simpler than those of the attributes. Both classes, as far as the names go, equally give us the names of unities.

I submit, then, that in the name of a substance, the donotation of its complex of attributes cannot, at one and the same time, be simple and significant; meaning by *significant*, being in the category of those names of attributes which will soon come under notice, *i. e.* capable of being reduced to some intelligible connection between the speaker and the environment.

If *redness*, which is a substantive, be a name, *red*, which is an adjective, is not one. It suggests *redness*. It applies to a *red object*. But it is something different from each. Like all adjectives (and every adjective has either its real or its possible abstract) it is a word which suggests a name, but which is, itself, no name. Mr. Mill, with whom I again unwillingly differ, treats it as a name. But, surely, *name* is a correlative word, and wherever there is one, there is a thing named. But there is no such thing as *a red*; or, if there be one, the fact of its existence makes *red* a substantive. I write, however, again as a philologue. The question is one as to the definition of the word *name*, and there is no necessity for its being the same in philology and logic.

In philology we must understand most distinctly that adjectives are words suggestive of names rather than names themselves, and that abstracts are the names of

substantives with a single attribute—if necessary we may (fictionally and exceptionally) call them concretes without concretion.

Whatever they are, they are mentioned at the present time, not because they are made much of, but because they are neglected, or even ignored. They are noted as exceptions, to be got rid of for the sake of clearing the ground. They belong to the later stages of language, and what is now under notice are the earlier ones. They are all derivatives; and what we are now considering is roots.

You may get an actual building-stone by picking one out of a ready-made castle: but you may also get a building stone *in posse* from the first quarry you meet with. With this, as an illustration for the difference between what may be got in the way of a simple element from a thing constructed and a thing in the process of construction, let us turn to the opposite end of our inquiry, and ask how far an abstract can be got from a language under a course of formation.

As far as it is *attributive* it can certainly be obtained. Whether it can be got as the *name of an attribute* is another question. The date of our inquiry is, perhaps, too early for names. A child burnt by putting his hands too near a stove in a dark room, or dazzled by opening his awakening eyes to the burning sun, has certain sensations, and these sensations are referable to the *attributes* of heat and light. He has an impression. His expression in the lowest form is a scream or a whimper. If it go further, and an attempt be made to communicate his feelings to a second person, a name is approached. Never mind how imperfectly; it is the attribute which has suggested it—the attribute by which the feeling was created. Of the other attributes connected with the cause he takes no cognizance: so that the cause, though his elders know it to be substantial, is simply attributive. In other words, his intellect

has taken cognizance of nothing, and all that his senses have perceived is an attribute. As he grows older he knows that suns and fires do something else besides burning and dazzling, and that other objects, besides fires and suns, dazzle and burn. Hence, he separates them, and understands why they have different names accordingly. This, however, is knowing them as substances. So long as he knows nothing of them but their respective heats and lights he knows nothing but attributes.

Say that this attribute has a name—is that name an abstraction? It is, and it is not! Etymologically, it is not. Though pure and simple, it is got out of no analysis, decomposition, or disintegration. It is got neither by selection nor exhaustion. It belongs to the rudiments instead of the climax of language; to the infancy rather than the manhood of the mind; to the senses rather than the intellect. It can only be called an abstraction, for want of a better name, and a better name will, doubtless, be got for it when needed. Nevertheless, it is attributive, and it is a unity; and in this way the extremes meet.

The notions of any one who writes upon cases like this must, perforce, be obscure and vague. The simple fact of his being able to write at all removes him from that state of mind in which alone they approach distinctness. And in this state of mind no cognizance can be taken of them. Savages, children, and the men and women who lived when language was in its embryo, alone felt them; though, feeling them, they could not think upon them. Hard as it is for a Papuan to compass a modern abstraction, it is nearly as hard for a German or an Englishman to understand these rudimentary abstracts of our nonage. What we know about them belongs to that inferential kind of knowledge which we have in all purely psychological inquiries; inquiries in which the subject examined is itself the conductor of the exa-

mination. Nay, it is harder. It should be compared with the investigator scrutinizing himself as a child.

Three facts, however, concerning what we may call these representative abstractions, with all our ignorance, we *do* know.

1st.—That they are simple.

2nd.—That they strike the senses and excite the emotions rather than the intellect.

3rd.—That between impressions on the senses, and the external expression of them, there is always a conceivable, and often an intelligible, relation.

And these facts are of paramount importance.

Of the first two propositions no further notice will be taken at present. Upon the third there is something to be said. Between simple sensations and the emotions in their extreme form there is a broad difference: little, however, on the confines of the two. We must prepare, then, for transitional phenomena, a debateable land, and a doubtful boundary. I shall put down to the account of simple sense all cases where the feeling is one of neither pleasure nor pain, neither satisfaction nor dissatisfaction. Where there is an element of the latter it will give an emotion: and anything that implies a wish (either directly or indirectly conveyed) for change will pass as emotional. This will be carried so far that a man's pointing-out to something (whether he want it or not) providing he does so with an indistinct feeling that he is trying to make himself understood, will be considered as a man desiring something—*i. e.* as a man unsatisfied in some point.

The very simplest, even the non-articulate utterances in this way have characteristics enough to make them the representatives of a class: for groans and screams agree in being independent of imitation and independent of memory. A certain stimulus provokes a certain sound, even when that sound has not been uttered before; or,

if uttered, forgotten. That the emotions give us those inarticulate sounds which are imperfect imitations of articulate ones is clear. They also give us our interjections. But this is little. I claim for them, however, another class of words which is an important one. I submit that when we point out anything with (say) the finger, and at the same time utter a word, the word so uttered is the result of a definite consensus between the tongue and the hand. I can not only easily conceive that, when the hand goes forward, the tongue does the same, but I am sure, from examinations in the field of actual language, that such is sometimes the case.

We now go to the next class: and begin with purely imitative sounds. As long as these are inarticulate they are unimportant. They grow into importance when they become articulate and representative, or (as, availing myself of the difference of language which gives us the distinction between a *botanist* and a *florist*, I shall call them) *mimetic*. *Hum*, *buzz*, *whizz*, *fizz* are the types of this class; some of them, as *mew* for the noise of a cat, *tictac* for that of a watch, being nearly imitative. Herein the word is a sound addressed to the organ of hearing, and is the result of an impression made on the same organ; the expression and impression being homogeneous. But what if they be heterogeneous?

There is a well-known statement, which has done some service in its time, that Cheselden couched a man for a cataract, who on seeing a piece of scarlet cloth said it was like the sound of a trumpet. Whether he really said what he thought, whether Cheselden said that he said so, whether the fact were true, are matters of indifference. All that is needed is the fact that every one who meets with the anecdote sees (to use a common expression) that there is something in it. We can understand the man thinking so. We can fancy that we might ourselves, in the same situation, have said the same, and that we should *not* have said so of a puce-

coloured piece of silk; any more than we should have compared the blind man's piece of scarlet to the murmur of a rivulet. One, to be sure, was a colour and the other a sound. For all that there was an analogy.

Now, if this fact were the only one of the kind under notice, it would explain something; however little. It would tell us how the man who had developed a word for the sound of a trumpet upon the principle that he had called the sound from a bee-hive a *hum* would, *mutatis mutandis*, use an equivalent expression upon seeing something very bright and very red.

That biologists can carry this train of reasoning further than it has been dreamt of being carried I believe, and with them I leave the question—to return to a distinction between attributes of quality and attributes of relation, which is one of primary importance. Attributes of quality, the moment they take part in the formation of a substance, however simple that substance may be, are always more than one in number; whereas attributes of relation, however complex, heterogeneous, and numerous may be the elements of which the substance which they help to build-up consists, are, in number, one, and no more than one. A *stone* considered as a *stone* has weight, or some other quality, *plus* something else. A *stone* considered as *this* or *that* has nothing but its *thisness* or *thatness*.

Yet *this* and *that* are its names. They may be its names for a moment only, disappearing or changing when the relations of the stone to the speaker are altered; but, for the time, they are names; temporary names, convertible names, variable names, non-essential names, equivocal names if we like to call them so—but still names. All relations, however, end (or begin) with the speaker: so that in relational names there is what we may call an *egoist* element; *i. e.* every relational name has either a direct or an indirect connection with the person who uses it. With *I*, or *me*, this is plain;

and with *thou*, and *he*, it is equally so. They are in the relation of the object spoken to, or spoken of. *This*, is nearer ; *that*, further from the speaker. Even words like *same* and *other*, gravitate, so to say, to him : though the connection is indirect. They denote something that is related to him by its relation to some third object, of which he has already measured the relation borne by it to himself. If so, every word has two names, one taken from the complex of its qualities, another taken from its relations for the time being ; one permanent, one mutable. And such is the fact, of which grammar has taken cognizance : inasmuch as the relational names give the important, though small, class of Pronouns ; the names based on the complex of the permanent attributes the larger, but not more important, class of Substantives.

From this it follows that all the difficulties alluded to above, the difficulties connected with the conflict between the simplicity of name and the complexity of attribute, in the case of substantives, vanish when we come to the pronouns ; so that if they were the only ones, the philology of the pronouns would be easy.

Can substantives grow out of pronouns ? Can the mystery connected with the antagonism between the complexity of substances and the oneness of attributes be explained by any of the attributes of relation ? Definite and patent facts, sufficiently certain to be taken as a basis for further trains of reasoning upon this point, have yet to be found.

Can the converse take place ? Can pronouns grow out of substantives ? or, changing the form of the question, can substantive names, with all their complexity, become simply attributive, their attribute being that of relation ? To this the history of the numerals says Yes—the difference between the cardinals and the ordinals being the point which most demands attention. The cardinals as compared with the ordinals are certainly abstract, and, as such, ought, at the first view, to be

the newer terms. They ought also to be derivative. Yet the converse is the case. The concrete ordinals are derivative, the abstract cardinals simple. To understand this let us notice a distinction.

Objects which are designated as *this*, *that*, *yon*, are also objects which can be designated as *first*, *second*, *third*. Of a series of objects submitted to the process of numeration the *first* = *this*. The *second* is another *this*. The first, however, has ceased to be *this*, and is what it is through its relation to the second. In this way each object is *this* for the time being. With *third* the ideas of relation get complicated, there being first the relation of *third* to *second*, and next that of *second* to *first*. *Third*, however, is what it is from being preceded by *second*. In other words, *order* is necessary to our notions.

Let this mode of forming a series of numeration be called the *relational* method; the place of each number in the sequence, series, or system being determined by its relation to the ones by which it was preceded and followed. It is clear that such a phenomenon as the idea of a *fifth* before a *third*, a *third* before a *second*, is impossible. In this way, then, number is order, and things numbered are objects to which *ordinal* numbers are applied.

Again, except with arithmeticians and algebraists, there is no number without an object to which it applies; just as there is no *this* or *that* without an object characterized by what we call its *this*-ness or its *that*-ness. But words like *thisness* or *thatness* are abstracts which languages in their earlier stages may and do dispense with. At any rate they originate out of the concrete term, with its special, definite, and often palpable, application. Now, there or thereabouts, *ten*, *nine*, &c. are to *tenth* and *ninth* as *this*-ness and *that*-ness, or *near*-ness and *far*-ness are to *this* and *that*. Why, then, are the forms so simple?

Because they are really the older and more original words; and they are the older and more original words because the otherwise natural evolution of numbers in the way of *order*, and as concrete *ordinal* terms, is traversed by the existence of certain natural *monads*, *duads*, *triads*, *tetrads*, *pentads*, the effect of which has been to give us what may be called the *representational* method of numeration in addition to the *relational*.

The number for which we have the most natural symbol is *five*—the symbol, or natural pentad, being the *hand* (= *five fingers*). If so, the following phenomenon, impossible with the relational, is possible with the representational, method. There may have been a name for *five* before there was one for *four*, *three*, or *two*. Without asking how far this is a real fact or imaginary illustration, let us deduce from it the inference that although the representational system of counting may be more natural than the relational it is less scientific. We may also add that though it may give us numeration it gives us numeration of a very equivocal kind, *i. e.* numeration without order, and (as such) possibly no numeration at all. More *natural* than the relational method it is; inasmuch as investigation tells us that language has adopted it to the total, or nearly total, exclusion of the other. But it is natural only from what we call the accident of the existence of certain natural *monads*, *pentads*, &c.

Of all these *monads*, *duads*, *triads*, &c. (words for which we want a general term, and for which I suggest the word *tosad*) the most natural, as aforesaid, is the *hand with its five fingers*. In other words, the *pentad* is the most natural of the *tosads*; but if the number of our fingers had been variable, it might never have existed.

Next to this, perhaps, is the *duad*. In certain of the North-American tongues the names for a *pair of shoes*,

a *pair of snow skates* = *two*. In our language we have *brace*, *pair*, *couple*, synonyms for *two*; whilst, for *three*, we have only the word *leash*, for four nothing.

The *triad* is less of a natural *tosad* than the *duad*, and the *tetrad* less of one than the *triad*—the *triad* being, generally, two + one, the tetrad two + two. In other words, the natural tetrad is generally two duads.

Just as a tetrad is two duads, a decad is two pentads —but as there is such an object as *a pair of hands* = *a decad of fingers*, the decad is one of the very natural *tosads*.

An *eikosad* is also natural = the *fingers* and *toes*. Amongst the Caribs *one hand* = five, *two hands* = ten, *a hand* + *a foot* = fifteen, *a whole man* (*i. e.* two hands and two feet, or ten fingers and ten toes) = twenty.

Now it is clear that a system of numeration may consist of those numerals only for which there exist the natural *tosads* for two, five, ten, fifteen, and twenty—the others being wanting. It is equally clear that it is only in the eyes of the savage that this is a system of numeration at all. To the arithmetician it is only a series of names for a few out of many collections of units: and for the purposes of his science one which is wholly useless, being deficient in the great element of order.

The three classes of words which give the *minimum* amount of complexity and the nearest solution of our problem are (1) the verbs and adjectives, the latter being connected with the former through the participle; (2) the pronouns. Both give unities; the former the unity suggested by a single permanent quality which, when it is contemplated as an element of a substance in a given state, is adjectival, but which when contemplated as an element of a substance affecting the senses, or, in motion, is verbal; the verbal element being the primary one, *i. e.* the one which most affects the observer.. The attribute of relation gives us pronouns.

Both are unities, and, by being this, they limit the question to the simple consideration of their origin.

The substantives give the names for certain complexes of attributes, superadding to the question of origin, the second and more difficult one by which we try to reconcile the complexity of constitution with the singleness of name. In other words, they give us concretes with simple names—the main mystery in the question.

That pronouns may become substantives is possible; though unproven. That substantives become pronouns is a fact verified by the history of the numerals. Still, the evolution of substantive names out of pronominal ones would (if proven) explain but little. The only hypothesis that covers much ground is the one which holds that the name of some permanent attribute grew into a representative of the whole complex or concretion.

Being this, it would undergo changes, and that both in form and meaning.

Word for word, *eveque* and *bishop* are the same, yet they have not a single letter in common.

Idea for idea, a *deal* at cards is the same as *deal* = *plank of wood.*

Where is the connection on either side?

For the first, we have the Latin *episcopus*, or the Greek ἐπίσκοπος, with the intermediate *evesque.*

For the second *a great deal;* where *deal* = *part*, the German *theil*, the Danish *del.*

We here see then the links. The psychologists explain the *hiatus.* Concept A may agree with concept B, but B shall be linked with C, by some element not common to it and A. The same applies to sounds.

Hence, even if we knew the original phonetic expression of the primitive concepts, there are the phenomena of transition to be explained. Induction helps in both, and the further it goes the less mysterious language becomes.

In the laws which regulate these changes superadded

to the cognizance of the names of the primary attributes, the application to the relations between the organization of the speaker and its environment, and the process by which they could be extended from the representation of a unity to that of a concrete, lie the problems of the Terra Incognita—a wide one, no doubt, but not hopelessly beyond investigation.

As unities, the abstracts of the nineteenth century agree with the primitive word out of which the substantive concretes, by hypothesis, grew. These can scarcely be called abstracts. At best they are *abstracts before the concretes*, which are, etymologically, no abstracts at all. Still, they are unities ; they give the key to the origin of the chief elements in language. It is not easy to realize their import. Still, they command our attention. According to the present writer, the primary problems of language are these or none.

If, out of the two methods exhibited above, the synthetic only explain the origin of the words *hum*, *buzz*, and the name of the *cuckoo*, it does something ; and if the analytic only tell us that both *bishop* and *eveque* come from *ἐπίσκοπος*, it tells us what is worth knowing. Each covers *some* ground. It may be a small plot, a mere cabbage garden in a hemisphere. Still, some ground at each end is covered ; and the only question is, *how much ?* And common-sense tells the looker-on thus much ; viz., that it is less than the defender of his own domain claims and more than is allowed him by the claimant at his antipodes. Let the two, however, work and work until something like an approximation, by which the vast *terra incognita* which intervenes may be covered, is effected. When the limit on either side is attained we shall probably know that it *is* a limit, and *why* it is one—just as we know, not only that the circle has not been squared, but that its quadrature is impossible.

I conclude with a few remarks upon the claim of Com-

parative Philology to be called a Science. It may and it may not. At any rate it is an approximation to one. To a certain extent, however, the answer depends upon the country in which the question is put. It must do so perforce; inasmuch, as to a great extent, it is a matter of definition. In England, where we pique ourselves upon being a practical country, anything is Science which is neither Art nor Literature: and, assuredly Philology, in its higher branches, is neither the one nor the other.

As a department of human knowledge, as a province in a map, as an element in an organon, it is neither more nor less than a branch of anthopology, or the natural history of man as distinguished from the lower animals, with a special bearing on ethnology or the history of the varieties of man as a species. What this is, and how it stands in its relations to descriptive anatomy on its material, and to ontology on its spiritual extremity, psychologists are the proper persons to determine. As an art it is an adjunct to the art of learning foreign languages, living or dead; and it is unsatisfactory to think that many admirable linguists and accurate scholars know it in this aspect only. As an applied science (to use a current term) it is an instrument in what we may call prehistoric, ante-documental, or ante-monumental, history; especially in ethnology. But this does not either make or unmake it as a science.

That words apparently identical are distinct; that words without a letter in common are only one; and that they can be shown to be so by irrefragable and refutation-tight lines of argument, are facts of an undoubted scientific character. So is the fact that nothing is arbitrary or accidental. But this is not enough. Where *is* there accident? If the absence of it suffice, everything is scientific.

More relevant are the facts that depend upon the

character of mind which is required for the successful pursuit of any given study.

The study of language is one thing, that of languages, another. They are different; and the intellectual powers that they require and exercise are different also. The greatest comparative philologists have, generally, been but moderate linguists. A certain familiarity with different languages they have, of course, had; and, as compared with that of the special scholar, their range has been a wide one; but it has rarely been of that vast compass which is found in men after the fashion of Mezzofanti, &c. —men who have spoken languages by the dozen, or the score; but who have left comparative philology as little advanced as if their learning had been bounded by their own mother-tongue.

In stating this, no opinion is given as to the comparative rank or dignity of the two studies; no decision upon the nobility or ignobility of the faculties involved in the attainment of excellence in either. The illustration of a difference is all that has been aimed at. There is a difference between the two classes of subjects, and a difference between the two kinds of mental faculties.

Upon the intellectual differences, however, of the extreme *literateur*, and the extreme *savant*, it is needless to enlarge. The one is strong in the history of opinions, isolated facts, authorities and the like; the other in principles, concatenated phenomena, and forms: the model mind, in which the two strengths are exactly balanced, being

"The faultless monster that the world ne'er saw."

That Comparative Philology requires scientific rather than literary aptitudes is certain: though in ordinary scholarship, where language is the object of an art, the exact reverse is the case.

Stronger still in favour of the application of the term Science are the inferences from the method of philo-

logical investigation. In this respect, with its arguments from effect to cause, from the later to the earlier, from the known to the unknown, it has exactly the method of Geology—that typically palæontological science. At the same time, like geology, comparative philology is a history. It is a record of events in sequence, just like a common history of Rome or Greece. It covers more ground, and it goes over a greater space: but this is a question of degree rather than kind. It is a material history rather than a moral one: but this also is only a difference of degree. It is *not*, however, History in respect to the way in which its facts are obtained: inasmuch as, whilst current history gets them from testimony, and proceeds in its *narrative* from the earlier to the later, palæontological history reverses the process, and, proceeding from the later to the earlier, *infers* as it recedes. Now for this method, scientific rather than literary aptitudes are required.

As little, however, as the absence of the accidental and the arbitrary, will the existence of scientific aptitudes or the palæontological method make a science, in the strict sense of the term; although it may make both an actual approximation to one, and a science *in posse*. Neither will simple certainty. The knowledge a man has of his own existence, whether material or immaterial, subjective or objective, at the moment he is thinking about it, is certain enough for anything, but it is not a scientific certainty. The knowledge, of another kind, that a logically-constructed syllogism gives a logically-true inference, like the knowledge that two and two make four, is equally certain: but the certainty is formal rather than scientific; and, if the word philosophy were not at a discount in England, truths of this kind might be conveniently treated as truths in philosophy rather than as truths in science.

For Science, as a term, to be sufficiently limited to be useful, it must (I submit) imply knowledge beforehand,

i. e. law and prevision, or rather prevision through law. No mere record can become a law. A law looks forwards; its essence being the anticipation of contingent cases.

The question is, of course, one of definition, and I think that both etymology and practice justify the suggested limitations.

Let, then, the position of any given branch of human knowledge, as a science, be determined by the number and the generality of the laws which it exhibits—laws which imply a force, and which, doing this, are notably different from the mere forms and conditions of the mathematician and logician; from which they are to be distinguished on the one side, just as they are to be distinguished from the method of the geologist on the other. If this be the case, the physical sciences, properly so-called, are the typical ones. From the standard suggested by these, comparative philology is, without doubt, far distant; so that, just in proportion as these are our measures, comparative philology is other than scientific. On the other hand, so far as the methods of the geologist, or the forms of the logician, are scientific, comparative philology is scientific also. At any rate, its method is that of the geologist. Add to this that its results are those of the historian, and that its application is in the domain of the psychologist. All beyond is a matter of definition rather than fact.

In respect to its bearings upon other branches of knowledge, over and above those general and indirect ones which every study exerts over every other, comparative philology has several definite and special claims to attention. In what we may call pre-historic history it is of primary importance. Upon logic it bears decidedly, and strongly. No logician has yet written at all who would not have written better with even a smattering of comparative philology. That language is the instrument as well as vehicle of thought, is a state-

ment to be found in most logical works. Without a single detail in the way of illustration, this is, at present, little better than a platitude. Without the phenomena of language, logic is a mere *à priori* symbolism. Perhaps, in its properly-purified form, it *is* this. But why talk about instruments when even the names of the chief tools are unknown?

As a disciplinal study we get its measure in the extent to which it finds a place in the English educational *curriculum;* where, though denuded of principles and with an eminently artificial grammar, it still predominates: asserting its intrinsic value in spite of inordinate disadvantages.

In psychology, on one side, and in special scholarship on the other, it finds its chief auxiliaries. Only, however, will these become important when special scholars and psychologists, each in their own department, shall have combined, with their proper subjects, the instructive study which gives generality to the one and great masses of relevant facts to the other.

ADDENDA AND CORRIGENDA.

A DEFENCE OF PHONETIC SPELLING.

SECTION I.

PREFATORY REMARKS.

The present contribution to the cause of Phonetic Spelling is separated from its predecessors by an interval of more than thirty-five years. Between the beginning of 1834 and the end of 1835 three short works upon the same subject were published in quick succession.(1) Signs of zeal of this kind stand in strong contrast to the silence by which they were followed. It is not, however, without a purpose that they are referred to; for the dates are meant to show that I am neither a recent convert nor a laborer of the eleventh hour. Indeed I may truly say that, from first to last, the subject has rarely been out of my mind; so that I have watched with interest what others more courageous than myself effected during the interval. Much was done then; more, however, has to be done now: for the present time not only encourages additional exertion but imperatively demands it.

It is not, however, as a mere observer that I trouble the reader with this introduction, though the difference between the state of opinion in 1872 and 1835 is sufficient to command our best attention, and to awaken our most sanguine expectations. What I more especially wish to show is that, if I have not been able to form something like a matured judgement on the question, it has not been for want of either time or opportunity.

Again, I have no system of my own either to advocate or abandon.

Taking these two facts together we have, perhaps, the elements of a dispassionate criticism.

1. "An Address to the Authors of England and America, on the Necessity of Permanently Remodeling their Alphabet and Orthography," etc. By R. G. Latham, B.A., Cambridge, 1834.

"Abstract of Rask's Essay on the Sibilants, and his Mode of Transcribing Works in the Georgian and Armenian Languages, by Means of European Letters; with Remarks." By R. G. Latham, B.A., Cambridge, 1834.

"A Gramatical Sketch of the Greek Language." By R. G. Latham, B.A., Cambridge, 1835.

possessive, or genitive, case. It spelt *plucked* as *pluckt*, and *father's*, etc., as *fathers*. There was no want of good reasoning in favor of the change, which was indeed so far from being a radical or revolutionary innovation that it was a restoration of the orthography of a better age; and, as such, wounded no one's conservatism. Nevertheless, it was, after a short trial, abandoned by its distinguished proposers. One part of the paper in support of it was the absolute annihilation of the doctrine that the *'s* of the genitive was the *his*, in combinations like "Christ his sake." It clenched the last nail in the coffin of this venerable grammatical error.

Now the interference on my own part with the received spelling was extended to—

1. *C* with the power of *s*. This was changed into *k*; giving us such combinations as *obskurest*, *kalkulate*, and the like.
2. The substitution of *kw* for *qu—kwestion, ekwalli.*
3. The same in respect tu *gu—langwages.*
4. *I* final for *y—ekwalli, properti.*
5. The substitution of the semivowel *y* for *i* in diphthongs; one of the leading principles of the work being that the number of vowels in a word should in no case exceed the number of syllables *—neynteenth, descreybing, leyk, wreyters, leyf*, etc.
6. The same principle substituted *w* for *u* in *abowt, amownt, pronownce*, etc.
7. For *p* was written *f—frases, filosofi.*
8. For *x*, *ks—ekspress.*
9. For *probable, middle,—probabl, middl.*

I am not now prepared to say that, if nine alterations were to be made, these were the best to begin with; yet I think that, as a group, they made a legitimate collection of samples.

My defence for thus investing my lucubrations with this parti-colored dress (or undress) was on the principle so well laid down in a short illustration of, I believe, Eastern origin:—"If you have a handful of truths, open it by one finger at a time." This was probably a mistake. For the introduction of the whole body of the wedge it was too little; for merely the thin edge, it was too much. Of course, the body of the pamphlet consisted mainly of the anticipation of objections, and the suggestion of the nature of the new signs required for the completion of the English Alphabet. From anything like the entire creation of a new letter I shrank, either from an acquired knowledge of its difficulty, or instinctively. Indeed, I had no inducements to aim at originality at all. For the *u* in *but* I proposed either the Greek *ʊ* or an inverted v "ʌ." For the *a* in *fate*, and the *o* in *note*, I suggested *æ* and *œ*; both of which I now condemn. For the *a* in *fat* "ӕ," i.e. the diphthong *minus* the line which connects the extremity of its right-hand bend with the central column. This I abandon. So, also, I abandon *i* without the dot, ("ɪ") for the *i* in *pit*; and so, also, *ü* (*u* with two dots) for

the *oo* in *food*. The only sign which I at present should care to defend is ɯ for the *sh* in *shine;* and, even here, the aid of a committee of printers would be required to put it into form. I think now, as I thought then, that if we could only get the small letters, the capitals might be left to develop themselves; holding, however, most decidedly that the small must be equally as well fitted for writing as for printing.

But even in the case of the new letter I have suggested, I am prepared to take the facts of the present time as I find them. The Phonetic Alphabet of the *Phonetic Journal*, I accept as it stands; with a few exceptions, which I leave to the judgement of time.

The only new letter then which, under any circumstances, I should feel inclined to defend, I leave undefended. It was no creation of my own; but a sign taken from Rask's "Essay on the Sibilants," which I was then translating.

This Essay and the Greek Grammar belong to Metagraphy or Transliteration, rather than to Phonetic Spelling in the strict sense of the term. The former will be alluded to in the sequel.

Such were my early but forgotten productions,—still-born innocents. The writers of the Gulielmian age, of whom so much had been asked, did, of course, just nothing at all for them. Indeed, for my own part the little I know about them is as follows:—

One copy of the Essay on the Sibilants was certainly sold; for, some years afterwards, it appeared in a sale-list with the rest of the library of Mr Forskal of the British Museum.

Of the "Address" I heard that a copy was ordered by a circulating book-club in the country, and that "three weeks" were allowed to each member for the reading of it. It was republished by Mr Pitman, in his *Phonetic Journal* for July, 1859.

Thirdly, for the Greek Grammar in English letters, there was an actual wholesale order. It was given by a friendly bookseller at Eton who remembered me as a boy. I thought it was done for old acquaintance' sake, and was sorry to hear that the venture had been an unsuccessful one. But the sad truth came out at last. He had taken it for a *comic* Greek Grammar, and was both surprised and hurt when the few premature and precocious purchasers complained of it as an imposition. "They could not, for the life of them, see the fun in it." Nor, when stock was taken, did he.

I may perhaps be allowed to quote here the opening and concluding paragraphs of the "Address to the Authors of England and America," which attempted something—in a field that has since been diligently and profitably cultivated—and effected nothing.

Messieurs and Mesdames,

The obscurest individual amongst you, as well as the most celebrated, works equally, though in a different degree, towards the production of what may be called the literature of the age we live in. I think it highly probable, that in describing the modes of thought of the nineteenth century, some future historian may express himself in phrases like the following:—

"About this time, knowledge ceased to be the exclusive property of the learned

and the secluded. What Socrates did for philosophy, the writers of the Gulielmian age did for every kind of knowledge; they brought it down into common life, and men then began to form themselves into societies, not for the sake of pursuing, but of diffusing it; and works written professedly for the people came to be distributed at prices which a few years before would have appeared incredible. These productions of the press were meant for the information of the lower—they succeeded only in enlightening the middle classes. It never struck the promoters of such liberal schemes, that the chief embargos upon knowledge consisted not in the scarcity of books, or in the abstruseness of such of them as had been written with no especial view of being adapted to the most uninformed apprehension, but that the cause of the evil was more deeply rooted, namely, in the excessive difficulties which presented themselves in the first approaches towards knowledge, which arose from the complexity of the mode of spelling then in use, sufficient to give a distaste for every thing which books could teach, to all such beginners as were not gifted either with iron assiduity or instinctive genius. It never struck them, that although there was no royal road to knowledge, it was by no means incumbent on them to keep the usual one clogged up with unnecessary obstacles; and the amount of the distaste for studies such things tended to create, none seemed to have taken the trouble to calculate."

The following pages contain an attempt to obviate such remarks, and to render the very elements of mental improvement of as easy attainment as the nature of the things will allow, by the substitution of a complete for an incomplete orthography: and I address it to those in whose hands alone lies the power of introducing or rejecting alterations.

The author's proposals were then detailed at length, and the subject was urged upon the attention of the writers for the press by the following concluding remarks:—

A change from the present to a better state of things is not to be brought about suddenly, nor is it desirable that it should be so. Innovations must succeed each each other slowly, but they would take place, and they would in the end succeed, if every man, in the least degree awakened to what ought to be done, would either himself introduce, if he be a writer, some alteration; or, if he be a reader, hesitate to condemn such authors as do so. A mighty change might be effected, with very little additional trouble given to the reading public, if even half those who appear in print would exert themselves to differ from the received orthography, even no more than Mitford does in his history of Greece, Hare and Thirlwall in their translation of Niebuhr, or Oliver in his critical grammar of the English language, or the author of the present work in the sheets now perused. Thus one might confine his innovations to the substitution of *z* for *s* in the plurals; another may write "ʌ" for *oo* in such irregularly written words as *blood, flood;* and a third use the semivowel for the vowel in such diphthongs as *house, oil.* But the true adaptation of the letters of a nation to its language will begin with the introduction of one of the new signs ð, þ, *etc.* We must not, however, shut our eyes to the fact, that be such a change brought about as it may, the present and the next generation will have two alphabets to learn: this I think is the maximum of the inevitable evil which attends all innovations. To such as ask in what degree the present change is to be oonsidered a final one, I can only answer that I see at present not the most distant prospect of the growth or introduction of anything like a new sound; but I will neither deny that the observations I have made on the use of the letters *r* and *u* involve some idea of a change in the pronunciation of the combinations those two letters form; nor that future innovators may arise and argue that it is abstractedly right that such letters as we have derived from other alphabets, should in our own keep that force, and that force only, which was given by the nation that invented them; nor that, for the sake of making our language of easy attainment to foreigners, and foreign

languages as little difficult as possible to ourselves, it may be practically advantageous that such sounds as the majority of European nations agree in attributing to certain letters we attribute to the same letters ourselves. In the first of these cases, *y*, as the descendant of *v*, a vowel sound, will be ejected from a language where the sound it was invented to represent is wanting; and in the second, a substitute will be procured for *j*, and *j* be sounded as *y* is at present, on the plea that the present power we give to *j* is unique and singular: and if the plea, that in printing diphthongs, the true elements must be given, avail, *æy* or *æj*, *a°y* or *a°j*, and *aw*, will be substituted for *ey*, *oy*, and *ow*. Greater changes than these I can conceive no innovator who will venture to propose, or any alterations in our language which it will demand. But for fear lest I be considered to overvalue the evils of a thing so apparently unimportant as the fact of having twenty-four letters instead of thirty, or three modes of spelling a word instead of one, I must observe that the full weight of the embargo, both upon the attainment of information in respect to individuals, and the diffusion of it over masses of population arising therefrom, is all the less evident, because it is exactly in proportion as a man is possessed of literary acquirements or mental capabilities, that the difficulties he had to get over before he was enabled to read, and therefrom arising narrowness of his escape from a distaste to study, are less vividly impressed upon him. In his attempts to calculate such things, he can hardly be said to proceed upon any experience in regard to feelings he has forgotten; he must infer, as it were *à priori*, that such difficulties as he finds our alphabet to cause, would create so much discouragement in a child's mind, just as he would determine that all such practical knowledge as that *fire burns*, *ice chills*, etc., is the fruit of a series of unpleasant though forgotten experiments. Many early feelings must be re-embodied by my readers before they will be able to appreciate the arguments on which most of what has been written depends. As to the value of my own evidence on such subjects, I may truly say that I am possessed by no such blind enthusiasm as would shut my eyes to the difficulty of effecting such a change as the one proposed; still less am I conscious of having one iota of that feeling which too often prompts people to exhibit plans, not in order that the public may value them for the good they work, but for the specimen of acuteness they may display on the part of the projector. Moreover, the system I would introduce is far from being so exclusively my own as to generate any undue parental partiality. The investigations which led me to it lay among the works of writers the least likely to communicate their enthusiasm: whilst the admission that forming a system with reference to nothing but the standard of perfection, and adapting new improvements to an imperfect state of things previously existing, are things entirely different, I am less unwilling than unable to remedy imperfections arising from the nature of the alphabet I have to, as it were, engraft them upon, should prevent the giving to the thing proposed even a *primâ facie* appearance of its being a mere theory.

If I thought my attempt destined to share the fate of many such as have gone before it and been similar to it, and that it was doomed to be raked up from the pit of oblivion only in order to be held up as a warning to others of the futility of such like efforts as the present one, I should most certainly withhold it from the public, valuing, as I ought to do, their time and my own: but I am encouraged by finding, that of the many who have expressed a wish for alterations, few have in the smallest degree *adopted* any; and of those who have adopted any, few have detailed their reasons for doing so. The public, most naturally, place little reliance on a person who embodies his abuse of an alphabet in words spelt literatim in the mode he complains of, and still less on one who, if he does not leave too much to their penetration, seems to pay too little deference to their usages.

It is but equivocal advantage that the present attempt is in no wise a party cause, as, if it were so, men might be brought to think upon it, and their feelings might be enlisted on the side of their judgement; but so much is it the common

interest of every man who speaks English, that it is the business of everybody—which is nobody; and the idea of its being this is what ought especially to be guarded against. Great as the change from wrong to right is, it may be brought about without either the aid of academies or orthographical societies, if only a majority of those who read and of those who write would not so much convince themselves of the necessity of such a reform, but of the power each individual has to promote it; and the exertions necessary thereto consist in little more than the conquering of a prejudice, and the acting upon their conviction.

To transmit the birthright of civilisation which we derived from our ancestors unimpaired, and, if it may be so, improved to our posterity, is a social duty; and when the trouble each individual will have in clearing away the rubbish on the high road to knowledge is not greater than that of accustoming himself to write or read such a change as there is from *cat* to *kat*, at such intervals as may allow the innovations to accumulate until confirmed by custom, and the full necessary change have taken place—I say that that man is selfish who will not submit to it.

And be it remembered that the introduction of new letters touches with us no national prejudice, as it did with the Danes, with whom *a°* was objected to as a substitute for *aa*, on the ground of its being Swedish; nor is our present *a b c* entwined with any ideas of national glory and triumphs gone by, as is that of the Greeks. Our own alphabet, even in the best of times, was at best but a transfer from the Latin; the only original parts of it, Þ and Ð, are rejected: the alterations it underwent in the Norman times are tokens not of our glory but our subjugation. The natural shortness of life is not more curtailed by waste of time on the part of ourselves, than the unattainableness of universal knowledge is aggravated by the multiplicity of its unnecessary obstacles. The division of labor is as important in literature as in manufactures; and if we of this age are bound to do for our posterity what our ancestors have done for ourselves; and if each era has its own peculiar modes of thought, and the universal culture of the intellect be so much a feature of the present one as to lead the many to confound it with superficialness, is that man who labors to exhibit in the most intelligible point of view that which is already discovered, serving mankind and earning their gratitude, one whit less than his fellow, who, with no greater genius, but more ambition, seeks to add to the stock of knowledge, leaving its diffusion to others? Both employments are undoubtedly of the highest nature, and neither must be raised at the expense of the other; but the one who, by rendering dark things light, and good things common, makes two intellectualists where before there was but one, adds to the number of laborers in the vineyard of knowledge; and by multiplying the quantum of thought in operation, finally, though indirectly, not only spreads wisdom more upon the earth, but also brings down more from heaven.

I confess I know no poetry equal to the contemplation of that intuitive and instinctive acquirement, and that unbounded substitution of intellectual for physical power, which must and will take place when there is not in any one branch of any one kind of wisdom any other let or hindrance than those which lie either in the nature of the subject itself, or in the insufficiency of the mind working thereon.

SECTION II.

THE VALUE OF THE PRESENT TIME FOR ACTION AND CO-OPERATION.

It has been indicated in the preceding section that a time has now come which differs from the days which went before it, in being exceptionably favorable. This is not a matter of degree, but of kind. The question of simple education has been long before us. The present, however, is a time of *compulsory* education. It is more

than this; it is a time of *subsidised* education. More still, it is a time of *self*-subsidised, *self*-sustained, and *self*-supporting education: education which must be its own great reward; and education to which every one who is benefited by it must contribute. This brings it within the domain of the Chancellor of the Exchequer, and the Commissioners whose business it is to make the most of all existing educational endowments. Great powers are claimed for raising new, and utilising old funds; the old endowments are to be diverted, and new rates to be laid, for the sake of the one great object of education in general.

The end justifies the means. But the means are (what, to the same extent, they have never been before) exceptional; and the very fact of their being so must be taken as an element in the price paid for an inordinately superior advantage. Nevertheles, it creates a second party in the affair: and it does not follow that, because we get a great boon or profit, we are precluded from looking closely into the details of the bargain.

Here, except as an item which always commands attention, I put the money element out of the question. The incidence of the taxation falls on the more valuable article time: for time, so valuable to all, is of double value to the working man. If education, however, is made a matter which takes from him double, treble, four times, etc., the amount which is absolutely necessary, a wrong is inflicted upon him; and this unnecessary waste may easily induce him to prefer the existing state of acquiescent ignorance to that of compulsory enlightenment. Perhaps he may be burning the candle at both ends; or, be himself a ratepayer paying rates out of the money which his son, when dismissed from bird-tending, fails to earn. Such is his condition. The skilled artisan of the towns, himself, to a great degree, in the same predicament, may, perhaps, teach him a broader view of such matters;—may, indeed, persuade him that all is for the best. Let us assume that he does so. There is still a point on which both can agree; namely, that whatever be given in return for the immediate loss should be given in return for as slight a sacrifice as possible.

Here I pause. The moment it is shown that the art of reading and writing can be obtained at the price of so many shillings or so many days less than the amount which the constrained education of his son charges, he has a matter which touches him most closely. The particular case may be phonetic spelling, or it may be anything else. At any rate, it is a matter for a large class to look to, and, as the day has now come when this class can not only judge for themselves, but have a voice in the decision, I submit that I am justified in speaking of the present time as one which we have not seen before, and one which we should not allow to pass by.

SECTION III.

THE "FƟNETIK NUZ," AND THE "PLEA FOR PHONETIC SPELLING."

The publication of the *Fønetik Nyz* was the first practical appeal to the public. It let them know what a radical reform really was. It told them that our alphabet was completed, and showed them what the completion led to. It was, in short, an accomplished fact. It attracted attention; and the question was permanently set afloat. It was canvassed, upon the whole, fairly. The objections fell under two heads.

Everyone thought there was some particular letter which might be improved; and when twenty different persons picked out twenty different letters, the whole alphabet was broken up in detail. It was like the Mahometans who eat the whole hog; each by abstaining from some particular part while they made free of the remainder. Still more like was it to the immortal coat in the Tale of the Tub; where each brother preserved what the others relinquished, and relinquished what the others chose. It was soon found out, however, that letters were not easy things to extemporise: and that the alphabet, if taken at all, must be taken as it was found. Upon this principle the present treatise is written. We have got our tool, and no good workman will complain of it until he has been lucky enough to supply himself with a better.

Other objections lay against the principle. Upon this Mr Ellis's "Plea" may speak for itself. (§ 31). He gives them all in detail. There is (1) the *Etymological Objection;* (2) the *Homonymical Objection;* (3) the *Pecuniary Objection;* (4) the *Linguistic Objection;* (5) the *Conservative Objection;* (6) the *Pronunciative Objection;* (7) the *Double Trouble Objection;* (8) the *Strange Appearance Objection;* (9) the *Vocalistic Objection;* (10) the *Book Dearth Objection;* (11) the *Typical Objection;* (12) the *Phonetical Objection;* (13) the *Inutility Objection;* and (14) the *Partial Success Objection.*

At the present time every one of these objections is abated; and I may add that, when the "Plea" was written, every one of them was anticipated.

Of the theoretical ones, the *Etymological* is the only one which is at all formidable; and it is this more on account of the intellectual culture and influence of the class of writers who maintain it, than from its own intrinsic validity.

The practical ones have answered themselves. The *strange-appearance objection* is so much a matter of taste as to be unfit for argument: though it is well to recognise its existence. The *conservative* and *inutility objections* are mere negations. The *double-trouble objection* must be dealt with according to the teachings of experience; for it turns upon the question as to what we pay as a price and what we gain as a benefit. Upon the answer to this every

advocate of Phonetic Spelling has, of course, made up his mind. On the other hand, he must, if he desire to make proselytes, convince others. The *book-dearth*, *typical*, and the *partial-success objections* no longer exist; not, at least, in the way they existed when the "Plea" was written. There is now no *book-dearth* at all; and there is a great deal more than a *partial success*.

The *Homonymical objection* lies midway between the two divisions. It applies to words like *wright*, *write*, *rite*, and *right*; and to others besides. If they were all written alike, how could we distinguish them? But how do we distinguish them when they are used in conversation, and address themselves to the *ear* only, without fear; that is, when they are all *spoken* alike. Easily enough. The context is a sufficient guide. But suppose that it be not so? We may reply to this question that "when a case of real ambiguity occurs, it will be time to think of the remedy." If this be ignored as a mere haphazard answer, another, of a more general character, may be substituted for it. It is the function of writing to *represent* language, not to improve it: just as it is the business of a portrait-painter to take the features of his sitter as they are presented to him by the proprietor as he sits. He must take each with his own proper character for the time being; wholly irrespective of any differentiation between him and his *alias*. If the principals or their friends do not know which is which, it is their business. They will probably, if a distinction be really needed, find means of discriminating between them. I do not, however, say that in some very poor languages, and in some exceptional instances, some diacritical mark may not, on rare occasions, be needed. I have heard of such things in China. I have read of such things in the language of the Arrapahos of North America; but I have tried to find an instance of it in English, and failed; though, of course, if a person taxed his ingenuity to invent one, he would probably succeed.

Thus far the question is a point of practice; and I by no means deny the possibility of its being, in some extraordinary instances, a practical one.

In theory, or from the scientific view, the matter stands on a different ground. *Rite*, *right*, *write*, and *wright* are words originally different; and this original difference may be a fact, not only worth preserving, but going out of our way to preserve: for it is a detail in the history of four words—interesting to say the least of it; possibly instructive. Be it so. But the *fusion* of the four into one, is just as historical, just as interesting, just as instructive. And this the present spelling entirely conceals. One piece of history, in short, is exhibited at the expense of the other. It is doubtful, however, whether any good reason for the preference can be given. Surely, then, instead of raising a discussion upon the doubtful point as to which of two facts should be sacrificed to the preservation of the other, it is better to keep aloof from the question altogether; and this we may do by the simple principle of limiting the spelling

to its proper and exclusive function—the representation of the sounds of which it consists.

Upon the *Pronunciative objection* something will be said in the sequel, when the merits and demerits of the French orthography come under notice.

In one point and in one point only, Mr Ellis's classification seems imperfect. Perhaps he meant it to belong to the *double-trouble objection*; but according to his narrative there was no trouble at all. Miss Mitford told him that at two years old she read the newspaper, showing off her ability in doing so. No one was likelier to have done such a thing if it could be done at all. Mr Ellis, however, may have been too polite a man to say this. He might, however, have said that if she read the paper of the day in the twenty-fourth month of her infancy she would have read the *Fonetik Nyz* in the twelfth. All that this anecdote proves is that Miss Mitford was not as other children are. Upon the ease with which our ordinary spelling may be learned by ordinary readers it is no evidence whatever.

The time for enumerating and exposing the numberless redundancies, defects, and inconsistencies of our alphabet has, probably, gone by. Denunciation and ridicule may, possibly, have done their duty; for there is a time for all things, and, except on the platform, there is now but little inducement for a reformer to be either funny or indignant. Hard names and strong epithets have, doubtless, done good service in their time, and may, perhaps, do it again. At present, however, there is no one in particular to be blamed, for it is no one's fault that our alphabet is as bad as it has been proved to be. Nor is it the fault of the alphabet and the orthography themselves, though it is their misfortune. The vices of our system have either grown with its growth, or have been forced upon it; and, in the opinion of the present writer, the best way of convincing the public of their existence is to trace them to their origin, and note the stages of their development. By doing this we account for them; perhaps we may be said to excuse them. But what argument is so decisive as to the existence of an evil as the exhibition of the circumstances under which it attained its dimensions, and the evidence of its being neither more nor less than the natural result of the conditions by which it was preceded? Or what is more condemnatory than the excuse which coincides with, and even anticipates, the accusation? Whatever may be the case in other respects, it is certain that, when we take the subject from this point of view, we put ourselves in the place of our opponents, and, in doing this, are in the best position for a clear understanding of the matter under discussion.

SECTION IV.

THE ENGLISH SYSTEM OF SPELLING AT LEAST TWELVE HUNDRED YEARS OLD—OF LATIN ORIGIN.

The single point upon which all who have taken the pains to form an opinion agree, is the bad pre-eminence of the English language in respect to its spelling. Upon this the most conservative defenders of the existing system and the most advanced innovators are of one mind. In the eyes, perhaps, of the most partial of the former, the French orthography may be backed against our own for badness. The respective demerits, however, are scarcely commensurable. However artificial may be the system of expedients by which the French attempt to combine Etymology and Phonēsis, the application of it is comparatively regular, consistent, and systematic. That the system is long in learning is beyond doubt. Nevertheless, when once mastered it can be used. It is not pretended that this is the case with English. At any rate we have this remarkable fact before us, namely, that of these two among the leading languages of civilised Europe being the two in which the representation of a fine form of speech, and a valuable literature, is the most imperfect. We may deplore this, or we may be unwilling to say too much about it. We may look about for a remedy, or we may give up the case as hopeless. Sometimes we may take the pains to expose the more egregious defects of the alphabet of Shakspere and Bacon; and sometimes we may find a grim, malicious pleasure in ridiculing them. Out of all this good of some kind may come; for the public at large may be thus informed of the extent of the evil, and the essential conditions of a reform may be thus established.

It is better, however, (though the attempt may be mistaken for a defence,) to inquire into the causes of such a result. What makes the French orthography so much worse than the Italian or the Spanish? What makes the English so faulty, as compared with the German or the Danish?

One answer to this presents itself at once. The English alphabet, with its corresponding orthography, is, if not the oldest, one of the oldest of the class to which it belongs—the class being that of those languages whose alphabet is derived from the Latin; namely, those of Germany, Holland, Scandinavia, England, and America; of Wales, Scotland, and Ireland; of France, Portugal, Spain, and Italy; of Poland, Bohemia, and Dalmatia; of Lithuania and of Finland;—in other words, the languages of Western Europe in general; as opposed to the Servian and the Russian, of Greek origin. This division, which nearly coincides with that of the Roman Catholic and Protestant forms of Christianity on the one side, and the Greek Church and Mahometanism on the other, is thoroughly natural. And, as the division is natural, so is the distinction between a Latin and a Greek framework important.

Though this comparatively high antiquity of the English alphabet

is a matter which scarcely requires proof, it is one which is very likely to be overlooked. Compared with the alphabets of Greece and Rome, *all* the alphabets of modern Europe are of recent origin. The English, however, is older than most of them. It had, probably, taken form, and been applied to spelling, as early as the first quarter of the seventh century, if not earlier. The general rule in the history of the introduction of an alphabet into the languages of modern Europe is that it coincides with the introduction of Christianity; so that where the Gospel enters, civilization and literature follow. Now this means something more than the mere art of spelling. It means the cultivation of the language to which the alphabet is applied; and as this may take place under very different circumstances, it is very uncertain in its extent. In the great countries of France, Italy, and the Spanish Peninsula, where not only the alphabet but the language was Latin, the practice of *writing* the native tongue came late: for, though the use and the value of the alphabet were known, the only language that was written by means of it was the *Latin*. Such being the case, we can scarcely compare the alphabets and orthographies of France, Spain, and Italy, in point of antiquity, with our own. The alphabets themselves were, doubtless, as old as the Roman conquests of the different countries. The application, however, of them to the vernaculars of the land was, in all cases, comparatively late.

The first specimen of the language of Gaul, or France, dates from A.D. 842. It is the oath taken by Charles the Bald, the son of Charlemagne, by which his quarrel with his brother Ludwig was checked. It is a hundred years later than a very well spelt fragment of an Anglo-Saxon specimen quoted by Beda. It is Provençal rather than French. Still, it stands alone, nearly two centuries earlier than any succeeding piece of either French or Provençal of equal length. It is fairly spelt; the spelling, however, is not French in the ordinary sense of the term. Except, however, in the combination *dh* in *ajudha* and *cadhuna*, it is Latin orthography applied to a Latinising language.

Pro Deo amur et pro Xristian poblo et nostro commun salvament d'ist di en avant, in quant Deus savir et poder me dunat, si salvarai eo cist meon fradre Karlo, et in ajudha et in cadhuna cosa, si com om per dreit son fradre salvar dist, in o quid il me altresi fazet: et ab Ludher nul plaid nunquam prindrai uni, meon vol, cist meon fradre Karle in damno sit."

In Britain and in Germany the case was different; for in Britain and Germany the languages were not of the Latin, but of the Keltic, and Teutonic families. In Britain, then, and in Germany the Latin alphabet was applied to the native languages earlier than elsewhere. The Polish, Bohemian, Lithuanian, Fin, and the other less important alphabets of Latin origin are of much later introduction; the conversion of the countries to which they applied being later than that of either Germany or the British Isles.

Our A.B.C, then, has been in work for upwards of twelve hun-

dred years; though this as compared with the age of the Latin and Greek alphabets is a short period, it is a long one compared with many others. But this, though manifestly true as a matter of fact, is of too general a nature to be explanatory: and a more specific reason is required. We shall find this, to great extent, in the diference already alluded to between the Greek and Latin alphabets as models, or frameworks, for the several secondary alphabets derived from them. The Greek was decidedly more phonetic than the Latin. Where the Latin made no distinction between the long and short *A* and *O*, the Greeks had their *Epsilon* and *Eta* (ε and η) along with their *Omikron* and *Omega* (ο and ω). Where the Latin spelt the sound of *th* with two letters, or by means of an artificial combination, the Greek wrote θ or Θ (theta). Thirdly, the Greeks used the letter κ (kappa) wherever it was wanted: the Latins eschewed it, and used *C* instead. What this eschewal has led to we shall see in the sequel.

Though the Latin was the worst of the two models, there were degrees in its inferiority; or, to speak more correctly, there were some countries in which there was a Greek influence as well, and, by means of this, either improvements in the adaptation of the Latin letters were effected, or certain faults were avoided. In continental Germany, for instance, the *k* not only got admitted into the alphabet, but kept, and continues to keep, its ground. The first German alphabet, however, was of *Greek* origin. In Britain the influences were more exclusively Latin, and the *k*, though admitted, so to say, upon sufferance, was long treated as a stranger. At the present time, indeed, it is recognised; but whoever turns to a dictionary and counts the words which begin with it, will find that they are far fewer to the eye than to the ear, the reason being that more than half of them are found under C. At first, however, *k* was kept out of our alphabet altogether: simply because it was avoided by the Romans. But even in the Latin spelling it presents itself exceptionally. In fact, though a letter which, in all the alphabets of Latin origin, lies under disadvantages, it is one which, sooner or later, shows itself. At present, however, it is sufficient to connect its absence in a system of spelling with the Latin origin of the alphabet.

SECTION V.

THE ALPHABETS AND SYSTEMS OF SPELLING WITH WHICH THE ENGLISH MUST BE COMPARED.

The English alphabet, then, is an old one, and, more than this, an old one which from the beginning was formed upon an indifferent model. This was the Latin; but in the Latin, as a model or a framework, there were degrees. There was the Latin pure and simple, with no second influence to disturb it; and there was the Latin in certain quarters where Greek influences might, possibly,

be at work by its side. From the Latin in its more exclusive form the English art of writing was, probably, derived. This brings us to closer inquiry as to the details of its origin; for all that has hitherto been said about it has been of a very general nature. The Latin origin has been indicated; this, however, was done chiefly with the view of contrasting it with a Greek one. The question whether it was got directly from the Latin, or through some secondary language, still stands over; and though twenty years ago the inquiry would scarcely suggest itself, it is, at the present time, an important one.

Again; the beginning of the seventh century was only given as an approximation. All it meant was this,—that the English language was one of the older ones of Europe. How it stood in this respect with certain languages was only indicated. The antiquity of the alphabets of the languages of the German (Teutonic) and Keltic families, as compared with those of the languages derived from the Latin, and those of the Slavonic and Lithuanic families, was put prominently forwards; or changing the expression, the application of the Roman alphabet to the Italian, Spanish, Portuguese, and French languages was shown to be recent. These, then, were eliminated from the field of comparison, which was thus narrowed to two families.

Of these (1) the Keltic gives us *two* alphabets, orthographies, or systems of spelling, both derived not only from the Latin, but from the Latin in its more exclusive form. They were both, of course, applied to languages other than Latin,—the British (Welsh) and the Irish (Gaelic). They were both connected with the same form of Christianity, that of the British Church. They were both, as far as we can judge, originally formed on the same principles, though afterwards they diverged, and are now to be contrasted, rather than compared with one another. We must take a very extreme view of the unimportance of the Early British Church, unless we assign to the Irish and Welsh orthographies a very early date. In any case, they are as old as the English; and probably, older. It will scarcely, however, be maintained that either of them has been subjected to the same amount of modifying or disturbing influences. Add to this that one of them, the Welsh, has been remodeled; so that, although at the present time the Welsh orthography is, in some respects, one of the best in Europe, it is not one which can be said to have either a long and active, or a sustained and continuous history.

2. *Three* alphabets may be assigned to the Teutonic or German class of languages, (*a*) our own, the English; (*b*) the German of Germany; (*c*) the Mœso-gothic. Of these it may safely be said that the third in the order here given is the oldest. But the whole literature of the Mœso-gothic consists in the remains of a translation of the Gospels, along with fragments of a fuller version of (probably) the whole Bible, and a few short records of certain sales or bargains

under the reign of the Gothic kings in Italy. The whole era, however, of the Mœso-gothic alphabet lies between A.D. 370 and A.D. 700 —this being an over-liberal estimate. Any comparison, then, of the Mœso-gothic, notwithstanding its antiquity, as a practical working alphabet, with the English is out of the question and, as much will be said of it hereafter in connection with other parts of our subject, this is enough for the present.

In respect, then, of anything like equal antiquity, combined with an equally continuous history, it is only the German alphabet and orthography that can be compared with our own: and it is probable that if we knew the dates of the first-written specimens of either the German of the Continent, or the German of Britain, (that is, the Anglo-Saxon,) we should find but little difference between them. Each has been subjected to the influences of not less than thirteen centuries. In their relative exposure, however, to influences from without, there is no such agreement. There is no such fact in the history of the German language as that of the Norman conquest in England, by which a second language was introduced, a concurrent literature encouraged, and the cultivation of the native language, for more than two centuries, kept in abeyance. As for the mass of foreign words thus introduced, there is no approach to equality: for let us say what we may about the Gothic, the Teutonic, or the German structure of our tongue, it is as decidedly a mixed language as the German is a homogeneous one. Lastly, in respect to their grammatical structure, the English is in a different stage from the German. Notwithstanding, however, all this, the German orthography, though open to much improvement, is one of more than average goodness, while the English is, to say the least, more bad than indifferent.

SECTION VI.

THE PRONUNCIATIVE OBJECTION. THE DEFECTS OF FRENCH ORTHOGRAPHY.

The French, the second worst language in the world for its system of spelling, though far behind our own for badness, owes its faults to a different cause. It was not, like the English, a language belonging to a different family from that of its alphabet; though, like the English, it was founded exclusively on a Latin basis. Two other causes favored its badness.

1. The French of Paris was not the dialect to which it was originally applied: for the Provençal of the South and South-East was cultivated before the French of the North: in fact the Provençal and the French were, and are, two different languages.

2. The language, when first written, was in such a transitional state that it retained at the time when the alphabet was first applied to it, an inordinate number of forms which afterwards became ob-

solete. Yet who could say at what time the change had gone so far that the spelling ought to be accomodated to it? No one. So the language changed while the spelling remained as it was.

Now this brings us to the *Pronunciative objection*. There is a difficulty in selecting the right pronunciation out of several conflicting ones. This, however, is the business of the speaker and not that of the speller: it is a point not of orthography but of orthoepy. All that spelling has to do is to represent such or such a sound, or combination of sounds. Whether it be the right one is to be settled by time. The *Pronunciative objection*, as Mr Ellis truly remarks, is a fault of the language, which it is not the function of the Phonetic speller to amend. Herein it agrees with the *Homonymical*.

And the two agree in this. They are not to be condemned on a mere inspection. Each inculcates the necessity of judgement and circumspection. It is possible that, in some exceptional cases, homonyms may create a deficiency which the context may not remove. And it is also possible, (indeed very probable) that real difficulties may arise which invest with a certain amount of validity the objection under notice. That it is desirable that spelling should have something to do with giving stability to a language few deny. But where and when is the fixation to begin? We are not, on the one side, to stereotype a language until the end of time; nor are we, on the other, to stamp the fictitious sanction of an *Imprimatur* on a word of which the form may be ephemeral or evanescent. These, and a few others, are the points wherein it well becomes us to consider the objections closely, seriously, with a sense of responsibility, and with the free admission of their legitimacy within a proper limit. The questions of *Homonymy*, of *Pronunciation*, and of the extent to which a phonetic orthography may be used for the secondary and subordinate purpose, (for such it undoubtedly is) of what is called the *fixation of a language* are, pre-eminently, those where the innovator must take certain objections from the objector's point of view. He must do so, to some extent, in the matter of etymology; but here he must do so most especially—perhaps, also, in the spirit of compromise.

SECTION VII.

THE REPRESENTATION OF LANGUAGE NEVER KEEPS PACE WITH THE CHANGES OF LANGUAGE ITSELF. THE BADNESS OF THE FRENCH SYSTEM OF SPELLING.

It is well to illustrate the leading causes of the badness of an orthography by giving prominence to the systems of spelling which are most decidedly affected by them. The English is bad, so is the French. Each, however, owes its badness to a different cause.

To a reader who is, at one and the same time, a good Latin scholar and a confirmed upholder of the etymological principle, the

French spelling may, possibly, be rather laudable than the contrary. It preserves the old forms, even though the modern language has rejected them. Thus, though it fails to represent the language as it is, it succeeds to admiration in telling us what it has been; and this in the eyes of an etymologist passes for a merit. Upon this, however, it is enough to say that the etymological objection against phonetic spelling is of more value in France than in England. It is certain also that though phonetic spelling is perhaps less required in France than in England, it would, if applied, disguise the language more;—as far, of course, as the eye, accustomed to the usual orthography, is concerned. This is because, in France, there are two languages,—one for the ear, the other for the eye. But as the two are simply the same form of speech in different stages, there is (great as the contrast between them may be,) a principle, or the shadow of a principle, to give regularity to the system of their difference. The written French is Old French, even as Anglo-Saxon is Old English. In England, however, we have no such consolation, defence, or semblance of a system. In France, if twenty different words are found to differ from each other according as they are spoken or written, or as they are read or heard, there is a class to which each may be referred, and for each of such classes there is a rule. In England there is no rule at all. In this lies the great difference between the two languages in the valuation of their demerits. Yet the English and the French are among the leading languages of the world; second, to say the least of them, to none. But they are, *facile primi*, the first two in bad spelling. The French has been the least disturbed. It has also the advantage of its alphabet and its language belonging to the same family,—the Latin. But this is the main reason for its defects. It has kept up that kind of continuity with the mother-tongue which made the retention of old forms of spelling, long after the language itself had ignored them, so much of a habit as to end in its being a necessity.

This, then, shows what happens when changes of language are not accompanied by corresponding changes in the representation of it; and, as this is one of the main causes of bad systems of spelling, the French language has been chosen as an illustration. At present this is the sole reason for our reference to it, though, when we come to details, it will be again referred to.

SECTION VIII.

THE ETYMOLOGICAL PRINCIPLE.

Much more will be said about this hereafter, because, (as has already been mentioned,) it is one of the great practical points in the phonetic question; not so much on account of its own merits as because it enlists in its defence at least three-fourths of the scholarship of the kingdom. It is here merely foreshadowed in its

generalities, and that because this is its proper place. It is closely connected with what has just preceded it, because the extent to which speech changes rapidly, while the representation of it changes slowly, was well—pre-eminently well—illustrated in the French language. The *old* forms which are still preserved with an appearance of life and reality in the *present* spelling—dead as they are—are preserved on etymological or historic grounds.

In the present section, however, the principle is dealt with in its more general form; for it may exist independently of any change in language whatsoever. It may exist in the most original orthography in the world. It may present itself in a language hitherto unknown; or, when known, absolutely isolated. If so, the accommodation of the spelling to obsolete forms is out of the question. So is it, also, in respect to words derived from other languages; for, in the supposed instance, there is no language with which it can be compared. To illustrate this, and at the same time to show that the case is not an imaginary one, let us suppose that the languages of (say) Tierra del Fuego and of the Andaman Islands are reduced to an alphabet, into which the Scriptures, or some part of them, have be translated. A word which begins with the sound of *s* will have an *s* as its first letter. It will, in no case, begin with a *c*. Why? The ordinary system of representing a single sound by a single letter will take its course, inasmuch as there is nothing to contravene it. In English, however, *sity* might be (as it is) spelt *city*, and we know the reason why. It is derived, indirectly, from the Latin *civitas*. But with the languages here mentioned there is no such thing as a derivation of this kind. Every true native word is spelt as it is sounded.

Nevertheless, there may be, even in languages of this kind, ample room for the introduction of the etymological principle; indeed, it may have existed in the very first language ever reduced to an alphabet.

This, of course, leads to a distinction. Connections in the way of etymology fall under two heads.

1. There are derivations of which the several elements are contained in *different* languages. Such is the connection between *city* and *civitas*.

2. There are others in which they are contained within the *same* language. Such is the connection between *wife* and *wives*.

The former is impossible in languages either actually isolated, or, if derived, of unknown origin.

The latter may exist in the most isolated language existing.

Of each of those kinds we have ample illustrations in our own language. Of the first we find any amount of instances under the simple letter *c*. Why is this letter used when *s* would do as well? Take the word already used as a specimen. *Civis* is the Latin for a *citizen*, *civitas* for a *city*. No matter how the *c* was originally sounded. It was, no doubt, at some time or other, pronounced as

k. But this time went by, no one exactly knows when. After the change into *s*, it passed into the French language. From the French the English took it, but they took it with the French sound or power. And as they found it written, so they themselves wrote it. How or why it was changed is a question which, at present, is unimportant. The simple fact of its changes, and the adoption of the spelling which it gave rise to, are all that is at present under notice. It explains what is meant by the etymological principle as applied to words *not* belonging to the language in which the etymological spelling is found.

We may follow the principle further. The number of words wherein *c*, followed by *e*, *i*, or *y*, is sounded as *s*, may be so great, that the practice of thus sounding it may become universal. Hence it is extended to words where it is followed by *a*, *o*, or *u*. This ended in *k* being practically excluded from the Latin language. Hence, again, as our alphabet was of Latin origin, and as *k* was never formally admitted as a Latin letter, we have come to spell the thoroughly English words *can* and *could* with a *c*, though in German and Scandinavian (or Norse) they begin with *k*. But *ken* (*know*) is the same word as *can*, in a different tense—this and nothing more. *Ken*, however, if spelt with *c*, would run the risk of being sounded as *sen;* and this it is which has brought in the irrepressible *k*, the result being that *ken* is the English spelling of one tense of the verb *can*, and *can* the English spelling of another tense of the verb *ken;* for *can*, though it now means ability, originally meant power or ability *obtained by knowledge*. *Ken* = I know = *can* = I have known, that is, I know, or am able, at the present time.

The words *ken* and *can*, then, show two things; and for this reason they have been brought forward. The etymological principle brought in the *c* instead of *k*, and *can* was spelt as we have just spelt it. But *ken* could not have been so spelt, and *k* was resorted to. Nothing proves better the imperfection and the inconsistency of this so-called principle. It is resorted to in the case of *city* and *civitas* to *show* the connection between the two words; in *can* and *ken* it *conceals* it.

An additional illustration of this principle is seen in *cat* and *kitten*.

3. The etymological principle as it is suggested by forms found within the limits of one and the same language, of which the words *wife* and *wives* have been given as an example, is most conspicuous in two large classes of words, alike in form, though different in respect to their places in grammar. These are the genitive (or the possessive) cases and the plural numbers of substantives, both of which end, so far as the eye is concerned, in *s;* the possessive cases in *'s* (or *s* with an apostrophe), the plurals in *s* pure and simple,—*father*, *of a father*, *the father's son*, *the fathers of the families*. For the *genitive* plural the sign is *s'*, that is, it is the genitive (or

possessive) singular, with the place of the apostrophe transposed, *e.g. the ship's sail, the ships' sails*, according as one or more than one is spoken of. All this has found its way into the ordinary grammars, and is known to even the readers of Lindley Murray. The history, however, of the apostrophe, and the double sound of the final *s*, has not, until lately, had due attention bestowed upon it; neither is it so prominently exhibited in even the better class of teaching books as it ought to be.

It is simple enough. The possessive case in Anglo-Saxon ended in the *syllable "es,"* the plural in the *syllable "as"*—as, *wulf, wulf-es, wulf-as; brid, bridd-es, bridd-as = wulf, wulf's, wulfs; bird, bird's, birds;* where there is only the addition of a letter, and no extra syllable at all. As for the old genitive (possessive) plural it was *wulf-a* and *bridd-a*, so that the English form in *s'* is merely an extension of the *'s* of the singular.

Now as long as the *s* was preceded by a vowel and belonged to a different syllable from that of the main body of the word, the speaker was free to pronounce it in a uniform manner. It might always be sounded as the *s* in *sin* or the *ss* in *ass*. As soon, however, as the vowel was dropped and the two consonants came into contact, the action and reaction between them created a second sound. When the consonant which preceded it was *p, f, t, th* (as pronounced in *thin*,) or *k*, the original sound was retained, and words like *taps, chaffs, gnats, laths*, and *backs* were spelt as they were sounded. When, however, the preceding consonant was *b, v, th* (as in *thine*,) or *g*, the *sound* was that of *z;* and the spelling by which it was represented would give, as the plurals of words like *stab, slave, lad, lathe*, and *nag, stabz, slāvz, ladz, lāthz*, and *nagz:* the change being the necessary result of the contact of two consonants of different degrees of what is called hardness and softness, a change which is by no means a matter of choice on the part of the speaker. The two consonants must be in the same class, one of them being accommodated to the other. In the words before us, the latter is accommodated to the former, and *stag* gives *stagz*. The converse, however, *might* have been the case, and the former have been accommodated to the latter: in which case the plural of *stag* would have been *staks*. *Z*, however, seems to have been a favored sound. The plurals and genitives of words ending in vowels and liquids (where the pronunciation is optional) are all, to the *ear*, formed by the addition of *z:* for, whatever may be the spelling, *hamz, henz, hillz, barz, blowz, fliez*, etc., are the sounds we utter in pronunciation.

This is the etymological principle as applicable, or applied, to words within the pale of the same language. The English forms in *-s* well illustrate it, for they fall into two classes, the genitive (or possessive) cases originating in *-es*, and the plurals originating in *-as*. The past tenses and participles, according as they end in *t* or *d*, belong to the same system; and along with these a few other words, which, as they form smaller classes, are of less importance.

SECTION IX.

ORIGINAL INSUFFICIENCY OF LETTERS—ORTHOGRAPHIC EXPEDIENTS.

The insufficiency of letters, or the want of proportion between the number of simple single sounds for which signs are required, and the actual number of such as are found in alphabets, is one of the commonest causes of bad, or indifferent, spelling. It is the fault, or misfortune, of most languages; perhaps of all: for, though in many alphabets of comparatively recent origin the evil is reduced to a *minimum*, it can scarcely be said to be absolutely abolished: indeed, when such is the case, and when to a sufficient system of letters the merits of uniformity in their application is superadded, we have, as far as the mere analysis and representation go, a full and perfect phonetic alphabet. Even then, however, the signs or letters may be faulty. They may, for instance, be too clumsy to be written with ease, too slightly distinguished from one another to be easily read, and thirdly, so unlike each other in the general character of their structure as to present to the eye of the reader a strange and inharmonious whole when printed or written in pages. Saving however, this, and a few other minor objections, it is clear that, when we have got an alphabet which is, at one and the same time, complete in the number of its letters, and uniform in the application of them, we have nearly all that is wanted. As this, however, has never yet been found in any language wherein the orthography has been left wholly to itself, it follows that merits of the kind under notice are, pre-eminently, the characteristics of the more modern alphabets; indeed, it is only in those that have been specially, purposely, and, at the same time skilfully reformed, that they are found at all. We have the same result, of course, when, for some language hitherto unwritten, a competent constructor has succeeded in reducing it to writing. This, however, is the making, rather than the growth or development, of an alphabet.

As a fair proportion between the sounds and the signs by which they are expressed, is the prerogative of the more recent alphabets, so is the contrary the great demerit of the older ones: though the rule is by no means universal. There are old alphabets with an adequate number of sounds, and there are new ones where the want of them is miserably and mischievously great. Upon the whole, however, the difference is real. Moreover it is natural. In respect to the first alphabet,—a wonder of an invention,—it is a great thing that it existed at all. We expect that it will be incomplete. We shall soon see that it was so. Unfortunately, however, we shall also see that the deficiencies of the infancy of orthography were most insufficiently rectified as alphabets grew older; and that, when the more important alphabets of the world had attained their majority they were in a very unhealthy condition.

The natural result of this system of insufficiency is the creation of a whole series of makeshifts, or, as they are called by philologues, orthographical expedients. A few instances of this kind are enough to show how they work. A letter is wanting. This means that one sign has to do the work of two. Nothing illustrates this better than certain details in the history (and it forms a history by itself) of the letter *c*. In the French language it reigns predominant. It excludes *k* altogether. There was no *k* in Latin, and, as the French keeps up its classical traditions, there is none in the language of France. To a great extent, the rule that *c* before *e*, *i*, or *y* is pronounced as *s* is sufficiently regular and general to help the learner; though why there should be such a rule at all is not very clear. In like manner, the rule, that *c* before *a*, *o*, or *u* is sounded as *k*, is valid up to a certain point; for the sound of *s* before a broad vouel (*a*, *o*, *u*) in a word, which, etymologically, ought to be spelt with *c*, is rare. Still it occurs. To shew, then, that *c* is not *c* but *s*, we make a mark like a comma under it; which really means that we make a new letter; though not one recognised in the alphabet and in the arrangement of dictionaries. It is not *c*; which, in such cases, is *k*. It is not *s*; because it is, as a letter, a mere modification of *c*. What then is it? It is *c* in a *non*-natural sense; a makeshift; an orthographical expedient.

On the other hand, the rule that *c* before a small vowel is *s* is valid up to a certain point: for the sound of *k*, which, before a small vowel (*e*, *i*, or *y*) ought to be spelt *ke* etc., is comparatively rare. Still it occurs. But the French cannot write it. In Italian we might write it *chi*: but in French the combination *ch* is used with another power —used-up, so to say. It stands for the English *sh*; as in *charade*, *chaise*, etc. We have, then, no resource in the *h*. So the spelling is done by means of *q*+*u*; which gives us *que*, *qui*, *quillet*, etc. In Spanish, otherwise a well-spelt language, we have the same difficulty. How can a Spaniard express the sound of *k* before *i*? Not by *c*; for that has a different sound. Not by *ch*, for that, as in French, is used with another power. What, then, can the Spaniard do? He must even do as the Frenchman does—have recourse to *q*+*u*, and a very indifferent one it is.

Now the word *chimæra* is, at once, English, French, Spanish, Latin, and Greek. In the last named language it is spelt χιμαιρα, in Latin *chimæra*, in English *chimæra*, in all of which languages the *ch* is pronounced as *k*. In French it is *chimere*; where the *ch*=*sh*. But in Spanish it is pronounced as in Greek, etc,. and retains either its true sound, or a near approximation to it. Yet in Spanish it is spelt *quimera*: of all impossible spellings for a Greek, the most impossible.

Such is one out of many of the long list of orthographical expedients. How little the system favors a true etymological representation is easily seen, Yet it is out of a supposed adherence to etymology than it grew. The preference of *c* to *k* is etymological or nothing.

It will be shown in the sequel that, *mutatis mutandis*, the series of insufficient makeshifts which has been illustrated by a reference to *c* repeats itself with *g*; where in words like *rogue* the *u* is needed in order to show that the *o* is long. Write it *rog*, and the vowel runs the risk of being sounded short (*rŏg*). Write it *roag* and you disguise its Latin origin, from *rogo*. Write it *roge*, and the *g* may be sounded as *j*, or as the *ge* in *George*.

This is sufficient to show what is meant by an orthographical expedient, and how it is connected with the insufficiency of signs; or, in other words, with the incompleteness of the alphabet.

SECTION X.

WRONG CLASSIFICATION—DISTURBANCE AND CONFUSION, ETC.

To one of the three preceding heads more than three-fourths of the redundancies, deficiencies, inconsistencies, and other admitted faults of alphabets in general may be reduced. The minor faults may be noted in a more summary manner; or be indicated as they occur.

Singularity in the use of any particular letter can scarcely be blamed when we consider an alphabet as what it is when taken by itself. There is no principle generally recognised which binds the speakers and spellers of one language to use the same letters that are used by others: and still less to use them with the same power. Every alphabet must be considered on its own merits. If the Englishman chooses to use *c* where the German uses *k*, it is no fault of the alphabet of either of them. The practice of either one or the other may be peculiar, exceptional, or even eccentric. Still, this is no reason against it. It is no part of one language to suit its spelling to that of another: though, at the same time, the greater the agreement between them the better. Absolute uniformity amounts, of course, to a universal alphabet; an admirable thing in itself, but one which we must wish for rather than expect. Nevertheless, extreme eccentricity in the use of a letter is a blemish. Nor is it a very common one. *P*, *b*, *t*, *d*, *k*, *s*, *l*, *m*, *n*, *r* are used with great uniformity throughout all the alpabets of Latin origin. The Hungarian, however, though in many respects a model alphabet, stands, I believe, alone in its use of *s*. In Hungarian it stands for *sh* as in *shire*; the *s* as in *sire* being represented by *sz*.

The misconception of the relation of sounds to one another, is a more serious evil. The English stands almost alone in treating the *i* in *fine* as the long sound of the *i* in *fin*: it is, really, that of short *ee* in *feet*; whereas our long *i* represents a shortened form of the combination of *a* (as in *father*) with *y*=*ay*: the sound of the *ai* in the German word *Baiern*=Bavaria. This is, doubtless, broader than the *ei* in *meine*=*mine*, but is equally compound; a compound made out of the same elements. So, too, with the *ou*, in *noun*, etc. Its real ele-

ments are *a + u (oo)* ; or, as some say, *o + u*. In this mistaken view of the relation of certain vowels to each other, and the erroneous view as to the composition of our diphthongs, the English language is more than usually blameworthy. Then there are the faults which arise from the external relations rather than the intrinsic demerits of an orthography ; such as extraordinary accumulations of words of foreign origin, mixture of dialects, intrusion of a strange orthography, and the like. These are the elements of what we have already called the wear-and-tear of a language, and of these the English has had more than its fair proportion.

Such, with the exception of a few additional *minutiæ*, are the chief reasons why alphabets and systems of spelling (we cannot always call them orthographies, but rather the contrary,) are insufficient for the purpose for which they are naturally intended—the representation or reproduction of language. They will now be summarised, and that in the reverse order to the one in which they have been exhibited.

1. Upon wear-and-tear, in a general way there is nothing more to be said.

2. Upon the original incompleteness of the alphabet, and the want of any uniform principle in its application, thus much can be said ; namely, that it is remediable. This can be said without reservation ; and, for the purpose under notice, it is saying everything ; for it means that a palpable and notorious evil ought to be remedied.

3. The etymological principle should, perhaps, have been put in a more general form. The inordinate preponderance, however, of the etymological objection over all others, especially in reference to the influence of the quarter from which it proceeds, makes it the representative principle of its class. A little consideration, however, shows us that the system upon which we distinguish the meanings of *rite*, *right*, *write*, and *wright* by the spelling, (our object being to indicate to the eye a difference of import when the sounds are identical,) comes under the same category—only its definition must be widened. Let us say, then, that the sacrifice of pure and proper Phonetic representation, when made for either the purpose of showing the origin of a word, or manifesting the difference of import between words similarly pronounced, (the differentiation principle,) are members of a higher class, the principle of which lies in the attempt to make spelling available for secondary and illegitimate objects, or to apply it to purposes for which it is neither intended nor appropriate.

It is possible, indeed, that by exploring the whole domain of language a few instances may be found where such a secondary object may, *when not bought at the price of the sacrifice of anything else*, be worthy of consideration. The cases, however, are yet to be found, and when found, have to be considered as exceptional, and (at best) excusable.

4. The extent to which the retention of old forms in the spelling,

when they have ceased to exist in the speaking, of a language, is desirable, is the question which is the least capable of being determined off-hand. As long as change goes on, there is always a period when it is difficult to say when the change on one side ought to be adopted to meet a change on the other. Sooner or later it may be made, but the right moment is difficult to determine. Here, then, more than elsewhere, are the innovators bound to place themselves, as much as possible, in the same light as the conservators.

If these divisions be natural, it is clear that there are degrees in the validity of the objections on one side, and in the claims for alteration on the other. The completion, however, of the alphabet, and the uniformity of its application are primary and absolute necessities. The limitation of the alphabet to its true function of representing a language differs from this so slightly that the difference has only been indicated for the sake of showing that it has not been overlooked. The fixation of a fluctuating pronunciation is a matter which must be left to settle itself. It is really a question of orthoepy rather than orthography.

SECTION XI.

AN ENGLISH GOSPEL TRANSLITERATED INTO THE LANGUAGE OF THE KORAN.

With all these elements of imperfection developed in an inordinate degree, it is not strange that the art of learning to read English should be a difficult one. An Englishman, indeed, is apt to underrate its difficulties. Foreigners, however, are generally candid enough to own that, what with the multiplicity of its rules and what with the number of its irregularities, the approaches to it are, to say the least, discouraging.

As an instance of this I will lay before the reader an account of an attempt to teach it by the method of transliteration; and I will tell the story as slowly as I can, in order that, between the beginning and the end of the narrative, he may exercise his ingenuity in guessing at the explanation of it. I have never yet found anyone to whom I told it succeed in doing so.

About fifteen years ago a friend sent me a copy of one of the Gospels (John) in the ordinary English text but in Arabic characters. I took it, at first, for a mere curiosity, though without pretending to see my way to the object of it. Even a professed Arabic scholar could not have read it off-hand. Letter for letter he could have spelt it, and would thus have arrived at something like something he had heard or seen before. However, the Preface told me what this was, and what was stranger still, told me that the work was one of a real practical value; that it was meant to be useful to certain men who, so far as the Arabic language was con-

cerned, were no Arabs at all, but, on the contrary, as far as the English went, very good Englishmen ; men, indeed, of one language only, and that the English. This they spoke as their mother tongue, and they spoke nothing else. They could not, however, be taught to read it in English letters, and according to the English orthography. Put the words in Arabic characters, and they could read with pleasure and profit. I repeat it—I never found anyone who could guess who these strange English Arabs might be. Yet the explanation was simple enough. How much Mahometanism there is in the purely African and Negro parts of Africa is well known. The Mandingos and the Fulahs are more Mahometan than the men of Mecca themselves. In Bornu and Howssa the Arabic is to the native what Latin used to be to the Pole and Hungarian. It is, to them, not only the learned language, but, practically, the only written one. Those who use it are, of course, Mahometans, and where there is Mahometanism there is the Koran. And now we have only to think of the slave trade, and to turn to the Southern States of North America. Most of the negros of the plantations are pagans, and the descendants of pagans, men of many different languages and little knowledge of either reading or writing. Some, however, are either Mahometans, or of Mahometan blood ; and for these the Gospel was thus transliterated from English into Arabic, in order to secure the means of representing its pronunciation.

SECTION XII.

THE ALPHABET IN ITS EARLIEST FORMS.

Let us now ask how far we can trace the imperfection of our spelling backwards ; not, however, with an intention of giving anything like a natural history of the alphabet. This would lie beyond the scope of the present pages. Something, however, like a general view of the conditions under which the alphabets which have had the closest connection with our own were developed, may help us in the path of improvement, by showing how and when and in what directions the straight line of progress was abandoned.

The primary or primitive alphabet (the word "original" is often used in a different sense,) is generally attributed to the Phœnicians. We find it in a fuller form in the Hebrew, and hence it will often be called "Hebrew" in the present work. How are we to denominate such an alphabet? Was it an invention, or was it a discovery? Was it a mere application of something previously applied to something else? It was none of these things exclusively. The first sign, or letter, if made out of the first author's brain, and out of nothing else, was more than an invention. It was a creation. If the sign, however, existed with another import, it was an application. It is only, however, in respect of the letters themselves that

the term invention applies. The signs of the alphabet may or may not have been invented. That, however, which led to them is more akin to a discovery, and this the most important ever made. It was the discovery that conversations could be resolved into words, and words into their elementary articulations. This is the great fundamental fact in the history of the alphabet; the mere representation of these articulational elements, though a great matter, is one of only secondary importance. Out of these two elements the primitive alphabet emerged, but the former of the two is the more essential or fundamental.

The primitive alphabet, whatever else it may have been, was a combination of a marvelous symbolization subsequent to a still more marvelous analysis. The only thing to be analysed was floating conversations; for these are implied by the simple fact of the alphabet being primitive or absolutely original. So far as there was anything of the same kind antecedent to it, it was not primitive but derivational or imitative. All honor to the unknown inventor. As Carlyle says of the mysterious author of the great German poem the Nibelungen-lied, "What matters it to him or to us that the particular letters which composed his name be lost: his work remains." And the work of this our unknown analyst will remain to the end of time.

To attach to one man the full glory of having, single-handed, elaborated the whole fabric, from first to last, out of nothing, is to overwhelm a mere mortal with more than the honors of mortality. In some way or other, though we can scarcely see how, the thing grew. The analyst of spoken sentences may have been one man, the translator between the ear and the eye another. The signs may have been current with another import; may have served, for instance, to denote numbers. The analysis of sentences into words may have been done more or less completely by hieroglyphics. The further analysis of words into elements may have begun. Nevertheless, the earliest known approximation to an alphabet was a whole.

The first process was, as stated, an analysis as pure and simple as the taking to pieces of a watch. And this would begin with sentences. The resolution of these into their component words implies something like the germs of a grammar: for two words in one combination could only be treated separately, after cognisance had been taken of their separation in another. Analysis, up to this point, may exist for any length of time without leading to any scriptorial application, though without it an alphabet is scarcely possible.

The class of words with which it is the easiest to deal are the Interjections, the Numerals. the Personal Pronouns, the Affirmative and Negative Participles, inasmuch as these stand oftenest alone. The less the nouns and verbs were inflected the easier it would be. The process, too, would be easy in proportion as the language was monosyllabic, and strongly accented.

The analysis being carried to the isolation of the several elementary articulations of which the language consisted, the next step in the process was the translation of the symbols that spoke to the ear and passed away with the fleeting sound, to one which addressed the eye and was capable of being fixed. Any combination of lines and points would supply the signs by which this was to be done. How far these were quickly written, easily distinguished, or pleasantly read, was a matter of detail. If, as aforesaid, there were a set of monograms for some other purpose already in existence, the work of the alphabetographer would be facilitated.

The signs, however, for the sounds with which they corresponded (so far as the analysis was made) were either invented or transferred from some other application; and when the words which they composed were arranged in lines, the writing was from right to left; not as with us, from left to right.

Each letter had its *name—aleph* = A, *beth* = B, etc.; from these, when they became changed into the *alpha* and *beta* of the Greeks, the word "alphabet" is derived. In English we, for the most part, have no names of this kind. We merely say *bee*, *cee*, *dee*, etc.; *eff*, *aitch*, and *zed*, however, are true names—and very old ones too. They are the Hebrew *vav*, *heth*, and *tsaddi* respectively. The principle upon which these names were given has been a matter of speculation. Some have held that certain letters were named after certain objects, from their shapes resembling them; others that the name was taken from objects which themselves had a name beginning with the letters under consideration. Thus, *beth* was called *beth* because it was like a house (*beth*), or it was so called because the name for *house* began with *b*. In the history of the adoption of alphabets these speculations have their value; their bearing, however, on its origin is of the slightest. It is one thing for a child to be born, another for it to be named. When were these names given? Almost certainly before the application of the Phœnician alphabet to the Greek, inasmuch as, in the two languages, they are essentially the same.

The arrangement of these names, as we find them in dictionaries, gives the *order* of the alphabet. It is not accidental. It has the appearance of being both regular and scientific; but it is, also, so artificial that it requires some attention to understand it; and even then it is by no means square and clear. It can be illustrated, however, by our own A, B, C as well as by the Hebrew or Greek. Let us take the vowels first. Instead of coming together, they are found at intervals; *a* at the beginning, *u* nearly at the end of the alphabet; *e*, *i*, and *o* in the intermediate part of the series but not in contact with one another. There is something like regularity in the distances between them. After noting this let us look at the classification of the consonants: premising that only those letters will be noticed which are common to our own language and the Hebrew. This is not the scientific method. It is, however, convenient; and

for the object in hand, namely, the proof that the arrangement is systematic rather than arbitrary, sufficient. *B*, *f*, *p*, and *v* are allied letters; members of the same class; in the language of the Eton Greek Grammar *inter se cognatæ*. So are *k*, (*c*), and *g*, and with its origin power, *q*. So are *d* and *t*. Let us call the class represented by *b*, etc. number one; that represented by *k*, etc. number two; that represented by *d* and *t* number three. Now it may be found by simple inspection that the members of each class stand in the same relation of succession to each other and to the vowel. Thus:—

A ... vowel	E ... vowel	I ... vowel	O ... vowel
B ... class 1	F ... class 1	. . . .	P ... class 1
C ... „ 2	G ... „ 2	K ... class 2	Q ... „ 2
D ... „ 3	. . . .	. . . .	T ... „ 3

with *t* the Hebrew alphabet ended. The first of these quaternions, (*c* being treated as *k*), is clear and definite; the other three are irregular; the third being greatly interfered with by the liquids *l*, *m*, and *n*; and the fourth by *r* and *s*. The relation, however, *as far as it goes*, is absolute. It may be said that it does not go far, which is granted. It is only submitted that it goes farther than mere accident would carry it. The date of this runs back, at least, as far as the adoption of the names of the letters by the Greeks.

We now know what to call the alphabet. It is the result of a very complex series of processes and operations. The analysis of sentences into words, and of words into syllables, and so on, is a great thing; but greater still—humanly speaking a wonderful instinct or intuition of genius, or, speaking the language suited to the thoughts of a higher sphere, an inspiration—is the conception that such an analysis was possible. Then comes the translation of the signs addressed to one sense into signs addressed to another; the process by which we speak to the eye and the process by which we write to the ear. To this, observation has mainly been subservient. For the particular signs, so far as such or such a letter was formed out of a new combination of lines and points, limited on every side by the conditions of reading and writing, invention was required; and that of the highest kind; and even when signs previously in use for other purposes were made available for a new purpose, acumen, tact, and judgement were demanded. How far all these conditions were complied with, or anticipated, by a single individual we shall never know. All that is here indicated is the complex nature of such an alphabet as has just been described. There is the great idea of the possibility of an analysis, and a representation. There are details of the analysis, and the details of the representative signs. There is the naming of them, and the arrangement of them. The alphabet, then, in its full form, is a system, a structure, a *construction*.

The only element in this construction to which we clearly see our way is the order of the letters. These served a double purpose. The letters were, in Hebrew and Greek, numerals as well. Why *a*

should precede *b* we cannot say. Why *a* should stand for 1, and *b* for 2 we cannot say. But, given the fact that such were their original powers as numerals, the order in which they stand is transparently intelligible.

SECTION XIII.

IS THERE MORE THAN ONE PRIMITIVE ALPHABET?

The process by which an alphabet is constructed has now been exhibited. Taking it *as a whole*, was it ever repeated? Was there ever a second alphabet invented, discovered, developed or constructed; equally primary, primitive, original, and independent with the one which has just been investigated? I think not. I think that the conception of decomposing the complex combinations of spoken sounds into their elements, and fixing them by visible signs, never entered into the head of any one but the original discoverer, except so far as he learned from others that the thing could be done, and (to some extent) the way of doing it. That men of genius have effected great things of the same kind is not denied. It is only suggested that they had some previous knowledge of the processes required for the result. There is, for instance, the Cherokee alphabet, of which more will be said in the sequel. There is the language called Vei, the alphabet of which has attracted a fair amount of attention. The "Vei Phonetic" appeared a few years back on the title-page of a volume of Travels; as a rival of the "Fœnetik Nuz" in respect to mystery of its import. "Vei," however, is the name of a dialect of the Mandingo language, spoken on the north-west coast of Africa, which enjoys the prerogative of having a native alphabet. The originator of it, himself a native, is, perhaps, still alive. The details of what he did have been stated on fair authority. He knew that white people could write, and he framed an alphabet for his countrymen. Hence, whether he could himself write or not, he had seen writing, had been the bearer of letters, and had admired the mystery of their import. I know of no nearer approach to invention than this. Nevertheless, I deny that this is the invention of writing. It wants the great element of independence; the self-born conception, without any precedent to guide it, of translating one kind of sign into another. This independent conception of a possible end, even more than the acumen displayed in the details of the instrument, constitutes in my mind the true basis of the construction of an alphabet.

In asking what alphabets have the best claim to an independent origin, we must eliminate those which are other than alphabetic in the ordinary sense of the term: and this means the Chinese, and the old Egyptian or Hieroglyphic.

With this limitation, those for which, either directly or indirectly, an origin other than Phœnician, has been claimed are—

1, 2. The Corean, and Japanese.

3-10. A remarkable group applied to certain languages of the Malay family; used either in time back or at present in the Philippine Islands, in Celebes, in Lombok, and (to the number of three) in the island of Sumatra.

11. Those of Southern India.

12. Those of Northern India.

These, it may be seen, are all found within the same geographical area, the South-Eastern division of Asia. They all originally belonged to the languages of either the Buddhist or the Brahminic religions. The Corean, the Japanese, and the alphabets of India do so still. Those, however, of the Malay group have a history of their own. They are sufficiently like each other to pass, with most critics, for members of a single family. The opposite view, however, has been taken; and the extreme opinion that they are all of independent origin has had its upholders; of which the most influential was one of our best Malay scholars, the late Mr Crawfurd. They are very unlike all other alphabets: and can be connected with those of India only by the assumption of an inordinate amount of alteration. When we bear in mind the language to which they applied; the rudeness of the tribes which used them; and, above all, the nature of the material on which they were written, (or sometimes, as on the stem of the bamboo, scratched or scraped,) this assumption is, in the mind of the present writer, legitimate. Still it is a point on which opinions differ. Be this, however, as it may; they have all dropped their connection with the religion through which they were introduced,—the Brahminism of India. The Battas of Sumatra have relapsed into something like their primitive paganism. Still they preserve their alphabet: and, as they are man-eaters, the combination of literature with cannibalism is remarkable. The three other Sumatran alphabets, those of the Rejang, Korinchi, and Lampong dialects, are used by a Mahometan population; so that they have the Arabic alphabet of the Koran to contend with: and to this they will probably give way altogether. In the Philippines, the dominant alphabet is that of the Spanish missionaries. In Lombok the literature seems to have always been as scanty as it is at present. The creed, however, is Mahometan, and the ordinary alphabet Arabic. In Celebes, however, though the creed is Mahometan, the native alphabet is still in use. It is written. More than this, it is printed.

This is as much as need here be said about them. Whatever may be their claims to an independent origin, they have no connection with our present investigation. Some, indeed, of our readers may possibly think that in the question of phonetic spelling for England we need not go so far as even Phœnicia. It is only certain that we need not go no farther.

SECTION XIV.

CAPITAL AND SMALL LETTERS—MONUMENTAL, CURSIVE, AND PRINTED STYLES.

The original Phœnician alphabet, in its Hebrew form, though it gives us the germ and principles of all the alphabets derived from it, by no means gives us a notion of the changes which each letter was destined to undergo, in its transfer from country to country and from language to language. These, in many cases, end in absolute transformations. The history of them, however, is but imperfectly understood; the little that is actually known being known only of the earliest and the latest forms—or the two extremes. We know thoroughly the difference between the small letters and the capitals, and we know the difference between writing and printing, for these belong to our own times, We have also a fair knowledge of the early alphabet as it occurs in inscriptions. We know, in short, the alphabet of inscriptions and coins, the Lapidary alphabet, and the Numismatic alphabet; and we know that this was an alphabet of capital letters. But of the early Cursive alphabet for parchment or paper, we know but little. That the capitals took forms approaching those of the small or cursive ones, we know in certain particular cases. But all these are of a comparatively late date. And so it is when we come to the middle of the fifteenth century. We know how, when printing was invented, the cursive alphabet became an alphabet of stamps.

The difference, however, between capital and small letters was developed during the interval; only, however, in certain alphabets. In the printed Hebrew, and the printed Russian, all the letters are still capitals. In the Arabic they are all small, or cursive. Except then in the cases where either the capital or the small letter is predominant, there are, virtually, two alphabets—determined by the differences of the material for which they were intended, though, so far as they were of the same origin, only one.

And this difference of material is important. For incision we want straight lines and angles; for writing we want curves: whereas, for printing we can use both. A cursive letter, then, is something more than a capital of lesser growth; and, though the distinction need not always be acted on in the coinage of new letters, its existence must be recognised.

So much for the *two* alphabets, the small, (or cursive,) and the capital; and their connection with ordinary writing on the one side, and with coins and inscriptions on the other. When printing, however, was invented, these *two* became *four*, and every letter had four forms; a capital and a small one for the typefounder, and a capital and a small one for the penman.

SECTION XV.

THE PHONETIC AS OPPOSED TO THE ETYMOLOGICAL PRINCIPLE.

There is another point upon which a remark may now be made. The alphabet more especially under notice, that employed in the *Phonetic Journal* by Mr Pitman is, in every sense of the word, Phonetic. As such it stands in contrast with the present incomplete alphabet with its corresponding faulty orthography. It is phonetic from first to last. It limits letters to the representation of sounds; to this and nothing else. Secondary objects, such as the suggestion of the etymological history of a word, as the differentiation of the meanings of words sounded alike, (with, however, a few exceptions, as *in, no* = "*in, nɔ*," and *inn, know* = *ín, nó*) and as the fixation of the language, it utterly ignores. It not only ignores all this, but it goes to the length of doing away with all that has already been attempted in any of these directions, or with any of these intentions. To use a favorite expression of Sir William Hamilton's, it is "Thorough-going." As compared, then with the existing orthography it is phonetic in the highest degree, and the ordinary system is its opposite. Nevertheless, it does not follow that the ordinary system, notwithstanding this opposition, is wholly wanting in phonetic elements. It has them to a great extent; indeed no alphabet, and no orthography can exist without a phonetic element as its basis. It is only when they are so far warped by other influences as to become something different from that for which they were originally intended, that the opposition suggested by the word in its present sense becomes real. The Phonetic Principle is one thing: a Phonetic System of Spelling, consisting of an alphabet and its corresponding orthography, is another: and, in the forthcoming pages, the former—the Phonetic Principle—will mean the limitation of spelling to the representation of sounds only, and the exclusion of all secondary objects: generally, however, with special reference to the principle to which it is the most opposed—the Etymological or Historical Principle.

SECTION XVI.

ALPHABETS UNDOUBTEDLY DERIVED FROM THE PHŒNICIAN.

(a) THE EASTERN OR ASIATIC GROUP.

1. The Phœnician Alphabet itself is known only through coins and inscriptions; the great part of which are Punic rather than Phœnician, in the geographical sense of the word. *Punic* was another name for *Phœnician*, and Carthage was a Phœnician colony. Africa and Spain are the countries where Punic remains most abound. A specimen of the language of Carthage occurs in a play of the Latin comic writer, Plautus; where one of the characters, *Pœnulus*, or the

Little Carthaginian, speaks the language of the country. The writing, however, is Latin. The Phœnician alphabet, then, so far as we know it, is known only in respect to its capital letters.

2. The Samaritan alphabet, also, is written in capitals only. This is the alphabet of the famous copy of the Pentateuch; which is Hebrew in language and Samaritan in spelling. The so-called Samaritan Chronicle is, like the Pentateuch, in respect to its letters, Samaritan; though Arabic in language. This means that the Samaritan has obtained its original Lapidary character for more than a thousand years at least. It gives us the nearest approach to the original primitive alphabet of any alphabet at present in use.

3. The Hebrew of the Old Testament, although the alphabet of which the most is known, is, by no means, in respect to the shape of the letters, a good representative of the original. Yet it consists of capitals only. They are not, however, of the sort required for inscriptions. They are meant for writing. Nevertheless, they are wholly deficient in the cursive character. This is, doubtless, because they were not meant to be written as ordinary letters; but as Holy Scriptures. There is a boldness in their lines, and a squareness in their outline which has given them the name of the Quadrate Character. Written, or almost drawn, with a pious patience and observant care, they undergo but little change so long as they remain the letters of the holy text. As the Chaldee of the later writers, and a secular literature, they lose their massive regularity, and become more or less cursive. Still, in printing, there is but one sort of letter—the Capital.

Such is the Hebrew alphabet when written with the original twenty-two letters and no more. How inadequate this was to the representation of the vowel sounds has been already stated. This evil, however, is remedied in what is called the Masoretic text of the Old Testament. Here we have a full representation of the vowels: and, in the strict sense of the term, every sign thus superadded is a new letter. The Masoretic signs, however, of the vowels are not letters in the ordinary acceptation of the term. They are marks consisting of either short lines (– ᵀ), or dots (: ∵ ⁖) written over or under the consonants with which they combine; and as such are adjuncts or appendages, rather than true letters. Another use of the dot was to add it to certain consonants wherein two closely allied sounds had only one sign. These were true diacritical marks. The vowel-signs were something more. In the orthography of the class of languages now before us both play an important part. The Hebrew, with its direct derivatives, is the alphabet of Judaism.

4. The Syriac is, pre-eminently, the alphabet of Christianity—early Eastern Christianity. With the same framework of twenty-two consonants it has the same system of superadded vowels. These, however, are only three in number, and are borrowed from the Greek. There is no distinction between the small letters and the capitals in

writing; all the letters being small. In inscriptions, however, they are all capital, and that of an archaic character, that is, they approach the Phœnician. From the Syriac of the Nestorian missionaries we get the Uighur, or alphabet of the Turks of Central Asia; before their conversion to Christianity: and from this the Mongol, and from the Mongol the Mantshu. These two represent the languages of Buddhism, and are the most outlying, eccentric, or metamorphic of all the members of the class. All the letters are small; the lines run neither from right nor left, to from left to right, but from the top of the page to the bottom.

In the South-East where existed the pagan civilisation of the fire-worshippers of the Euphrates, the Tigris and the Syrian Desert, the alphabet, best represented by the inscriptions of Palmyra, gave origin to that of the Persians anterior to their conversion to Mahometanism. This is, at the present time, the alphabet of the Parsees.

5. In the Arabic, the alphabet of the Koran, the present Persian, Turkish, Hindostani, and Malay languages are written; all having, previous to the introduction of Mahometanism, been written in proper alphabets of their own. The Arabic, a growth out of an early form of the Syriac, is formed wholly for writing; the lapidary or inscription character being at a *minimum*. All the letters are small rather than capital, and as much as possible they are made to run into one another. Hence, most of them have three forms; one for the beginning, one for the middle, and one for the end of a word. The vowels, when written at all, are inserted, or rather superadded, on the Syriac principle. The fundamental consonants are few in number, indeed only the original twenty-two of the Hebrew alphabet. Hence, there is a necessity for diacritical dots.

6. The Abyssinian alphabet stands alone in its class. It is the alphabet of a so-called Christian country. It is written from left to right. Finally, it is a syllabarium rather than a series of simple signs for simple sounds.

SECTION XVII.

ALPHABETS UNDOUBTEDLY DERIVED FROM THE PHŒNICIAN.

(*b*) THE WESTERN OR EUROPEAN GROUP. THE GREEK AND ITS DERIVATIVES.

Whatever may been the number of elementary sounds in the Phœnician language, it was greater than that of the letters. The alphabet, then, was inadequate to the demands of the language for which it was constructed. Much more would it be so for a strange one. Fortunately, when extended to Greece, it fell into the hands of such a nation as the Greeks, for they had pre-eminently the capacity of improving, developing, and adorning whatever they touched.

With the Phœnician they agreed:—

a. In keeping the *order* of the letters.

b. In keeping their *names*.

Thus far, then, the Greeks were conservative: and no harm was done by their conservatism. Much good, on the other hand, was done by their innovations. The results of these were that, when the Greek alphabet became a model for others, it had the following form, and was applied to the language on the following principles:

1. Its letters in writing ran from the left to right. The Hebrew writing was from right to left.

2. Its capital letters were clearly distinguished from the small ones, and *vice versâ*. In some cases there was a mere rounding or softening down of an angle: so that a letter, previously fitted for inscriptions, became adapted for cursive writing. In others, the change amounted to the formation of a new letter.

3. Signs which were not wanted had disappeared, so that three letters which belonged to Hebrew, and which were at first adopted by the Greeks, no longer found a place in their alphabet. These were

(*a*) The Hebrew *vau*, or *vaf*, with the power of *v* or *w*. It was the sixth letter in both the Hebrew and the Greek alphabets, and, in the latter, when it ceased to be used as a *letter*, it was retained as a *numeral* = 6. It was called the *Di*gamma, being, in form, like two *gammas*, one on the top of the other. As the Romans retained it, it still keeps its place in the alphabets of Latin origin, with a change of power and form; in other words, it is the Digamma which is the origin of our own letter *f*, its name *ef* being from the original *vav*.

(*b*) The Hebrew *kof*, *koph*, *quof*, or *quoph*. This, also, from having been retained by the Romans, has become the English *q*.

(*c*) The history of the letter known as the Doric *san* is more complex. Word for word, it seems to be the Hebrew *sin*, which is the name of the ordinary *s*, its place being between *r* and *t*. The Greek letter, however, which has this place and power is not called *san* but *sigma*, which seems to be, word for word, the Hebrew *samech*. *Samech*, however, is the name of another letter, one which has its place between *n (nun)* and *o (ayn)*, and which, in Greek, so far as its place is concerned, is represented by *xi* (Ξ ξ). This *samech*, which in the Greek alphabet is thus transformed, seems, in the Latin to have been, *at first*, either rejected or allowed to become obsolete—*afterwards*, however, to have been admitted; its place, however, was at the end of the alphabet, where it now does duty as *x*.

4. A fourth letter underwent a more important change than any of the preceding. In the Hebrew alphabet it stood eighth. If we count the Digamma, it stands eighth in the Greek as well. Eighth, also, it is in the Latin, in the English, and, probably, in all alphabets of Latin origin. Its Hebrew name is *heth*, its English *aitch*, the two being, as word and word, the same. Now, whatever may have been the exact sound of this Hebrew *heth*, it is universally admitted to have been one akin to that of the modern *h*, that is, a breathing, an aspiration, or the like; or, if not this exactly, some

such sound as the German *ch*, at any rate a sound of the *k*, *g*, *h* series. The name of this letter the Greek converted into *hēta;* its shape they put into the form of the present H, but its sound, or power, they absolutely transformed. The Greek (H η) is a vowel; the *ee* in *feet*, or the long sound of the Epsilon (E ε) or *e* in *fen*. On this change from a consonantal or semi-consonantal, to an undoubtedly vocalic sound, more will be said hereafter; inasmuch as *heth* was not the only letter thus transmuted.

5. But there is a further innovation connected with this same *heth*. As a *letter* under the name of *hēta* it did, for the Greeks, the work of a vowel. What, however, did it do in its capacity of an aspiration or breathing, or as the origin of the Latin *h?* It became a mark. Perhaps we may call it a diacritical mark. At any rate it became an appendage to a letter rather than the body of the letter itself. As an appendage, its proper place was before the vowels: and the vowel *upsilon* (Υ υ) was *always* preceded by it. Moreover, with a slight extension of its powers, it became a regular concomitant of consonant *r*, just as if, in English, we never wrote *ra* or *re*, etc.. but always *rha* or *rhe*. There can be but little doubt that, here, it denotes a vibration of the tongue rather than a simple breathing. Now, with the power of an *h*, this sign (ʻ) was, to a great extent, a letter also. It was, doubtless, very abnormal and exceptional in its form. Nevertheless, there is nothing in the conception of either a letter or an alphabet which prevents any two signs being of different sizes: though, at the same time, every alphabet requires some approach to symmetry. Still, (ʻ) never passed for a letter in Greece; because, as the letters were numerals also, a disturbance in the order would have been the result.

That it was amply sufficient for the purpose it was meant for is evident. Practically, a vowel is either preceded by a breathing or it is not; so that when once we have a sign for the presence of one we have no need of a second in order to denote its absence. Upon this principle, the (ʻ) itself might have been dispensed with; for a mark attached to the vowel of the non-aspirated division would have made it unnecessary.

6. The Greeks, however, thought otherwise, the result being that a second mark of the same kind was adopted. This was the same comma-shaped prefix with its tail turned. *Hagios* was written ἁγιος; and *ago* appeared as ἀγω. Unwilling as we may be to impute error to the Greek orthographists, we can scarcely commend this superfluity of signs indicative of *h* and no *h*.

7. The Greeks saw, or seem to have seen, the true nature of the sounds of the *ph* in *Philip*, the *th* in *thick*, and the *ch (kh)* in the German *auch*, *noch*, etc. We call them Aspirates, and as an aspirate is a breathing, and as a breathing is represented by *h*, and as the three sounds are, respectively, connected with *p*, *t*, and *k*, we see nothing wrong in writing them as if they were *p* + *h*, *t* + *h*, and *k* + *h*: an egregious blunder which we may lay to the charge of the

Latin alphabet, as may be seen ere long. And this is why I say that the Greeks "saw, or *seemed to have seen*, the true nature," etc. Of the *h* they saw nothing at all. Of its equivalent the ' they saw a good deal. But whether they saw that π + ' was *not* φ (the sign for *f*) is doubtful. What they really saw of this supposed aspiration which converted the sound of *p* into that of *f*, etc., was just nothing at all. And this was the very best thing that could be seen. They corrected no blunder. They rose above no confusion. They simply formed their alphabet before either blunder or confusion had taken birth.

8. They recognised the principle of compendiums; for they wrote Ξ ξ and Ψ ψ for *ks* and *ps*. The two signs, however, are not in the same class. Ξ ξ belongs to the main body of the alphabet, for it stands in the place of the Hebrew *samech*, between *omikron* or *ayn*. Ψ, relegated to the end of the alphabet, was a later addition.

9. Their crowning merit, however, was that, in the case of *e* and *o* they drew a distinction between the long and the short vowel: and well had it been had they gone further in this direction. As it is, the differences between the long and short *a*, *ι*, and *υ*, are unexpressed.

11. For expressing the shortness of a vowel of doubtful length or quantity they doubled the consonant that followed, *Thalassa* or *θαλασσα=sea.*

11. The last great change made on the original alphabet by the Greeks, is, perhaps, one which outweighs all the other improvements. It has already been foreshadowed, but due prominence must now be given to it. Whatever may have been the actual sounds of the Hebrew vowels out of which *a*, *e*, *i*, *o*, and *u* originated, they were not decidedly and universally vocalic. They were rather breathings, gutturals with the character of an exaggerated breathing, or nasals. They were, perhaps, as much consonantal as vocalic. At any rate, we have seen that in the Hebrew Bible for ordinary reading they have the signs of the true and genuine vowel superadded. Whatever may have been its nature, there was a shortcoming in the orthography in this respect which needed amendment; and this the Greeks made. The *heth*, which they converted into an unequivocal long *e*, is with us *h*. The other vowels, however, have preserved their character, and that to the infinite benefit of mankind.

The Greeks have certainly done great things in the history of the alphabet. The incidental errors such as that of the Ψ, the two breathings, and the expression of the shortness of the preceding vowel by the doubling of the consonant by which it is followed, are venial offences. The elimination of useless letters, the partial completion of the alphabet by the formation of new letters, and above all, the unequivocal character given to the vowels are great and unmixed benefits.

It is almost invidious to ask what they did *not* do: nor, with our imperfect knowledge of the more minute details of their system of

sounds can ~~be~~ we say with certainty how much or how little they neglected, This, however is certain that, if the vowel *o* had a third power, if *a i* or *u* had a second, if the language contained the sounds of *v*, of the *th* in *thine*, of *gh ;* of the *sh* in *shine*, or of the *z* in *azure*, (and some of them, it doubtless, had) they constructed no signs by which they might be expressed. Thus far, then, and no farther, go their sins of either commission or omission.

Let due attention be paid to the four letters Ω ω, Φ φ, Χ χ, Ψ ψ. They are the first instances, in any derived alphabet, of any new character.(2)

Number.	*Greek Letter.*	*Greek Name.*	*Hebrew Letter.*	*Hebrew Name.*
1	α′	Alpha	א	Aleph (Alef)
2	β′	Beta	ב	Beth

2. Without the mark (′) these signs are letters; with it, numerals.

The first language to which the Greek alphabet was extended was the *Coptic* or *Egyptian*; the Coptic being the oldest language of Greek origin. It consists of thirty-one letters, of which the first twenty-four are Greek both in shape and name—*Alpha, Bita, Gamma, Dalda,* etc. In respect to their power as numerals there is a curious change. The Greek sign for 90 was the letter which corresponded with the Hebrew *Qof*, that is, *Koppa*; but this, as the sign of a sound, was obsolete in the Greek. The Egyptians, then, who only adopted the true letters had no numeral for 90. So they expressed it by the *second* of their additional ones, that is, by the twenty-sixth, thus throwing the agreement between their letters and numerals out of form. It was as if in English we counted thus

Letter	15	...	O=70	
„	16	...	P=80	
	...	...	Q	(Supposed to be wanting.)
„	17	...	R=100	
„	18	...	S=200	
„	19	...	T=300	
„	20	...	U=400	
„	21	...	V=500	
„	22	...	W=600	
	...	...	X	(Supposed to be wanting.)
„	23	...	Y=700	
„	24	...	Z=800	
„	25	...	... ...	(In Coptic, no numeral power at all.)
„	26	...	... 90	

The remaining signs having no numerical power at all, there is no letter expressive of 900. There *was* one in Greek: but like the sign for 90 it had dropped out of the alphabet *as a letter* before it was introduced into the Egyptian. This is the only clue we have as to the date of the Coptic alphabet. The two languages came in contact with one another as early as the seventh century B.C., when Cyrene was colonized by the Greeks. The only compositions however, which have come down to us are subsequent to the introduction of Christianity.

The second alphabet formed after the model of the Greek was the *Armenian*: yet, if we look at the shape of the letters only we see no signs of the connexion. They are not Greek. They have no resemblance to the Greek. They have no resemblance to anything of Greek extraction. Sign for sign, they are as unlike those of Greece as the Greek letters are unlike the Sanskrit. They are thirty-six in number. Their names, however, are of Greek origin; and these, along with the circumstances connected with their history, point to Greece. Besides which, they are equally unlike anything else. If so, the system is that of an absolute metamorphosis or transmutation; so complete as to exclude the very notion of identity. Yet the Greek origin of the Armenian alphabet is universally admitted.

These thirty-six letters are evidently the construction of a single

workman; and he who made the signs, probably effected the analysis of the language to which they applied. But the great difficulty in doing this, as is abundantly shown by our numerous missionary alphabets, is only wonderful when it is done for the first time. Its great element is the conception that such a thing is possible. As for the letters themselves we can only say, when we look at them, that such a man as the constructor of the Armenian alphabet is just the very one that is now wanted: the man who would meet and rebut and perhaps anticipate, what Mr Ellis calls the *strange-appearance objection*. It is certain, however, that he would disappoint our expectation.

Miesrob, for that is the name of this Armenian Cadmus, had he an alphabet like the English to deal with, would probably have failed in constructing a single letter; for he would have had to make it in harmony with those already made. It is possible that, individually, I exaggerate the difficulty of doing so. At any rate, I feel sure that Miesrob felt it. The whole to him seems to have been easier than the part. What, then, did he do? He made a whole alphabet of thirty-six letters at once; and I firmly believe that, in so doing, he found his work comparatively easy.

The *Georgian* alphabet, letter for letter, is as unlike the Armenian as the Armenian is unlike the Greek; yet it is the Armenian on which it is founded. It has the same number of letters, for nearly the same sounds. In shape, however, the letters are curvilinear, whereas the Armenian are angular. Like the Armenian, it seems to be the work of a single constructor. These two alphabets, so far as the number and the adequacy of their letters are concerned, are two of the best in existence. The Armenian, however, is very trying to the eye; the interspaces between the lines that form the letters being but little wider than the lines themselves. Of late, the Georgian has been used by the Russian philologues in their alphabets for the numerous, hitherto, unwritten languages of Caucasus. These abound in strange gutturals and sibilants; and when the ordinary letters and diacritical marks are exhausted, recourse is had to the Georgian.

We now come to the alphabets of the *Slavonic* languages. Where the creed is that of the Eastern Church—the Greek Church as it is often called—the alphabet is of Greek origin. Such are the Cyrillian and the Glagolitic. The first belongs to the Servian and Bulgarian languages; the construction of which is attributed to the missionary Cyrillus in the seventh century, and is the foundation of the Russian. The second is, at present, obsolete: since the dialects to which it applied, those of Dalmatia, Carinthia, and the Slavonic districts of the old Roman province of Illyricum, are Roman Catholic.

The Slavonic alphabets of Greek origin are formed upon the capital rather than the small letters, and are by no means so pleasant to read as the Greek itself. On the other hand they are all

formed on the principle of new signs for new sounds: so that they rank among the best for completeness. Notwithstanding this, the Greek alphabet itself has not been adapted to the changes which several of its letters have undergone. Thus the Beta and Delta have long been sounded as *v* and *dh*, (that is, as the *th* in *thine*): yet for *b* and *d*, when they occur in words of foreign origin, there are no better signs in modern Greek than Μβ, and Ντ. Again, certain vowels and diphthongs have merged their originally independent powers into that of the *ee* in *feet*; nevertheless, the full number is still kept up. Hence, though we know how to sound a word when we read it, we doubt as to the spelling of it when heard.

The Greek alphabet, with diacritical marks, is extended to the language of Albania.

In like manner, the Servian is used for the language of the Danubian Principalities; a language of Latin origin. Of the Mœso-gothic notice will be taken hereafter.

SECTION XVIII.

GENERAL VIEW OF THE FOUR CLASSES OF ALPHABETS— THE PHŒNICIAN GROUP.

We may now look back and take a general view of the three primary classes into which the alphabets of the world are reducible; and, at the same time, by anticipating, take notice of the fourth; though, as this last is the one which bears exclusively and directly on our subject, the full understanding will be best got from the working of it. To appreciate, however, its relations to the other three, something must be said about it now.

The characteristics of the Phœnician family are palpably conspicuous. It is only in this class that we find, after their earliest infancy, the system of writing from left to right. Here, too, and here only, occurs the still more eccentric practice of writing vertically, or from the top to the bottom of the page. Here, too, do we find oftener than elsewhere alphabets consisting of capitals only, or of small letters only. Here, also, we find the earliest syllabarium: at any time a rare form. Above all, here it is where we find an alphabet originally consisting of consonants, or imperfect vowels only, and, as a result of this, the whole system of vowels delegated to a system of supplementary (we must not call them diacritical) marks,—points, dots, or what not. The details of this system are admirably given in the Masoretic text of the Hebrew Bible; indeed they have never been given better or so well. But their merits are more than counterbalanced by the mere fact of their being supplementary. They are no integral parts of the system of writing. They can be, and are dispensed with. In the derivative alphabets only, a few of them are retained. In fact, the recognition of the paramount importance of the vowels is exceptional throughout

the whole Phœnician family or group. The original defect of the alphabet, which was, at once, consonantal and incomplete even in its consonantality, seems never, except in one exceptional instance, which will be noticed hereafter, to have been remedied: for, though, as in the Arabic, the number of letters may be nearly doubled, there is no thoroughly new sign. One old one is made into two or more new ones, new ones by diacritical marks; and these are so much part and parcels of the several letters to which they appertain that they can scarcely be called diacritical.

SECTION XIX.

GENERAL VIEW OF THE GREEK GROUP.

There is no comparison between the Greek and the Phœnician in respect to the number of secondary alphabets to which they have given origin; nor yet in respect to the geographical area over which they have spread. The single fact of the Arabic being the alphabet of the Koran, has extended its domain from the Straits of Gibraltar to Sumatra; has carried it, as the medium of the Hindostani language, into the very heart of India; and, as that of the Turkish, into the South-eastern parts of Europe. The only language that has a tendency to increase in area, to which an alphabet of Greek origin has been applied, is the Russian; and this is, doubtless, an important one. The Coptic language is no longer a spoken one; while the Georgian, the Armenian, and the Albanian are spoken over small areas only.

The difference in respect to the figures of the letters in the different languages of this group is great. The Coptic makes the nearest approach to the original. The Georgian and the Armenian recede the farthest from it.

It is the Greek group in which the most new signs have been constructed; we may say, indeed, that it is here, and here only, that freedom has been the rule, and restriction the exception. So it was when the modern Russian, the latest member of the class, was constructed; so it was when the signs Υ *υ*, Φ *φ*, Χ *χ*, Ψ *ψ*, and Ω *ω* were added to the primitive Phœnician. So, too, it was when the distinction between the long and short *e's* and *o's* was first indicated.

SECTION XX.

GENERAL VIEW, ETC.—THE ALPHABET CONCERNING THE ORIGIN OF WHICH OPINION IS DIVIDED.

The class, in so far as it is characterized by a negative element, is convenient rather than natural. Neither is it, for the present question, important. The alphabets which belong to it are mainly connected with the Brahminic and Buddhist religions; the Sanskrit and the Pali being the chief of them.

They are old; the earliest application of an alphabet of the class dating from B.C. 280.(3)

With the alphabets of Latin origin, or those of the class to which our own belongs, they have no direct relation: except so far as the transliteration of the languages of India is a matter of importance to the rulers of India. With those of Greek and Phœnician origin the relations are closer. The Zend and Pehlevi, or Huzvaresh, the alphabets of the Parsee religions are so Sanskritic in respect to their vowel-system as to invest them with a character at variance with that of the class to which they belong, or the Phœnician.

The Sanskrit is the only language of this class which will again be referred to.

SECTION XXI.

GENERAL VIEW, ETC., ALPHABETS OF LATIN ORIGIN.

The alphabets of Latin origin are simply the Latin alphabet itself, with certain omissions and modifications; for genuine additions there are none. The diphthongs "æ" and "œ" are the nearest approaches to a new letter; but they are only approaches. The cedillac "ç" and other variations of figure are the same. Of these, however, and the like of them, along with diacritical and other marks, there is an abundance.

They are, in respect to their geographical distribution, the alphabets of Western Europe; but this means the Europe of the Western division of the Roman Empire, which again means the Europe of which the Christianity is that of the Western Church. In this we have the reason of their uniformity. They were extended from one language to another on a system, and under similar conditions; the influence being in most, perhaps in all cases, that of the Church. In writing then, we of course, take no cognizance of those languages and countries to which the extension of this alphabet is of wholly recent date; the cases which here present themselves being mere details in the history of some modern language, Spanish, French, Dutch, or English, as the case may be.

The languages which are thus represented belong to the following families—

1. The Latin itself—these being the Italian, the Spanish, the Portugese, and the French; and, of less importance, the Provençal and the Romane (Rumonsch) of the Grison districts of Switzerland. The Rumany of the Danubian Principalities belongs to this group. Its alphabet, however, is of Servian; that is, of Greek, origin. An attempt to change it for a modified form of the Latin is going on at the present moment; indeed it is in the Danubian Principalities

3. For the alphabet and the coins of this period in the north of Persia and the north-western parts of India, the reader is referred to Wilson's "Ariana Antiqua."

that the greatest experiments connected with phonetic spelling is going on. At the same time, it is an experiment in Transliteration, or Metagraphy, rather than in pure Phoneticism.

2. The British and Irish Gaelic of the Keltic class.

3. The German, Dutch, English, and Scandinavian forms of speech; the class to which they belong being the Teutonic.

4. The languages of the Roman Catholic populations of the Slavonic family, that is, the Bohemians, the Poles, the Carinthians and Dalmatians, etc.

5. The Lett and Lithuanic of Livonia, Curland, and Lithuania.

6. The Magyar language of Hungary; the word *Magyar* meaning *Hungarian* in the most limited sense of the term. The languages of Hungary, if we use the word in either its geographical or its political sense, are, taken collectively, other than Magyar: and so are the alphabets. Thus the Slovak of the North West is Tshek, or Bohemian, in respect to its writing, and nearly so in respect to its spoken language; in other words it is a provincial form of speech of which the Bohemian is the standard. On the North East the Ruthenians, whose language is that of Little Russia are numerous. On the South East there is a strong Servian element; while, in Croatia the language is akin to that of Dalmatia, and, when it is written at all, written like the Dalmatian and the Carinthian. Besides these, there is the German of the towns, and the Wallachian of the country districts of Transylvania. The *Magyar*, then, is the language of the Hungarians Proper; and it has long been known as a language of the Fin or Illyrian family; with its nearest congeners in Northern Europe and Siberia.

The alphabet, however, is more Slavonic than the language. Its letters are Latin; but the principles by which they are combined into diagraphs is more Slavonic than aught else. In the use, however, of the letter *s*, the Magyars stand alone. It is sounded as *sh*; so that in order to denote the ordinary sound, recourse is had to a combination; and this is *sz*.

7. Of the Fin, Lap, and a few other alphabets of this class, notice will be taken hereafter.

SECTION XXII.

THE LATIN ALPHABET.

The Phœnician prototype from which the Greek originated, was also the original of the Latin; the Latin, however, was only one alphabet out of four, or perhaps five or six, which extended beyond the Adriatic. There are inscriptions in Spain which indicate what is properly called an *Iberian* form of the Phœnician. There was, probably, a similar modification of it for *Gaul;* unless this, as is very probable, was simply the Greek of Marseilles. There was an *Etruscan* alphabet for Italy; the language to which it was applied

being of uncertain origin; but which, from no point of view, was Latin. Lastly, there were either three alphabets, or three modifications of the same alphabet, for the allied dialects of the Oscan, the Umbrian, and the Latin; and besides these, certain alphabets for certain inscriptions, the language and import of which have yet to be determined.

The two points connected with the Latin which are, at one and the same time, sufficiently general and sufficiently separated from what follows to claim notice here, are—

1. The separation of the numerical from the phonetic power of the letters. *A* was simply, in Latin, the sign of a sound. In Greek it was the numeral 1 as well. How much the notation of the number lost by the practice of the Italian method of substituting such clumsy signs as I, II, III, IV, etc. for letters, it is for the mathematician to decide. It was certainly a gain to the alphabet; indeed, the alphabet for the first time, now came to be purely alphabetic. The result of this was, that, in the Latin alphabet, the condition of order or sequence in the arrangement of the A, B, C ceased to be imperative. As the Latin arrangement is that of ninety-nine dictionaries and Encyclopædias out of a hundred, we may say that the "*dictionary* alphabet" is the Latin alphabet.

2. The Latin is the alphabet of the printing-press.

All beyond this will show itself as we follow the other characteristics of the Latin in the investigation of the details of its application.

SECTION XXIII.

THE LATIN ALPHABET—THE ORDER OF THE LETTERS.

Both the Greek and the Latin alphabets must be supposed to have originally ended with the letter *tau*, or *t*: for so the Hebrew alphabet ends. But beyond *t* there are the five additional letters Υ υ, Φ φ, Χ χ, Ψ ψ, Ω ω, in Greek; and in Latin, U, u: V, v: X, x; Y, y; Z, z. How the Greek got them is doubtful; for the doctrine that they can be ascribed to certain specified inventors is insufficiently supported by evidence; though the claims of Simonides to have been an innovator or improver, deserve attention. In Latin the last four seem to have been introduced from the Greek; and, as they formed no part of the original alphabet, to have been relegated to the end. This is manifestly the case with *z*, as the Greek *Zeta*, or the Hebrew *Zain*, stands seventh in those alphabets. The Romans could venture on an alteration of this kind with impunity; inasmuch as their alphabet consisted of letters only, whereas those of the Greeks and Hebrews consisted of both letters and numerals; or rather, of signs which served in both capacities; and for which some regular order was a necessity.

Z, *z*, is the letter to which this explanation applies most conspicuously. With *Y*, *y*, the case is less clear. *Y* agrees exactly

with the Greek ψ in place. It agrees, to some extent, in form. In power it disagrees altogether. Nevertheless, the two signs are connected in origin, though signs of a different import. *X*, *x*, iz the Greek ξ (*xi*) the Hebrew *Samech*, which, in the first instance, the Latin alphabet either ignored or neglected to keep. It took the *form*, however, of X, χ (*Khi*,) the letter with which it corresponded in place, though with a different import. For the two remaining letters, Φ, φ, and *V*, *v* and ϒ, *υ*, *U*, *u* we may probably claim an independent origin in each alphabet, or, at any rate, an early one of obscure origin; for notwithstanding the extent to which *U*, *u* and *V*, *v* seem to be mere varieties of the same letter, (one for the purposes of ordinary writing, the other for inscriptions,) I cannot but think that they stand in the same relation to one another as *υ* and φ in Greek.

More important, however, than the consideration of the order, is that of—

SECTION XXIV.

THE MERITS OF THE LATIN ALPHABET.

The merits of the Latin Alphabet are as follows:

1. It emancipated itself from the connexion with the numeral system; but the freedom thus created for the classification of the letters according to their affinities was never carried onward toward its legitimate results. A thorough classification of this kind is found in the Sanskrit only.

2. It improved the diacritical mark (') as the sign of a breathing, or as an aspirate, into the truly alphabetic letter *H*, *h*. This is the only genuine new letter it has given us. It was, however, bought at a price. By gaining a sign for the aspirate they lost one for the short *e* (*Epsilon*.)

3. It kept the letter wanted thus preserving, for subsequent use in Western Europe, the letter *F*, *f*; which was the Hebrew *Vau*, which the Greeks allowed to become obsolete as a letter, though they kept it as a numeral.

4. It rejected, in the first instance at least, the compendium *X*, *x*: though, under Greek influence, it took it back afterwards. Upon *Q*, *q* more will be said hereafter.

Subject to these reservations, all these were movements in the right direction.

SECTION XXV.

THE DEMERITS OF THE LATIN ALPHABET.

The very fact of new letters being introduced from the Greek for the purpose of spelling words of Greek origin, tells us, in unmistakeable language, that the Etymological Principle has now been recognized.

The loss of the sign for the Greek *Epsilon* was, as has just been stated, the price of the letter *H, h*. The difference between the long and short *O, o*; the *Omikron* and *Omega* of the Greek, was in like manner left unexpressed.

The letter *H h*, so long as it kept its proper place, was a good servant; when it got beyond it, a bad master. The misapplication of it has been the source of three serious evils; for it has spread from the Latin to most of the languages derived from it; where it has affected not only the native words, but even such Greek ones as may have been introduced into it;—words in the spelling of which it is singularly inappropriate.

1. *Simple misrepresentation.*—For this it is when we imagine that the sound of the *ph* in *philosophy*, etc., is really the result of a *bona fide* combination of *p* + *h*, etc. That it is allied to the sound of *p* is true; but it is equally true that, neither wholly nor in part, is it the same. Nor is the difference the result of any addition of *h*; though the prolongation of the breathing has something (much indeed) to do with it. The sound, in short, is a simple one; one incapable either of being decomposed into its parts, or built-up out of the combination of any two independent articulations. If it were otherwise, and if the letter *h* accurately represented the difference, the sound which stands in the same relation to *b* should be spelt on the same principle; and *v* be expressed by *bh*; in which case *vase* would be written *bhase* even as *fase* is *phase*. We know that, practically, this is not the case with *b*; but we should, also, know that it is not the case, theoretically, with *p*.

2. *The diversion of the combination from its real power.*—When the *real* sound of a consonant followed by *h* has to be represented, confusion arises. Such is the case in words like *haphazard, inkhorn, nuthook* and *hogshead*; where the second element begins with an aspirate. That this ambiguity can be abated by the insertion of a hyphen between the two contiguous letters is certain; for we can write *hap-hazard, nut-hook*, and the like. The expedient, however, simple though it be, is one which is unnecessarily forced upon us.

In compounds where not only the second element begins with an *h*, but the first *ends* in one, the objection is stronger. In words like *Bathampton* (so far as the elements are *Bath* and *Hampton*), *Southampton*, the *h* does double duty; and, in more cases than one, uncertainty as to the true elements of the compound has arisen.

3. *The establishment of a precedent for digraphs.*—This is

——— the head and front of the offending.

The preceding evils have been mere matters of detail. The one now under notice is the establishment of a vicious and pernicious principle. The combinations *ph, th,* and *ch,* as the Latin equivalents to Φ, Θ, and Χ, are the fathers of all subsequent digraphs; the protoplasts of the family of the Makeshifts.

SECTION XXVI.

THE SUBSTITUTION OF THE LETTER C FOR K—K AND S AS SOUNDS.

How *c* came to be used in the Latin Alphabet to the practical exclusion of *k* is a matter connected with the history of the alphabet which need not at present be gone into. We shall best appreciate the full import of the substitution by seeing what it has led to.

C by no means stands alone. This we cannot too closely attend to. What applies to *c* applies to other letters as well: in short, *c* as a letter, is pre-eminently a representative one.

In both the compendiums of the English alphabet, *q* and *x*, the sound of *c* enters.

In *most* digraphs we have either *c* or *h*, or both.

In the system of orthographical expedients, *c* is more conspicuous than all the other letters put together.

Let us begin with what is a good groundwork in all questions of the kind, provided that we can get it; a fact of Language; of Language itself as opposed to spelling, or the mere representation of language; a fact in the history of speaking, not merely of writing, a fact appertaining to the real object rather than to the picture of it. Let the language be what it may, it is a fact that wherever we have the sound of the *k* as in *king*, it is always likely, sooner or later, to be converted into the sound of the *s* in *sing*; or if not this exactly, into something akin to it,—into that of the *ch* in *chest*, or the *j* in *jest*, or something wherein the sound of *s* or its fellow-sibilant *sh*, enters. For what is the *ch* in *chest* but *tsh*, and what is the *j* in *jest* but *dzh*; and what is *sh* but *s* with a modification, or *zh* but a modification of *z* which is a sonant *s*? To *s*, then, in some shape or other every sound of *k* in existence has a tendency to be reduced. The process may be slow, or it may be quick. There are words in which it has not yet been completed; there are words in which it has not yet begun; and there are words in which it never may begin, or words which will be sounded with *k* until the language to which they belong is extinct. Still there is the tendency; while, on the other hand, there are words in which the *k* may have been changed three thousand years ago, or before the oldest alphabetical record in existence.

The change, then, or the tendency towards it, is a fact in language; the representation of it is a fact in orthography. The two may or may not coincide. If they do not, there is the risk of confusion sooner or later. At present, however, the fact in language is the only one under notice.

The first step in the investigation of this lies in the difference between the broad *k* and the small vowels—*a, o, u* on the one side, and *e i*, (and *y*) on the other. We know what happens to these empirically. Before the broad ones, *c* is sounded as *k*; before the small

ones as *s*. But they were not always so pronounced. If they were, why was the *s* used in spelling? The *s* sign existed. Why was the *c* necessary? Because words which once had the sound of *k* no longer retained it; and because words which now have that of *s* had it not when they were first spelt. There is something, then, *non-*-natural in this use of *c* = *s*: and the reason of it lies in the fact that the change of sound and the expression of it in spelling have not coincided. At present, however, the difference between a broad and a small vowel upon the sound of the letter by which they are preceded is the question in hand.

K before a small vowel has a tendency to become *s*. Has *k* the same tendency before a broad one? I think not. *Kop* will not *directly* become *sop*, *shop*, or *tshop* (*chop*); and the same applies to *ka* and *ku—not directly*. But here comes in the influence of the semi-vowel *y*. Now there *is* a tendency to say *kyard* for *kard* (*card*); and *kyind* for *kind*, even with a small vowel. The result may be a vulgarism, a Cockneyism, or the like. But, be it what it may, the change may be either introduced or kept up by so many speakers as to constitute a difference of dialect; and if that dialect happen to become the dialect out of which the literary language is developed, it becomes an error which corrects itself, a wrong which, by precedent and prescription, ends in constituting a right. It is a prophecy which fulfils its own accomplishment. Such, with the letter *h*, is the case with no smaller a language than the Italian. The literary Italian is the Florentine or Tuscan. But the Florentines (so to say) dropped their *h's* (*Aitches*). Before, however, the practice was noted and condemned as a vulgarism the dialect had become predominant, and the practice established. Hence, while it is a shocking thing to "*exasperate*" an aitch in English, it is equally objectionable to sound one in Italian.

But *y* after *k* comports itself as a small vowel; so that, when once *kard* (*card*) is sounded *kyard*, it is in the same predicament as *kird*. That the subsequent details of the change are different for the two combinations will be shown in the sequel: nor will the whole of them be exhibited. *Kyard*, does not, *directly*, become *sard*. It rather becomes *ksard* and *tshard*. It is submitted, however, that, as a fact in language, this is an adequate notice of the principle by which it is determined.

What we have now to investigate is the result of these tendencies, and the extent to which they may affect a language. This depends, mainly, upon the proportion which the sounds of *k* and *s* bear to those of the rest of the alphabet. The greater the share they take in the formation of any particular tongue the greater is the amount of their possible changes; so that here again we are about to be engaged with a fact of language as opposed to one of orthography.

C has already been called a representative letter. But it is this mainly on the strength of its two-sided relations towards *k* and *s*.

It is in these that we must seek the realities of the question before us. *K* and *s* represent actual articulations, true elementary sounds, genuine consonants. *C* merely stands for *s* or *k* as the case may be. *C*, taken by itself, has no reality; and, except so far as its sounds are those of *k* or *s* it has no relations to any other letters. On the other hand, however, the relations of *k* and *s* are those of *c* also: and we shall now see that these are numerous. *K* has its congeners, and so has *s*, so that each forms part of a system.

Herein, *k* stands to *g* (as in *gate*), as *p* stands to *b*, and as *t* to *d*.[4]

But *p* and *b*, *t* and *d* have, respectively, and as pairs, certain relations to *f*, *v* and *th* (both in *thin* and *thine*). Such relations, also, have *k* and *g* to a specific pair of sounds, to which they stand, each to each, as *p* to *f*, and *b* to *v*, etc. These sounds are not found in the English language: neither are they the sounds of the so-called gutturals *ch* and *gh*. What they are will soon be seen.

The *P*-series, as we may conveniently call it, runs through *v* into *w*, and thence, into *u* and the *broad* vowels.

The *K*-series runs, through the two un-English sounds, into *y*, and thence, into *i* and the small vowels.

More than this, the aspirate *h* is allied to both *k* and *g*. In English, then, we have the sequence *ha*, *ka*, *ga*, (—), (—), and *ya*; allied sounds. They are five in number; and, if we had the analogues of *f* and *v*, they would amount to seven. Now every member of this group shares with *k* its tendency to change according to the character of the sounds with which it comes into contact.

S stands alone as little as *k*; being part of the series *sa*, *sha*, *za*, *zha*.

Followed by *y*, *s* and *z* have a tendency to become *sh* and *zh*; as *syoor=shure*, *zyoor=zhure*. This is common in English, though the spelling conceals it. *U*, however, in *sure*, and *z* in *azure*, are sounded *yoo*. *K*+*y*, and *g*+*y* have a tendency to become *ksh* and *gzh*. This, however, is not well exemplified in English; though the change is so important that it will command much of our attention in the sequel. *T*+*y* has a tendency to become *tsh*. The *u* in *nature=yoo*, and the sound is *na-tshur*.

D+*y* has a tendency (though not so strong as it was in the preceding instance) to become *dzh* (or *j*). The diphthong *ew*, when pronounced *yoo*, gives us not unfrequently the sound *jew* for *dew*. This is a vulgarism; but the allied change in *nature* is very good English, or if not, the change by which it is brought about is a genuine process of language in general, and not a peculiarity of any one dialect or language in particular.

Such, then, is the basis in philology of the changes which the sound of *k* may undergo, and of the extent to which an adequate or inadequate, accurate or inaccurate, representation of them by letters may affect the orthography of a language. It is manifest that in

4. Here, as elsewhere, there is sacrifice to conciseness. *K*, *g*, or *p*, etc., means the *sound* of *k*, *g*, or *p*, etc.

k and *s*, taken separately, we have the elements of a series of changes which may extend itself to more than half the consonants of the alphabet; a change which, without any additional elements of disorder is one of vast magnitude.

For the orthographical expression of this the one thing needful is simplicity and singleness of purpose; by which I mean an absolute neglect of every secondary aim: such as that of indicating the history or origin of a word as well as its sound. The simple representation of this would tax the resources of the very best of alphabets. For anything beyond—anything in the way of etymology, a price must be paid, and the little that is gained on the one hand is more than counterbalanced by a loss on the other.

If *k* and *s*, then, even when they stand alone, create difficulties; what will it be when a third letter, *c*, is introduced (so to say) between them; and, with no definite power of its own, is sometimes the equivalent of the former, sometimes of the latter? It will represent each of them in their numerous relations to the other members of the sound-system; and, in doing it, it will just become a letter of more importance than all the others of the alphabet put together. I do not wish to have either the credit or the contrary, of deducing that enormous amount of disorder and confusion which is the undoubted opprobrium of the English system of spelling, from any single cause; or, indeed, from a few causes. I have no ambition of showing that everything which the orthographical reformers complain of is the misfortune rather than the fault of our alphabet, which if it had not been derived so exclusively from the Latin, and if the speakers of that language had not been so prejudiced against the letter *k*, would have been a very tolerable one. Least of all do I imagine that by simply ejecting *c*, or by using it with a change of import, the thousand-and-one chronic and complicated evils of our orthography would be dispelled. All I pretend to indicate is the extent to which a single letter may contain within itself the faults and demerits of many. This means that having dealt with the power of *k* and *s* as *sounds*, we have now to consider *c* as a *letter*; by which, under certain conditions, sometimes the one, and sometimes the other of the two is represented.

SECTION XXVII.

THE SUBSTITUTION OF *C* FOR *K*—*C* AS A LETTER.

We shall see, to some extent, what *c* is as a letter by contrasting it with any of the ordinary ones, let us say with *b*. *B* is *b* always and everywhere. It is this at both the beginning and the middle of *Babel*. It is this at both the beginning and the end of *blab*. Having nothing to do with what it either precedes or follows, it is always a self-sustained and self-supporting letter,—just what a letter should be. The most that can be said against it is, that it is some-

times silent, as in *subtle*, and *debtor*. Even here, however, it is either *b* or nothing: in other words it has nothing equivocal or ambiguous about it. *C*, on the contrary, is nothing of the kind. It depends on its place and its relations for its power: the letter with which it may best be compared being *q*.

Q, if we take it as we find it, as a mere letter in the alphabet, (spelt *cue*,) is nothing as a part of a word. Its power, as such, depends upon what follows: and it is always followed by *u*. This is, perhaps, the only rule in English spelling to which there is no exception. *Q*, then, is no genuine letter. It is merely a part of a combination. But it is scarcely even this. The *u* must be followed by a vowel. We can pronounce *queen*, or *quick*; but we cannot pronounce *qun*, or *quck*. *Q* then is not exactly *q*+*u*. It is rather *q* *plus* half of *w*. Should this seem a piece of over-refinement, the main fact still stands out conspicuously. *Q* is no self-sustained and self-supporting letter. It is a part of a sign which depends upon what follows it.

And so it is with *c*, though, of course, with a difference of detail. *C*, by itself, is nothing; or, what is much the same, it is one of two things. Followed by *a*, *o*, or *u* (a broad vowel) or by a consonant, it is *k*. Followed by a narrow, slender, or small vowel, that is, by *e*, *i*, or *y*, it is *s*. It is nothing when it stands alone; nothing without its determinant. *C*, writes Johnson, "has no *determinate* sound—and never ends a word," a statement which has been enlarged on by Nares in his Orthoepy, and by Todd who criticises Nares. Nares, after remarking that Johnson reduces his own theory to practice, and always writes *frantick*, *musick*, etc., suggests that the better reason is to be found in the old habit of writing *e* at the end of words as *sticke*, *blocke*, and *musicke*. But this does not account for the final *e* itself. In words of French origin it may be attributed to the *e* mute. In words of Anglo-Saxon origin it may be the sign of the dative case in substantives; or it may represent the *-an* of the definite adjective; for the adjective in the language of Alfred and Ælfric ended in *-an* when it was preceded by the definite article; a point of great importance in the reading of Chaucer. This became *-en*, and later still *e*. Eventually it became mute: but not till after the time of Chaucer. Still there was no final *e* in the nominative case, and in many other situations; so that, when it is found here, it must be considered as the extension, by a false analogy, of the sign of the dative termination. However, Nares writes, "As long as that vowel retained any sound, its regular effect, without the intervention of *k*, would have been the softening of the *c*, even if doubled." Hence, he finds in *ck* "a compromise between the sound and etymology." Nevertheless, the principle, as he ventures to prophecy, is not destined to stand against the power of custom; so that he approves the forms *demoniac*, *prosaic*, *music*, *antic*, etc. The longer the word the sooner the change will prevail; because in monosyllables, like *stick*, *sick*, etc., where

"a single letter forms the fourth or fifth part of a word, the eye is not easily reconciled to the loss of the *k*." He, then, gives a list of *dis*syllables,—*arrac*, *barrack*, *haddock*, *paddock*, etc., observing that most of them end in *-ock*; and that in trisyllables the *k* is wholly dropped; compounds like *candlestick*, *laughingstock*, *planetstruck*, etc., being, so far as the final *s* is concerned, monosyllabic. This, upon the whole, is sound criticism; and, what is more, the remarks are suggestive. When Nares tells us that Johnson kept his own rule in practice, he tells us something of the extent to which the lexicographer wrote as a logician rather than as a philologist. He is uniform in the use of the *k* after the *c* in words like "frantic*k*, music*k*, comic*k*," and the like. The practice, of course, was what he found, but he applied it consistently. As a scholar, however, he did it with his eyes open. He well knew the valid philological reasons against it. He knew that, whether derived directly or not from the Latin, the words, as members of a class, were radically, fundamentally, and originally Greek. He knew that *-ic* was a Greek formative. He knew that, as the representative of a Greek sound, *k* was the right and *c* the wrong sign or letter. He knew that the *ĭ* was short; and that, on both Greek and Latin principles, the fact of its being followed by *two* consonants would make it long by position. Yet, for all this, he used the two letters; one of which was a Greek one. It is impossible to say that he may not have thought that this was the best method of showing that the *ĭ* was short: and that if he had written "com*ic*, mus*ic*," etc., the words might have been read "com*eek*, mus*eec*;" a danger by no means imaginary; inasmuch as the *French* (Latin at second, and Greek at third, hand) orthography gave us "com*ique* and mus*ique*." All this, I say, he *may* have thought. He appears, however, to have acted (as has been suggested) on the logical principle. If *c* has no *determinate* sound of its own, and if the doctrine to that effect is to be of general application, it must *always* be followed by something —even at the end of a word: since *c* without a following is *c* without a determinant. Hence, even when not wanted, something must be tacked on to it: so that, when final or followed by nothing, it must not be allowed to exist. This seems to me to have been Johnson's principle. At present, however, we write "mus*ic*, com*ic*, frant*ic*," and the like; having so far departed from Johnson's rule, as inferred from his language and practice (for we do not find it *totidem verbis*,) as to treat *c* when followed by *nothing*, as if it were followed by a broad vowel, *i.e.*, as *k*. *K*, then, we may consider to be its natural sound; as is, doubtless, the case.

I have called Nares's views suggestive; and the remark which has just been criticised suggests Johnson's way of looking at the question; and the opinion of Johnson is no small matter. We should do our best to see what it rests on; especially when, as in the case before us, his practice has been set aside. It is just possible that if some timid innovator, from the north of the Tweed, or from the sis-

ter island, had ventured to suggest that the simple *c* best preserved the etymology, and had received for an answer some such sentence as, "Nonsense sir; clear your head of cant, sir; you don't see your way, sir; *c* has no determinate power as a letter, sir, and when there is no determinant there is no letter for you to talk about;" and if such an answer had come down in the pages of Boswell, we might be writing "musi*ck*," and "comi*ck*," and "franti*ck*," and what not, at the present moment. It is not what is right or wrong, but what certain men choose to say about them that (for a time at least) determines greater events than the use of *c* at the end of a word.

In his remarks on the combination *ck* at the end of a monosyllable, Nares saw something beyond the mere fact of the word in which it occurred being a short one. A vowel followed by a single consonant *looks* longer than one followed by two; inasmuch as it constitutes a larger part of the syllable. In *tic* or *tik* the *i* is one-third of the whole combination; in *tick* it is a fourth. It is only to the reader that it does this, and it is only to the eye that the difference is made sensible. To the ear, *tic*, *tik*, and *tick* are identical. It is to the eye, however, to which spelling, writing, or orthography, addresses itself; and in the investigation of the origin of the practice of indicating the shortness of the vowel by doubling the consonant which follows, the *visible* relation of a vowel to the remainder of the syllable is a very important consideration. Whether Nares's suggestion applies to the particular words under notice is another question.

Unfortunately for the reader the question is one on which there is much more to be said. It is necessary, however, to put the real conditions of it in their true form. There *is* something—indeed, there is a great deal—in Nares's distinction between monosyllables and the longer words. It is referrable, however, to another class of facts. As a general rule the monosyllables and dissyllables in *c* or *k* belong to different languages, and are amenable to different rules in the way of grammar. As a general rule, the monosyllables are English; and as a universal rule they are radical, fundamental, or (if we prefer the term) crude, forms: or in other words, they have no secondary elements attached to them. Yet to the attachment of such elements they are pre-eminently liable. The commonest of these are *ish* and *y* for adjectives; *ing* (as in the present participle) for verbs. Now these three begin with a small vowel, and they constitute, with a few more, nearly the whole class. It follows then that if *bleak* or *break* be converted into "bleak-*ish*" or "break-*ing*," etc, and be spelt with a simple *c*, they run the risk of being read "blea*s*-*ish*, brea*s*-*ing*;" whereas if they be written "blea*ck*," or "brea*ck*," we have a conflict between the two opposing principles; of that by which we indicate the *longness* of a vowel by either doubling it or combining it with another, and that by which we indicate its shortness by doubling the consonant which follows it. When the vowel is actually short we must, perforce, do this, hence "thick, thick-*ish*."

The words of more than one syllable however, are, as a rule, of Latin or Greek origin, and the second syllable is non-radical: as (for example,) "com-*ic*," the adjectival derivative of *κφμη*. Here, then, we have the adjective ready made: and the only danger that lies before us is that of a secondary affix being required which shall begin with *i* or *e*. Such would be the comparative or superlative degree; "comic-*er*, comic-*est*;" wherein there is a danger of their being sounded as *s*. The danger, however, is unreal. We abstain from such comparatives and superlatives. We eschew them. We ignore them. We say "*more comic*," or "*most comic*," instead. The degrees of comparison, however, are not the rocks on which we may possibly split. From every adjective we may get an adverb to match. What if it begin with a small vowel? The danger threatens us again. But the sign of the English adverb does *not* so begin. It is the affix *ly*; so that we may say if we like, *comicly*; and that without fear of risks. But we do not, though we may, do this. We say "comic-*ally*;" taking as our basis, not the actual Greek form *κῶμικος*, but the possible Latin form *comicalis*; a form which may or may not exist.

There is nothing to fear then, in letting *dis*syllables end in *c*, but a great deal to fear in letting *mono*syllables do so.

It is scarcely necessary to guard the reader against taking the last statement at more than it is worth. It is, in no respect, a defence of the *c* in words like "comic" in general. It neither states nor hints that *c* is as good a letter as *k*. All that it means is, that "comic" is a better spelt word than "comic*k*:" and the illustration it supplies is one of the text of Nares exclusively. *C* is better than *ck*. This is what applies to the particular question under notice; and it applies to nothing else directly, So far as it has any secondary application it must be taken with what accompanies it, and with much of what will follow it. It is an instance of what is required if the short-comings of the present manner of spelling are to be made good by the exposition of rules. That they are reducible to rules is admitted. But the rules themselves, even in the most compendious expositions, would take up more space than the whole of the rest of the grammar. Neither are they either applicable or intelligible without much previous knowledge of a wide and discursive character. Hence, when we get them, the only students whom they help are those to whom help is superfluous. So far, however, as the exposition of the complex and unmanageable character of the system of orthographic expedients goes—a system which first gives us *c* in place of *k* for the sake of indicating a fact in etymology, and then an artificial combination to prevent it being sounded like *s*, and then a host more of the same kind,—we are far from the end of it. When the vowel is *short*, as in *thick*, we must use two letters; since either "thic-*ish*" or "thik-*ish*" would run the risk of being sounded "thike*ish*." Akin to this are words like "convo*ke*," "provo*ke*," etc., where there is but one vowel and that a *long* one. Write

"convo*k*" (or "convo*c*") "provo*k*" (or "provo*c*") and the length of the vowel is uncertain. The result is the choice of certain expedients. You may double the *o*; but the *o* so doubled has every chance of being sounded as *ū*. You may prefix an *a* as in "co*a*l;" and so get "prov*oa*k," a form which has actually existed, though now obsolete. "Provo*ke*," etc., has superseded it; so that it and its congeners stand, at the present moment, as monuments of the vitality, usefulness, and indispensability of the irrepressible *k*.

Naturam expellas furcâ, tamen usque recurret.

You may, however, take refuge in *q*, and after the French fashion, write "provo*que*," There are plenty of expedients. The best use, however, we can put them to, is to leave them alone—to make ourselves independent of them. The real remedy for complications of this kind is the sign for a short vowel, as opposed to a long one.

This relative or conditional power of *c* is a fact which affects other languages besides the English: indeed, the disposition to use it at the expense of *k* is no genuine characteristic of any German language. Taken by ourselves we have no prejudice against *k*. When we avoid it, it is because Latin influences have warped our natural impartiality. The extent, however, of this predilection for one letter, combined with the eschewal of the other, will show that, in some cases, at least, it has not been in favor with the etymological, derivational, or historic principle in spelling. In some languages the rule that *c* before a broad vowel, is *k*, and before a small one *s*, is absolute, or nearly so: so that "*c*an, *c*on," or "*c*un," is always "*k*an, *k*on," or "*k*un," and "*c*en, *c*in," or "*c*yn," always "*s*en, *s*in," or "*s*yn." When this is the case all goes smoothly. But sometimes *c* before *a* is sounded as *s*, and sometimes before *i* or *e* as *k*. We have seen what comes of this in the French. In order to spell *sa* with a *c*, recourse is had to the cedilla "ç:" and in order to spell *ki* at all, nothing short of *qu* will suffice, as in *qui*, *quitter*, etc.

Such is our notice of *c* so far as it displaces *k*. But it also does the same with *s*, though only exceptionally, accidentally, and in a few cases. The words which illustrate this change fall into two small classes:—

1. Those like "on*ce*" and "when*ce*."
2. Those like "mi*ce*" and "pen*ce*." Each of these divisions is subdivided.

1. (*a*) *Once*, *twice*, and *thrice* are simply misspelt forms of *ones*, *twies*, and *thries*, the ordinary genitive or possessive cases of *one*, *two*, and *three*. In syntax they are of course adverbs, but adverbs originating in cases have long been recognised. "Unawar*es*, toward*s*, backward*s*, need*s*," (of necessity, as in "Needs must go when the devil drives,") are words of the same class.

(*b*) In like manner "when*ce*, hen*ce*," and "then*ce*" are from "when*nes*" (or "wha*nnes*"), "hen*nes*" and "then*nes*," the only difference between them and "on*ce*," etc., being that the numerals

are derived from the root itself; the words denoting direction in place from a previous case—*when*, *hen*, and *then*.

2. (*a*) In *mice* and *lice*, the plurals of *mouse* and *louse*, the *s* which the *c* represents is not the *s* of "fâther*s*, book*s*," etc., *i.e.*, not the *s* which stands as the sign of the plural number. The plural, or rather collective, character of the form is denoted by the *i*, or rather by the change of vowel in general: the *c* is the *s* of the root.

(*b*) In "di*ce*" and "pen*ce*" the origin of the *c* is different, for it *is* the sign of the plural or collective number, as truly as if the words were written *dyes* and *pennies*.

The explanation of this substitution of *c* for *s* is not very distant. If the words under notice, after the loss of the vowel *e*, etc., were spelt in the ordinary manner, *i.e.* as *on's*, *two's*, *three's*, *when's*, *hen's*, *then's*, *lyes*, *myes*, *dyes*, and *penns*, they would run the chance of being pronounced *on'z*, *two'z*, *threez*, *whenz*, *penz*, *thenz*, *lyez*, *myez*, *dyez*, and *pennz*, like the sound, though not the spelling, of *boys*, *hens*, and a whole host of other words. Now *c* suggests no such confusion. But *c* standing alone is either *k* or nothing. To fit it, then, for doing duty, the mute *e* is appended, the result being that *-ce* spells *s*.

The result of all this is manifest. The true pronunciation of the adverbs and the first two plurals is preserved, while *dice* and *pence* are, respectively, differentiated from *dyes* (for coining) and *pennies*: in other words, a collective rather than plural form is developed. Such being the results, we infer from them something like conscious contrivance on the part of some one; yet so dark is the history of it that we are almost tempted to look upon it as the growth of language itself, working through some such abstraction as the soul, spirit, or organic force of its orthography: in other words, some such an abstraction as an orthography without orthographists.

Now if this unnecessary use of *-c-* were abolished, it would not rise to the dignity of a Phonetic reform. On the other hand, it would be something better than the mere correction of a blunder. Upon ordinary principles the spelling is defensible: inasmuch as, upon ordinary principles, the only objection to it is that it is an unnecessary expenditure of power. As it happens, *se* would have done as well; for *onse*, *whense*, and *mise*, would have been pronounced like *geese*; in which the *s* retains its true power. We do not call *geese* *geeze*, nor should we call *mise mize*.

Most of these forms may be condemned at once, simply on the ground of being unnecessary and gratuitous. But we may go further, and denounce them as violations of the etymological system. This, however, at the first view, we are forbidden to do; for of that system we are the impugners rather than the upholders. Be it so. We denounce them, nevertheless, as blunders; as violations of the system to which they are meant to be subservient. But this is not all. It is not pretended that the etymological principle is an evil in itself. On the contrary, if out of two ways of spelling a word pho-

netically, one will give us the etymology as well as the sound, the one which does so is the better of the two : the only condition being that nothing in the way of Phonēsis be sacrificed to it. With the words under notice, however, there is not only a sacrifice, but an unnecessary one ; indeed one which, according to its own principles, has a tendency to mislead us. "Who*se*" stands for the genitive, or possessive case of *who :* the real spelling, according to existing principles, is "who*'s*" or (perhaps) "who*es* :" for *'s* is the sign of the genitive case all the world over, and it is, to say the least, a very strange etymology to spell as if it ended in *e*.

When *c* before a small vowel is preceded by *s*, the combination, so far as its sound is concerned, is simply that of *ss*, which is that of *s* singly. *Sciatica, science, sciolist*, etc., may, as *sounds*, be spelt with *s* alone, or *c* alone : *i.e.* either *ciatica, cience, ciolist*, or *siatica, sience, siolist*. The function of *c*, however, is to suggest the Latin or Greek origin of the words ; though when the word is *directly* from the Greek it is out of place. The pronunciation here is pretty regular ; indeed when the word is actually Latin, as in *scire facias, scintilla*, etc., the *c* is silent. The second letter, no matter whether *c* or *s*, is merely a superfluity ; and its presence is noted simply because it gives us a piece of etymological spelling with a *minimum* sacrifice of the primary object of orthography. It is an example of the combination of the two principles in its most harmless form : and as such it has been recognized. Even here, however, it involves the necessity of a rule. Is *sc* always equal to *s?* Only before the small vowels. We can do nothing, then, without a qualification ; nothing even in the least obnoxious of combinations.

This, then, though the simplest and the most innocent of all the agents in the etymological system, requires a preliminary statement of certain conditions before it can be put into operation. But, even here, there are complications. It is only in the more modern orthography that this uniformity is preserved. When *skeleton* was spelt with a *c*, as it was in the days of men who were scholars as well as anatomists, and who knew that it came from the Greek word σκελος, as well as they knew the names of the bones of which it was composed, there was a notable difference between the powers of the first two letters. At that time *c* was sounded as *k* ; and the foregoing rule was inoperative ; or, at least, had a certain exception to it ; a fact which makes it no rule at all. However, the men who used the word kept up the connexion with the Greek, not by the means, but in spite, of the orthography ; and now the *k* has come out in its proper form. The mathematicians held less closely to the tradition and the etymology : and an isos*c*eles is called an i-sos*s*eles triangle. Yet both the name of the triangle, and the name of the bony framework of the body, come from the same source. It is, probably, by the association of ideas as determined by the identity of subject-matter that s*k*ull, originally s*c*ull, is now spelt with a *k*. It would be difficult to reduce this to a rule of any practical value. The

reason for it—a very different matter—has perhaps been suggested. At any rate, it gives us another instance of the irrepressibility of *k*.

SECTION XXVIII.

THE SUBSTITUTION OF *C* FOR *K* CONTINUED—*C* AS THE ELEMENT OF A DIGRAPH.

It is now time to consider *c* as the element of a digraph. Followed by *h* it gives us the combination *ch* as in *churl*, *chest*, *each*, etc. In *pitch*, *itch*, etc., it has exactly the same sound; though preceded by a *t;* in other words the combinations *ch* and *tch* are pronounced alike. In *witch* as opposed to *which*, the *t* serves to distinguish the name of a female wizard from that of the relative pronoun. In *pitch*, etc., we have no such differentiation.

In expressing the sound under notice by a combination of letters rather than by a single sign no harm is done, and no error committed: for there is no doubt as to its double character. For the *c* in "witch" write *s* and the real elements present themselves: viz., *tsh*, giving *tshest* for *chest*, *tshurl* for *churl*, and *eatsh* for *each*. For the digraph *sh* substitute a single sign and the word is spelt properly. It is only, however, in one language of the class under notice that this can be done; for there is only one in which *sh* is expressed by a single letter; that being the Magyar or Hungarian. Here *t* has its ordinary power; while *s* = *sh*. Hence *ts* = *tsh*, or the *tch* in *witch*. On the other hand, in German, where the equivalent to the English *sh* is *sch*, the combination runs up to four letters, and what we write *Dutch* appears in the fuller form *Deutsch*. In French, where *sh* is written *ch*, the combination *tch* is rare; indeed, it is only found in foreign words. When found, however, it represents the sound under notice. In Dutch and Swedish it is spelt *tj*; so that we may safely say not only that the real elements are *t* and *sh*, but that the *t* element, at least, is pretty generally recognized.

If this be the case why is it in Russian, and in more phonetic alphabets than one, treated as a single sound, and expressed by a single sign—*Ч* in Russian, and *Ć*, *ç* in the alphabet of the *Phonetic Journal?* The answer to this is part of a more general question than the one now under notice: and for the discussion of this it is reserved. All that is of present importance is the analysis of the combination, and the recognition of the sound of *t* as its chief element. It is *tsh* beyond doubt: though whether it should be treated as *tsh*, a single sound, or as *t* + *sh*, two sounds, is not so indubitable.

If such be the case, what, in the digraph *ch*, is represented by the *c*, and what by the *h?* Place for place, *c* = *t*; and place for place, *h* = *sh* or its equivalent. The connexion on either side is obscure. A connexion, however, actually exists, though it lies somewhat far back. It is founded upon a fact of generality in *language*, and not upon a mere arbitrary orthography.

Let us remember what often happens in words like *kind, kin, cow,* and others, where the sound of *k* is followed by a vowel. There are few of us who have not heard some one among our acquaintance insert the sound *y*, and say *kyind, kyin, kyow* and the like. Public men, especially on the stage, indulge in the practice, and *Punch*, with his fraternity, has more than once bantered them for doing so.

Now when once this habit has fairly set-in, and spread itself over a considerable portion of a language, a further change takes place, and the sound of *y* becomes that of *sh*. Hence, words like *kyind, kyow*, etc., become *kshind, kshow*. That this, at present, is a very rare combination in English is manifest: indeed we can scarcely get it at all without picking the *c* out of one syllable and the *sh* out of another: as is sometimes done with *election* = el-*ek*-*sh*un. In the Sanskrit, where one letter is thus sounded, *election* thus dissected (*ele-kshun*) is, in more than one grammar at least, the word which supplies the example.

The best, however, are to be found in the Scandinavian; not, however, the Danish of Denmark: though in the Danish of both Denmark and Norway the combination *kj* (= *ky*, or *cy*) is common —indeed conspicuously so. Its power, however, varies with the language.

There is not much room for rules here; nor, perhaps, much need of them; inasmuch as the words themselves thus spelt are not numerous; and, as such, may be learned in detail as easily as through the comprehension of a principle; the inculcation of which has never been, and apparently never will be, a favorite method with teachers. Nevertheless, the character of the combination is worth a short notice, the power attached to it being two-fold. The analysis, of course, gives us the sound of *s* + that of *ch*. But *ch* has, at least, two sounds, that of the *ch* in "patriar*ch*," and that of the *ch* in "*ch*est," the former being that of the simple *k*, the latter that of *t* + *sh*. Now as the *ch* which is sounded *k*, is held to represent the Greek X *Khi* (*Chi*, χ) it is fair to suppose that, to those at least who know Greek, the true pronunciation will present itself both naturally and uniformly; and such, indeed, is to a great extent, the fact. Words, however, like "*arch*bishop," tell us that even here there are exceptions. Saving these, however, we may see our way to something like a rule: and we know how to pronounce the word *school*. We may, indeed, congratulate ourselves in keeping closer to the Greek than the Germans, who sound it *shool*; though, like ourselves, they spell with a *ch* = *schule*. It is only, however, when the vowel is *broad* (*a, o, u*) that this pronunciation prevails. What is the practice when the vowel is a small or slender one,—when it is *e*, or *i*, or *y*? At the first view of this question it seems an easy matter to say that, in such a position, the sound of *k* disappears, and that the original rule as to the sound of *c* before a small vowel re-asserts itself, and takes its course; so that whatever else the digraph *ch* may denote under other conditions, it denotes nothing at all here.

It stands in the spelling, no doubt, but it has no orthographical function whatsoever; indeed, it addresses itself to the eye only, and to the eye it suggests a connection with the Greek letter Χ χ (*Chi*, *Khi*). If to this statement any explanation of the principle upon which the combination *sk* (spelt *sch*) when followed by a broad vowel is stable, whereas when followed by a small one, it is variable or evanescent, could be added, something like a rule, something indeed like a principle, would be arrived at.

The example by which this doctrine is illustrated is, of course, the word *schism*, with its derivatives *schismatic* and *schismatical*: and it is amply sufficient for an illustration. But will it give us a rule? Certainly not. The word *scheme* tells us this. The very most that *schism* gives us is a rule for the sound of *sch* before the particular vowel *i*. It is no rule for its power in other combinations. It is not even a rule for the small vowels; since it will not even apply to the *e* in *scheme*. How, then, does *ch* preceded by *s* comport itself? In *schism* it is simply ejected. When and under what conditions does it take its place? If it keep its place, what will be its power? If it disappear will it go alone, or will it carry with it the *h* by which it is followed?

In respect to the first part of the question, it may be said at once, that it will not retain its ordinary sound of *tsh;* though there is no very cogent reason why it should not do so. *Stshool*, and *stsholar* are, by no means, unpronounceable words; and although it is the practice in the English language to eschew the combination of the simple and compound sibilants, it is common enough in Russian, Polish, and their congeners of the Slavonic family. The German forms of speech, however, avoid the combination. This is well illustrated by the Swedish, where the combination *tj* is sounded *tsh*. In words, however, like *stjerna* = *star*, where it is preceded by *s*, the obnoxious combination presents itself: the result being that the three letters are pronounced like the English *sh*, that is, *stjerna* = *sherne*. It is not easy to say what has really been the fate of the *tj* in this change. It has not vanished wholly. If it had, the word would be sounded *serne*. It has not been changed into an *h*; for the *h* itself would be a piece of cacography. Somehow or other it has converted the sound of the first consonant, *s*, into that of the first in *shire*, and that is all that can be said about it. Such is the process in the Swedish: and it is to a certain extent a double one. It gives the sound of *sh*, but it might also give us the simple *s*. It may be, indeed, that such is actually the case; for it is quite possible that the practice of the Swedish language is not uniform, and that sometimes *stj* may develop *sh* and sometimes *s*. If so, it is so much the worse for those who learn to read Swedish; in other words, there is one complexity more; and the orthography is, *pro tanto*, the worse for it. However, in the Swedish this is *not* the case: so that in Swedish the reader who can spell out the sound of *stjerna* can spell out that of the words like it. Is this the case in English? The rule itself is

not unlike the Swedish one. In pronouncing *schism* and *schismatic* as *sizm* and *sizmatic* we ignore the *h* and sound the *sc* as in *scissors*. But does this establish a rule? We have seen that it fails to do this with *scheme* where the *ch* = *k*. Will these two words between them give us a rule; that is, will *scheme* tell us the power of *sche* wherever it may occur? We naturally expect that it will. But it will not. What do we learn from the word *schedule?* We certainly learn that the power of *sch* is very variable. The ordinary pronunciation gives, I believe, *shedule;* but both *skedule* after the manner of *scheme* and *seddule* have their supporters. *Schist*, a geological term, and as such, one of recent introduction, is certainly sounded *shist*; though, as in *schism*, the *ch* is followed by *i*. It is probable that the time at which the particular word was introduced into our language, the language from which it was *directly* and *immediately* taken, and the class of speakers who first approved and promulgated it, have more to do with the particular power which this unmanageable combination assumes, than anything relating to the constitution of the language itself. These, however, are just the conditions which it is most difficult to reduce to rule.

SECTION XXIX.

THE SUBSTITUTION OF *C* FOR *K* CONTINUED.—THE PARALLELISM BETWEEN *C* AND *G*, *CH* AND *J*.

Having hitherto treated *c* in its capacity of a substitute for *k*, as a single letter, we have said as much as is required concerning it; and, evidently, we have said a great deal. And we can see the reason why. We can see that if *c* had never come into the alphabet at all, a great many complexities and contrivances would have been avoided. We may believe that if it had come in concurrently with *k*, some of these might have been avoided. We may see, moreover, that either with *k* or without *k*, it would have been less effective, for bad, if it had been admitted without any reference to its use in indicating the connection of words like *city*, etc., with *civitas*, etc., that is, made subservient to the secondary object of etymology.

We have seen, however, that neither *k* nor *s* stands alone; and, also, that the nearest congeners of *k* are *g* and *z* respectively. Of these the former most especially commands our attention, because, to a certain extent, its history is parallel to that of *c*, and in certain points of detail, diverges from it. Both *c* and *g*, however, change their sound according to the broadness or slenderness of the vowel which follows them. The change, however, of *c* is the more constant. In *gig* and *gibberish* for instance, the *g* is sounded as in *gun*. Again, *c* as we know, changes to *s* (*city* = *sity*), and if the parallelism were perfect *g* would become *z*. On the contrary, however, it becomes *t* or *dzh*, which I hold to be the same in both cases. With

this we must compare *tsh*, or the sound of the *ch* in *chest*. And here I hold that the changes in the two cases run parallel:

1. *Ka, kya, ksha, tsha.*
2. *Ga, gya, gzha, dzha.*

Now, I am not at present investigating the actual history of either of the English sounds *ch* or *j*. I am merely indicating the extent to which the sounds of *k* and *g* are affected by the character of the vowel by which they are succeeded. Each gives birth to a compound sibilant; and, I believe, each, when it does this, goes through the same sequence of changes: by which I mean that every *k* which ends in becoming *tsh* has been, during the process of transformation, both *ky* and *ksh*; and that every *g* in like manner becomes, in the first instance, *gy*, and in the second, *gzh*. I do not, however, hold that every *tsh* and every *dzh* have been originally *k* and *g* respectively, inasmuch as they can be developed out of *t* and *d* as independent roots. For instance:

1. *Ta, tya, tsha.*
2. *Da, dya, dzha.*

Now we have *tsh's* and *dzh's* of both kinds in English, but they are treated very differently in our orthography. The sound given to *u*, *yoo*, and *ew*, after *t* and *d* as in *nature*, *verdure*, *dew*, when pronounced *natshur*, *verdzhur*, and *dzhew*, has already been noticed. That this is condemned as a vulgarism I admit. I may also add that, according to the information of Mr Pitman, who, from having exhibited the so-called vulgarism phonetically, and subsequently recognised the ordinary pronounciation, is a good authority on the matter, the practice of so sounding the combination is on the decrease—perhaps passing away altogether. It may be so. It is possible that with so many of us reading and writing and cultivating our pronunciation, the influence of the orthoepists may succeed in checking the tendency to change; and if they do this they will, to some small extent, have succeeded in what is called the fixation of some part of the language. I do not care to prophecy upon this point. I only know that *ka* and *ga*, *ta* and *da* at the beginning of the series, and that *tsha* and *dzha* at the end, are, comparatively speaking, stable combinations; and that *ky* and *ksh*, *gy* and *gzh*, *ty* and *dy*, in the middle, are, comparatively speaking, remarkably *un*stable ones. If then, I were to prophecy at all, it would be in favor of the vulgar pronunciation eventually winning. Hitherto, however, the compound sibilants, (the *ch's* and *j's*,) which have arisen out of *t* and *d*, have been left alone; indeed we may say that their claim to a spelling of their own has been ignored. The existence, however, of two converging series of phonetic processes by which we get a double origin for our compound sibilants should be recognised. Thus much, however, may probably be said with safety, and to the credit of *ch* and *j*, namely, that wherever we find them we may assume that the original simple consonants out of which they were developed were *k* and *g*, not *t* or *d*.

The lines, however, which we have just traced are, by no means, the only ones. From the sound of *k* we get that of *s*, simply. From that of *g* we get, in an equally simple form, the sound of *z*. In their tendencies to undergo this kind of change the two sounds vary. *Both*, as we have seen, pass into the compound sibilants, *tsh* and *dzh*. *K*, however, pásses into *s* as well. *G*, on the other hand, has no such tendency to become *z*. There is want, then, of parallelism here. It can, however, be explained. *G* has an affinity which *s* has not; one which attracts it in another direction. The tendencies of *g*, when they are not towards *dzh*, are towards *y*, *(ga, ya)*.

With this view of the phonēsis it is mere surplusage to condemn the use of *ch* and *j* on philosophical grounds. One of them is a digraph; the other a single letter; and it is impossible that both can be right. Each, indeed, may be wrong.

C enters into the composition of both our compendiums *x* and *q*; and, in each, it is brought in comparison with *g*. Of *x*, the sound is that of *ks* or *gz*, as the case may be. At the beginning of syllables, where it is found in only a few words, such as *Xenophon*, *Xerxes*, *Xylography*, it is sounded as *z*. The charge of ambiguity against a compendium like *x*, is a grave one. *Ks* we can understand, and *gz* we can understand, when they are written separately. *X*, too, as a single sign, we can understand when we know that it represents either *ks* or *gz* exclusively. But we cannot understand it when it sometimes stands for the one, and sometimes for the other. And this is what *x* does in English. The action and re-action between *c* and *g* is shown in the words which end in *ue*, as "anti*que*," and "uni*que*" on the one side, and "ro*gue*" or "prorogue" on the other. The *qu* in these combinations represents *cu*; so that the two forms run parallel. The use of these forms is purely conventional, artificial, and *non-natural;* especially that in which *g* appears. It is, also, as far as our own language is concerned, of French origin. The precedent was established by the forms in *c (q);* which in words like *loquor*, *liquor*, and others, belonging to the Latin language, seemto have represented a real sound, seem to have had a basis in reality; and the words just quoted may have been sounded nearly as they are spelt. The same was, probably, the case with the *gu* in *anguis*. Still, the *g* was separable from the *u;* which the *q* was not. The tendency of this was to invest *qu* with the character of a single letter when it preceded a small vowel as in *que*, *qui*, (*ke*, *ki*); with that of the combination *cw* when followed by a broad one, as in *quoi*, *quand*, etc. This, again, is an assertion of the old law, by which the character of the subsequent vowel, determines the power, or import, of *c*. One step more, however, is wanted, before the parallelism between the final *c* and the final *qu* becomes complete. This is a determinant, like the *k* in "frantic*k*," as it has been explained in Section 25. It has no sound of its own; but it fixes the sound of the consonant which precedes. The mute *e* does this; making words like "anti*que*, prolo*gue*," etc., sound as if they ended in *-ic*, *-ōg*. At the same time

the combination indicated the longness of the vowel. Such is the history of the terminations *-oque* and *-ique*. *Mutatis mutandis*, it is that of *-ogue* and *-igue (intrigue)* also.

Now this we may take as the typical instance of what we have called an orthographical expedient; a remedy for, or a palliation of, some fundamental deviation from the plain straightforward line of phonetic representation. I do not think that the word non-natural is too strong a term for such manœuvres or manipulations. There are, doubtless, expedients and expedients: there are expedients of different degrees of conventionalism, artificiality, or non-naturalness. Of these the combination *sc*, may, possibly, be the most innocent. The forms in *que* and *gue* are certainly the least so. One merit, indeed, they possess. They are un-English. They are French. So that we got them ready-made; and when we have said this in their favor we have said all. Let us measure the non-naturalness of the combinations before us. If any rule in phonetic spelling be thorough-going, it is that the number of syllables should, in no case, exceed the number of vowels. The diphthongs are no exception, inasmuch as in the sounds of *i (a+i)*, *ow (a+u)*, *ew (i+w)*, and *oi (o+i)*, the second sound is not that of the fundamental vowel, but of a corresponding semi-vowel, *y* or *w* as the case may be. This, of course, gives us *ay*, *oy*, *iw*, and *aw*; so that the rule is adhered to. In the *Phonetic Journal* this is not the orthography. Taking his cue from the old alphabet, Mr Pitman prints *ī* and *ū* by single letters, and *ou*, *oi* by two letters. Granting these two exceptions, which arose, I am informed, from the difficulty of inventing new and homogeneous forms of letters, and the necessity of not extending the alphabet beyond the number of letters absolutely necessary for the phonetic representation of English, the number of the vowels and the syllables agree. What, however, are we to say to such a form as *antique*, where the number of syllables is *two*, that of the vowels four? In Greek, the word would be spelt *αντηκ*; and what can be done in Greek can be done in English,—"antik."

Now it is not too much to say, that every detail that can be found in this and the preceding sections on the subject,—every detail connected with the substitution of *c* for *k*, is non-natural. The details themselves are numerous and complex enough; but their badness lies less in the number than in their non-natural character. Such, indeed, is the predominant character of everything connected with the letter under notice.

SECTION XXX.

THE REDUCIBILITY OF NON-NATURAL MODES TO RULE, OF LITTLE PRACTICAL VALUE.

But it may be said that all these expedients can be reduced to rule. Be it so. We have hitherto said much of certain vowels

which are called broad, and others which are called small or slender. We have not, however, done so as if the terms were merely indicative of some abstract quality. We have generally told the reader that the broad vowels are *a*, *o*, and *u*; the small, or slender ones, *i* and *e*. The letter *y* belongs to the same class; but as it is not always a true vowel, it has not, as a rule, been mentioned. It is a semi-vowel as well; and as it takes its place in a dictionary as such it has been classed, along with *w*, (which is never a vowel) as a consonant; at any rate, as something intermediate between the two classes. I believe that the number of true vowels in English is generally counted as five. We make it six by counting *y*; but, then, there will be only one semi-vowel; and of these there are two, *w* and *y*. Hence, *y* is an occasional or accidental vowel—not a true, not a thorough-going, not an invariable one. Be this, however, as it may, we have the fact that *a*, *o*, and *u* belong to one class, *i* and *e* to another; and that broad and small (or slender), indicate these classes.

I use, then, these words; and instead of naming five vowels in detail, give the names of two classes over which they may be distributed; the one of which consists of three members, the other of two. But, before I can make any use of the more general term, I must explain what it means. This, however, is not done in a moment. Perhaps, between the explanation and the remembrance of it, it takes up, between the teacher and the learner, more time than would be taken up by the simple exhibition of details; which, after all, are only five in number. What, then, is the value of the rule; or how far is it more compendious or general than the items which it comprehends in detail? I answer this by saying that it is better or worse as the case may be. In a treatise like the present it is better; because the present treatise is addressed to those who, to some extent, know beforehand what the terms mean; and who take them without either explanation or definition. But when we teach a child to spell they are worse. To him, who sees the letters for the first time, it is far easier to remember that before *a*, *o*, or *u*, *c* is pronounced as *k*, and before *i* and *e* as *s*, than to understand how *a* differs from *e*, or *o* from *i*. Generally speaking, rules save trouble; but this implies that they are known beforehand, and are specially applied as the case presents itself. It also implies that they cover more details than could be remembered with equal ease without the rule. But what is a rule to a child? What, indeed, is the value to an educated adult when it covers only five cases? But what if neither the rule nor the details which it comprises are wanted? What if the supposed necessity for them be wholly artificial, unnecessary, and gratuitous? What if the exposition of either one or the other, be the mere result of something which only wanted to be left alone? What if the evil be created, or kept-up, for mere sake of the abatement; or the disease for the mere trial of the remedy? Such a thing would be strange. Yet it is no more than what we find in the case before us.

The argument upon this point is simple. Let the question be one of simply teaching the art of reading; and let *k* mean *k*, and *s* mean *s*,—nothing beyond, nothing short of this. Let *c* be nowhere; either absolutely ejected from the alphabet, or used with another power. At least, let it be made wholly independent of both *k* and *s*. Let each word beginning with the proper sound of these two letters be spelt accordingly, or in the natural manner: or, changing the expression, let *can* and *contrary*, be spelt like *kill* and *kettle*, as *kan* and *kontrari*. In like manner let *city* and *cider* be spelt *siti* and *sider*. What happens when the child is taught to spell these words? Simply what happens when he is taught to spell *tabby* or *tippet*, *lily* or *loving*. *K* is to him as *t*; and *s* as *l*. What knows he, or cares to know, or ever dreams of being expected to know, anything about any difference between the vowels which may, or may not, follow? Enough if he knows *i* or *a*, *e* or *o*; for what they are in and of themselves. Whether they affect the sound of the consonant which precedes them, he never thinks of asking. And it is well that he does not. Provided that the alphabet and the orthography are merely what they are meant to be, phonetic, he has no need to ask.

It is clear that, in this case, *k* and *s* are simply in the position of *b* and *t*, *p* and *d*, or any other letters: and it is equally clear that when *c* is introduced it is in a different one, and this a non-natural one.

Now once again be it stated that it is not in behalf of readers, but for children learning to read, that this treatise is written. Phonetic spelling, and phonetic spelling alone, suits these. It suits others besides: but it is enough to show that for those who learn to read it is a necessity. Yet the arguments are not addressed to children. True, they are addressed to those in whose hands the education of the present generation of the children lies; and among them it may (it is hoped) be said without discourtesy that there are many objections, which, to say the least, require to be reconsidered.

SECTION XXXI.

THE DEMERITS OF THE OTHER CONSONANTS COMPARED WITH THOSE OF *C.*—NONE OF THEM NON-NATURAL.

The fault of non-naturalism is co-extensive with the influence of the *c* as a substitute for *k*: and is limited by it. The other consonants are, one and all, open to exceptions; but they are of a different and a more venial kind. Let us take them in order, beginning with the Liquids.

The Liquids, as a class, are very regular in their import, and where they are not so the explanation of their irregularity is evident. Thus, when either *l* or *r* loses, or changes, its natural sound, it is when it follows a vowel; the sound of which has been, to some

extent, modified by the contact. With *l* we find this in such words as *falcon* and *salmon*. We know here that, though the presence of *l*, according to the current pronunciation of these words is, phonetically, objectionable, it was at some earlier (and that not a very distant) period not only justifiable but natural and necessary. The consonantal sound has since been softened down, and that of the vowel only remains In "*fal*con" (*faucon*) it is in the first stage of its change; in "*sal*mon (*sammon*) the change has gone further. To those, however, who say *saumon* the two *l's* are in the same category.

R as has just been stated, agrees with *l* in changing its consonant character for that of a vowel. But this is, also, a natural, and explicable change.

The sound of the *a* in "*f*ather," or of the *a* of the French and German languages, differs from that of the *a* in *fate* and the *a* in *fat*, in the same way that the *sound* of *aw* in *bawl* differs from that of the *o* in *note* or *not*. The *e*, too, at the end of such words as *meine*, *deine*, etc., in German = *mine*, *thine*, is of this character. It is not mute like the French *e*. It is not sounded like *y*, as it would be, were it sounded at all, in English. It is not sounded like *er*, as the Germans sound it; for between the pronunciation of *meine* and *meiner* they make a decided and important difference; and one that often puzzles an Englishman. Nine Englishmen out of ten, especially if they come from the southern counties, think that, if they are told to pronounce the *-e* in *meine*, but not to pronounce it as *meini*, *meinee*, or *meiny*, they have no alternative but to pronounce it as *meiner*. And, in one sense, their opinion is correct. The sounds of the two words are alike; but it is not the vowel *-e* which he pronounces as *er;* but the liquid *r* which he pronounces so lightly as to make it undistinguishable from the simple vowel.

Against the other two liquids, *m* and *n*, the little that can be said is that one of them is occasionally mute. They might both be so; if it were not for a mere accident in the English language. *N* after *m* is silent; and "condem*n*" is sounded as if it ended in *m* only. The combination *nm* happens not to occur in English, otherwise *m* would be mute also; and the statement that *m* and *n* could not come together at the end of the same syllable might take a place in our grammars.

This, again, is bad spelling that has once been good. When *condemn* was a Latin word, it was, at least, a word of three syllables; in which case, *m* and *n* which are now crowded together might be what we may call *distributed*; *e.g.* "condem-*no*, condem-*natus*. However, as the *-o* and *-atus* here are no parts of the original root, but removeable or changeable affixes, and as in the English language they are ignored, the contact of *m* and *n* gives an unpronounceable, or, at least, an inconvenient combination.

The next class consists of the three sonants *b*, *v*, and *d*. At the present time there is nothing at all against *v;* whatever may have been the case when it was written instead of *u*. Nor is there more

than one charge against *b*; and this is the fact that in certain words like "su*b*tle, de*b*tor, dum*b*," it is mute. This, however, like the combination *mn* is obsolete rather than vicious orthography. *D* would be as unexceptionable in its character as *v* and *b* if it were not the fact of being what would be called by a Hebrew grammarian a *servile* letter; *i.e.*, a letter which is not only found in the body of a word but is made subservient to its inflection. Such is the case with *d* in "plant-*ed*, mov-*ed*, call-*ed*," etc., *i.e.* in the past tense and in the passive participle of our verbs, of which it is what is called the sign. How this affects the steadiness and regularity of its sound is best considered when we come to the notice of *s*.

To the three surds *p*, *f*, *t*, we may add *s*; for although this last letter, being connected with *c*, is, strictly speaking, foreign to the present notice, it touches the present group at a point too important to be overlooked. Of *p*, taken by itself, it may be said that, like *b*, it is occasionally silent, as in *psalm*: to which it is scarcely necessary to add that in *psalm*, as in *debtor*, it is only out of place in the present stage of the language. Of *p*, *t*, and *s*, collectively, it may be said that in the combinations *ph*, *th*, and *sh* (the so-called aspirates) they are out of place altogether. Of *t*, in particular, something more may be said; viz., that when it is sounded as in *the*, *thine*, etc., it is doubly so: inasmuch as if the combination with *h* were legitimate, the combining consonant should be here not *t* but *d*.

Now here we have a rough sketch of the elements in the way of spelling of no less than ten letters of the English alphabet; against which we set those of the nine connected with *c*: and we see, at once, that the difference between the two classes is enormous. In some sense, indeed, it is a balancing of *c*, by itself, against nearly half the consonants; inasmuch as the other letters of the class which it represents are, to a great extent, what they are, on account of the connection. The exact nature, however, of the comparison is not worth either enlarging or refining on. The reader has a general view of the relations of the two classes with which it deals; and it may safely be said that no undue charge has been laid against the *c* series. We can scarcely say as much of the other. In this series have been placed the three non-natural combinations of *p*, *t* and *s*, with *h*, so as to form three digraphs for sounds that should only be denoted by single signs. It is probable, however, that this is not the right place for them. It is not with the three mutes that the offence lies. It is rather to be charged upon the *h*: indeed of the consonants which precede it, each is in its right place, provided only that *h* be; i.e., if *f* is to be spelt by means of *h* and any second letter, *p* is the letter that is required. And so it is with *sh*. It is the *h*, then, that has no business to be where it is. If, however, it were otherwise, the *s* would stand where it ought to do. In *th* as a sign for the first sound in *thine* (*dh*), there is a genuine error; since *t* is in a place where, under any circumstances, it is an intruder.

And other abatements may be added. With both *l* and *r* it is

a question of orthoepy rather than of orthography: and there are many who may argue that words like *falcon* and *salmon* are not so much mis-spelt as mispronounced. At any rate, there are plenty of speakers who say *saumon;* and this is one degree nearer to the spelling. Meanwhile, the naturalist, who has often to deal with the word in its more primitive form, always pronounces the *l* in "sa*l*mo" and "sa*l*monidæ." So long, then, as there is a notable portion of the community which says *saumon,* where the remainder says *sammon;* or a similar body of speakers which calls a *faucon* a *falcon,* the question of spelling is merely one of choosing between two pronunciations. A wrong choice may be made; yet, nevertheless, the spelling may be strictly phonetic. This applies in a still greater degree to *r* as it is sounded, or rather *not* sounded, in *farther.* They are many who absolutely make no appreciable difference between this word and *father.* The same persons, in most cases, if they have no knowledge of any language but their own, would, if required to write down the sound of the French, German, and Italian *a,* write *ar.* Foreigners who have asked for my own initials, and on being told that it is R. G., have, more than once, written A. G. On being corrected the answer has been,—"Oh, yes! it is *err.*" The evidence, however, as to the fact is ample. Nor is the explanation that the difference between the *a* in *father,* and the *aw* in *bawl,* and *ar* and *or,* is merely a matter of degree, difficult. With the exception of the tongue, the different parts of the mouth are in the same position in respect to each other. With *r,* however, the tongue vibrates between the lower part of the mouth and the palate. These vibrations may be of any degree of strength or weakness; and when they become evanescent the sound of *r* disappears. After a short vowel, the same result may be expected; so that *er* as sounded in the German "mein-*er*," becomes (the German) "mei*ne*," in the mouth of an Englishman who speaks without due care. And, what is worse, *ŭ,* and *ĭ* are sounded as *ĕ,* giving *ber* as the sound of both *bŭr* and *fĭr.* This is a fact which embarasses the phonetic reformer; for it is a serious thing to eliminate the *r,* yet it must be done if we will carry out phoneticism to the extreme. At present it is enough to say that this softening, or reduction, of the sound of *r* till it absolutely disappears is not universal, however widely it may be prevalent.

There is, then, no undue over-weighting of the *c* series; but rather the contrary. The *c* series is non-natural: the other, faulty, but natural. Let us measure the comparative ease or difficulty with which these several details can be explained, by asking how they would strike an intelligent child, or anyone, indeed, learning to read;—the special persons who have a paramount interest in the matter. Should he have before him a word like *debtor,* or *climb,* and ask how it came to pass that, though the *b* was not to be pronounced, it was still used in the spelling, a very moderate amount of common sense on the part of the teacher would furnish an intel-

ligible answer. The inquirer could be told that, when the word was first spelt, the *b* was actually sounded, but that, in the course of time, some persons left off pronouncing it, and then others, and, at last, everybody contrived to pass it over. This he could certainly understand; and he would, also, when he tried to say "*d*-*e*-b-*t*-*o*-*r*," and "*c*-*l*-*i*-*m*-b," letter for letter, see that the *b* was really in the way, and that, as it was an awkward sound to utter in certain situations, the easier forms *dettor* and *clime* took the place of the others. He might probably say—"Just what I should do myself. If I were talking in a hurry, I should certainly drop the *b*." The omission, then, of the silent letter he could understand; nor would it be difficult to complete the explanation. It is not to be expected that the changes in spelling and writing can be accommodated at once to those of speaking and pronunciation: especially when it is not likely that all the people in England would agree upon a change at the same time. The process is gradual. The change in speech comes first, that in spelling follows after. I do not say that this is the clearest way of putting the matter; nor yet that every learner would fix his attention upon the explanation at length. There are degrees on both sides. There are teachers who are indifferent at explanations, and there are learners who can never attend. I only submit that the difficulty is one in which a very simple appeal to the understanding is sufficient. The same applies to the *r* in *farther* and the *a* in *father;* though in this case it is possible that no questions would be asked. They are few who, in the first instance, are conscious of sounding the two combinations alike. The eye misleads them; and they believe in the difference because they *see* it, and because the meanings of the words are different. At any rate the answer is easy. It is simply true that the habit of identifying them is, by no means, general, and that, thousands and thousands, sound the *r* fully, and differentiate the sounds. Some, without doubt, do it with an effort, on the strength of their studies in orthoepy. But many do it unconsciously. Well, the answer to this is that the difference is real, but that so many people neglect it, that it looks as if the spelling were in fault. With slight variations, an explanation of this kind will carry us over nine-tenths of the difficulties created by these mute or silent letters, when the fact of their being obsolete is the cause of their being mute. Now this is the simplest explanation of a *non*-phonetic form of spelling in the whole domain of orthography; and it applies to the consonants of the class under notice generally. On the other hand, no rule of equal simplicity applies to *c* and its congeners. Here the rules rest on two wholly distinct bases; (1) the fact of *three* signs being used in the expression of *two* sounds, one that, of itself, requires explanation; and (2) the conditions under which each of them is used. That this is far more complex, and far less capable of being elucidated by a mere appeal to the common-sense of the learner than the other, is evident; and it cannot be argued that the simpli-

city of details makes up for the complexity of the original question. In these the fact which carries us the farthest is the difference between the broad and small vowels; and, though it is not denied that perhaps every detail connected with them can be reduced to something like a rule, the subject is so cut-up into divisions and sub-divisions, and each rule covers so few instances, that the whole machinery is of little practical value. The character of a few of the orthographical expedients, the result of this system, has been already indicated. Now this applies to the present system of spelling; and it is meant to show not only that there are degrees in its imperfections, but that the imperfections are so connected with certain classes of letters, as to be susceptible of a natural arrangement: indeed this is so natural that, we may to some extent, arrive at it *a priori*. We know upon what letters the chance of being dropped in pronunciation will fall; for, independent of other causes, we know that certain combinations are practically unpronounceable, and that even out of combinations originally pronounceable the loss of a vowel may reduce them to an unpronounceable condition. Thus it is that *condem-no* becomes *condemn;* and *domino*, if the *i* be ejected becomes *domn*. *K* is as subject to this as *b* or *p;* and, consequently *c*, when it represents *k*, is the same, *e.g.*, in "*victuals*." We know, too, that, let the third letter be what it may, when two sounds have to be distributed between three signs, something like a system of orthographical expedients will be the result. But the domain of orthographic expedients reaches far beyond the influence of the letter *c*. When we express the shortness of a vowel by doubling the consonant that follows, we betake ourselves to a make-shift,—an orthographical expedient. When we denote its longness by doubling the vowel itself we do the same. When we use a second and a different vowel, as in *coal* or *bait*, we are again playing a variation on the same familiar instrument. So we do when we eschew such a doubling of the consonant as *thikk*, and, writing *thick*, yield to the interfering influence of *c*. When we affix a mute *e*, as in *note*, as if in love with variety and ambiguity for their own sakes, we apply a third expedient when one would be sufficient. When we keep up *both* systems, and, having one way of indicating shortness, tack on another to denote longness, we again abuse the variety and multiplicity of our resources; for common-sense tells us that when we have one sign for either shortness or longness, (no matter which,) no second one is needed; inasmuch as what is not the one must needs be the other. Yet we do all this: and when the very number of our expedients makes one neutralise another, we get such combinations as *antique* and *prorogue*, and "all that ends in *que* or *gue*." And what, when we have done all this, if certain old combinations lose their original power? Why, then, we get such results as the well-known powers, or want of power, of the combination *-ough*, which may be sounded as in *enough*, *cough*, *plough*, *through*, and what not: the result of which is the English orthog-

raphy, (no harder name need be given to any form of cacography,) and that for the language of Hooker and Milton.

It is plain, then, that the foregoing sketch of a classification of two classes in our system of consonants, though certainly natural, and, to some extent general, has no pretence, and is never meant to be considered exhaustive. Nor is it meant to be a mere vehicle of attack upon the unfortunate letter *c*; still less as one upon the Latin language.

One of the commonest letters that finds a place at the end of words in English is *y*. It is not the letter we expect when we treat it as a semi-vowel. On the other hand, as a vowel it has no very definite import. When sounded as *ī*, (the German *ei*,) it is a diphthong. In French it is "the Greek *y*"—"*y* Grec." In Latin it represents the Greek *υ* rather than any native sound. In Danish it is the German *ü*, where it is pre-eminently vocalic; an exceptional circumstance in its application to language in general. In our tongue, its sound in *quantity* and *quality* is that of *i*; or, as we write it, *e*. In *quantify* and *qualify*, it sounds as *ei* (in German). So it does in *fortify*, *magnify*, etc. With the first sound it represents the French *é*: with the second, the French *-ier*: which points to the Latin *fio*, and the root of *fac-io*. Whether, however, it gives us the substantive or the verb, the spelling is the same, though the sound is different. In *mighty*, *twenty*, and other words of English origin, it is sounded as in the substantive *quantity*, etc. There is something to reflect upon here. So far as it stands for the French *é*, it gives us an orthographical expedient; inasmuch as the accented *é* is foreign to our language, while the unaccented *e* would run the risk of being dropped as a mute. But this is not the case with the verb *qualify*. Here, we ought, on English principles, to write *i*. But we do not. This is an orthographical fancy. Why do we eschew *i* at the end of a word? The English examples help us to our answer. The *y* in *twenty*, *mighty*, etc., represents a "g" (German *zwanzig*, *machtig*): and the tail or flourish of the so-called *y* with which we round-off our final syllables is really the tail of the Anglo-Saxon and old English "g" (in form "ȝ"). The precedent being thus established, seems to have extended itself to the substantive and the verb;—as an orthographical expedient in the former, as a piece of ornamentation in the latter. In some of the manuscripts of the fifteenth century, we find this "ȝ" in the shape of "z" at the beginning of words. Here the tail is cut off, and it takes the shape of another letter, "z." Hence *zong*, which is, word for word, *young*, has been read as if it began with that letter; and grave scholars have treated the change from "ȝ" to *z*, as a real change of sound; and attributed it to a peculiarity of some specific dialect. There are ambiguities then, in the *form* of, at least, one letter.

Now in this use of *y* at the end of words, where *e* or *i* would be the better sign, we find something that bears on what Mr Ellis calls the "strange-appearance" objection. I think that if we ejected it,

and substituted for it the proper vowels, the eye would be offended. I think it would be as much offended as if we substituted a wholly new letter: provided always (and the proviso must not be under-rated,) that the substitute tallied with the other letters as well as *i* or *e* does. At present, however, I believe that such a new letter is impossible —*at first*. After a time a worse sign might pass without shocking us. It is not, then, the actual form of any suggested letter, and its relations to the rest of the alphabet, that alone constitute the difficulty; though it has much (very much) to do with it. The mere difference of the distribution of an existing letter would, to some extent, disturb our sense of sight.

So much, then, for the prejudice against the two small vowels at the end of a word; though the two which compose the class are in different predicaments. The exclusion of *i* is a mere fancy. For that of *e* there is a better reason. This is an expedient. The danger of its being treated as a mute, so that *quantity* would be sounded *quantite*, is a reason of some kind or other; not, indeed, a valid one, but still a reason. Be this, however, as it may, between the two—between the fancy and the expedient—both the small vowels (for *y* is a semi-vowel,) are forbidden to be final; and, as this looks something like a rule, it may suggest that the broad vowels are *not* so excluded; in other words, that the prejudice or fancy is extended to only a certain division of the vowels. Let us ask how far this is the case? Perhaps we shall find that the prejudice, fancy, or whatever else we may call it, extends to the whole system. We may limit ourselves, however, to the consideration of the monosyllables; for what applies to the shorter, will apply to the longer words as well. And the monosyllabic combinations we may exhaust; as *ba*, *be*, *bi*, *bo*, *bu*; *sla*, *sle*, *sli*, *slo*, *slu*, etc. Now, read phonetically, nearly all these constitute real words: words as they are sounded, or as they are recognised by the ear. What are they, however, to the eye? *Ba* and *bo*, as extempore interjections, may be said to be capable of being spelt as they are spelt here; but great authorities (if there are such things in so small a matter,) probably agree in writing *baa*, to denote the bleating lamb, and say *boh* to a goose. Upon matters, however, of this kind, it behoves us to speak with caution.

Now what are monosyllables that are really spelt with a vowel for their last letter? We can take them in order.

1. *Be*, the verb substantive. In *bee*, the insect, the second *e* is the *e* in *fate*, or the mute *e*, rather than the *e* in *seek*, which is the double *e*. It seems to distinguish the two words from one another. This is, certainly, its use, and it may have been its object.

2. *To*, the preposition. In *toe*, the *e* is mute. The *o* in *too* (*too* much) gives the sound of "ū."

3. *Do* = the Latin *facio*. Here the sound is that of "ū" as in *too*. The *e* in *doe* is the *e* in *toe*. Now here, if anywhere, there is a call for the principle of differentiation. Yet it is wholly overlooked. The *do* which = the Latin *facio*, is one word. The *do*

which equals the Latin *valeo* = *be sufficient, be fit, suit*, is another. He *does this that he may succeed*, gives us the first; *this does well enough*, the second. The former is the German *thun*, the latter the German *taugen;* and, also, the Danish *duge*. There is, in Danish, no such word as *do* = *facio*. The word in that language is *gjöre;* in Scotch *gar;* as *It gars me greet* = *It makes me weep*. The past tense of *thun* is *that* = *did*. The past tense of *taugen* is *taugede;* which in English is *do-ed*, a form which no longer exists. Yet, by analogy, it is a right word; though he would be a bold man who either uttered or wrote it. The fact is that, in English, the two words have been hopelessly and irretrievably confounded. It cannot, however, be said that phonetic spelling would have succeeded in keeping them asunder.

4. *Tho* exists only as short for *though*.

5. *Go* stands on its own merits.

6, 7, 8. *So* does the same, as do *lo* and *no*.

Where two consonants precede, the vowel ending is never found. We write *sloe* and *throe;* not *slo* and *thro*.

It is safe, then, to say, that for some reason or other, the presence of *any* vowel at the end of a word is exceptional. There are, doubtless, reasons why it should be so; and none better than that of the sound itself being rare; in other words, there is a fact in language for it to rest upon. There is no doubt about this; since even where the spelling gives us such forms as *slow, blow, lay, say*, and the like, the semi-vowel represents an original consonant; and this is, perhaps, the fact which suggested the exclusion. Whether the retention of the consonantal element can be justified on the etymological principle is another question. On the first view we are inclined to answer in the affirmative. But, a fact which seems to be either overlooked or ignored is that of the etymological principle being an instrument which cuts in two ways. It professes to help us to the history of a word. But it does so in one direction only. By investing a dead sound with a posthumous show of life, it preserves likeness; but by neglecting the record of a change it conceals difference. The assumption that the one object is to be studied to the exclusion of the other, is wholly gratuitous. That we cannot get both, is self-evident. The real etymologist, however, can scarcely say which of the two should be sacrificed for the sake of the other. More upon this point will be said in the sequel. At present, it is sufficient to suggest that the phonetician has nothing to say to either process. He invests his alphabet and his orthography with only one function, that of representing the sounds of words as he finds them; and, so long as he holds to this, his position is impregnable.

All this prejudice, whatever may have been its foundation, is of comparatively recent origin. It is a growth rather than a fabrication. In the Anglo-Saxon it was simply impossible; since, in the Anglo-Saxon, a whole series of words, such as *steorra, tunga* = *star*,

tongue, etc., not only ended in a broad vowel, but is classed by grammarians in a separate declension. Others formed their plural in *u*, as *scip* = *ship*, *scipu* = *ships*. Earlier still, certain verbs formed their first persons singular in *o* and *u*. In the Northumbrian dialect, the terminations in *a* were conspicuously numerous; for one of the commonest terminations of the ordinary Anglo-Saxon of Wessex was *-an;* and this, in Northumberland, became *a*. In both the north and south, however, as the language grew more modern, each ending changed into *e;* and when the Norman Conquest introduced the French, and, with it, the mute *e*, the distinction between the original *e* of England which was sounded, and the exotic *e* of France which became silent, created a confusion; the extent of which, known to many, is pre-eminently well known to the investigators of the metres of our older poets; and a great deal of trouble it has given them, as anyone who opens a commentary upon Chaucer may see.

But neither the rarity of vowel endings (especially when the vowel is broad,) in the more modern stages of the language, nor the frequency of them in the older, is peculiar to the English. They are common in the Mœso-gothic, and in the Icelandic; and here the spelling represents them clearly, visibly, and naturally. In the German and the Danish they are now fused into the sound of *e;* and both in the Danish and the German, the letter *e* (not mute,) is common; though *a*, *o*, *u*, and *i* are rare. In the Swedish only, where the change has been less rapid, does the broad vowels appear at the end of words, and show their real strength and their true proportion to the other sounds of the language; the result being that the Swedish looks to the eye as it sounds to the ear: a language of less massiveness than the German, but a language of more freedom, breadth, and volume.

Of the semi-vowels little need be said; indeed, one of them, *y*, has already had its full share of notice. We have seen what it is at the end of words. Here it is either a vowel or diphthong, never a semi-vowel; though often, as in *lay*, *say*, etc., silent. Here, however, it represents a consonant; *g* or *k* as the case may be. At the beginning it is used invariably as a semi-vowel. In the middle it has no place except in words of Greek origin, where it represents *υ* or *hypsilon*.

W, like the mutes, is often silent; as in *write*, *wrist*. *C*, or rather *k*, is the same, and under the same conditions, that is, at the beginning of words,—*knight*, *knife*. In both cases their presence is defensible on the etymological principle; and can, moreover, as *write*, *rite*, *wright*, *right;* *knight*, *night;* be defended on the principle of differentiation. At the end of words, as in *blow*, *swallow*, etc., it represents an obsolete consonant,—*f*, *v*, or *g* for the most part. It is in its proper place in the diphthongs, *ow* and *ew*, though not combined with the proper vowel.

The vowels still stand over for notice; and the vowels, as we

shall soon see, have a great deal to answer for. They are, however, best considered in detail when we treat this part of the subject historically. The little that need be said about them, at present, applies to the general character of their demerits, which, in the great majority of cases, are referrable to two heads.

1. The common, indeed, the universal fault of the vowel system, in England, as in other countries, is its primary and original incompleteness. Of *a* and *o* there are the three sounds, allied, yet different; capable of being exemplified, described, and classified. They are, also, susceptible of being named; though there is so little uniformity and system in the terms applied to them that I hesitate to use them. The *a* and *o* in *fat* and *not* are called short; the *a* and *o* in *fate* and *note* are called long: and these are words which are pretty generally adopted. But the difference between the *a* in *father* and *aw* in *bawl*, when compared with the *a* in *fate* and the *o* in *note* (with which it agrees in being long,) is not very uniformly denoted. Let us call it, for the present, the open sound of certain vowels; though the term is one which, in the French and Italian languages we must either abandon or use in a different sense. Now for each of these three modifications, a separate sign is required. It may be a wholly different letter, or it may be the original letter modified in form. We have, however, nothing nearer than *eta* and *epsilon*, and the *omega* and *omicron* of the Greek. This is as much as need be said about the original incompleteness of the vowel system. It is less deficient in some languages than in others, but, more or less, it is deficient in all. So far, then, as it occurs in English it is, by no means, a fault peculiar to that language. It is rather one which we share with the rest of the world. This is not the case with the faults of the second group.

It is one thing to have no signs at all for a pair of allied sounds; it is another thing to have, and to misdistribute, them. Thus, the Greeks have the four signs *η*, *ε*, *ω*, and *ο* for *ē*, *ĕ*, *ō*, and *ŏ*, and they know how to use them. What, however, if *η* were treated as the long sound of *ο*, and *ε* as the short sound of *ω*? This would be an abuse, a blunder; a blunder and an abuse arising out of a misconception of their true affinities. Now some languages make this blunder, and some do not. What orthography is the freest from it, is doubtful. It is certain, however, that English is the most affected by it. The best example of it is our treatment of the sound in "*f*ine." It is really a diphthong, as in the German *feine*. With us it is the long form of the *i* in *fin*.

Now, in calling combinations like these orthographical expedients, I do not say that they are contrivances; or, at any rate, that they are always such. I hold that, in most cases, they were not framed with a definite sense of their future functions, or, that they were not consciously constructed as means towards an end. I merely state that their effect and operation is just what it would have been if they had been so constructed. They are expedients to

all practical intents and purposes. They need not have been meant as such; they need not have been made at all. They seem to have grown: though how we get the results of design with nothing but the mere growth of a system of spelling as the designer I do not pretend to say: nor do I think anyone could explain it without getting within the region of abstractions.

In like manner, I do not consider that in calling these expedients non-natural I make them artificial. In many cases their origin has been, as has just been stated, spontaneous. They developed themselves under certain conditions of language; rather than out of the conscious working of any particular individual; though of this they may be instances. The process by which letters become mute is one of a much simpler character, and the explanation of them may generally be found within the words wherein they occur. Most of the expedients are connected with the letter *c*. That part of our spelling which lies within the immediate and remote influence of this exotic and unnecessary letter we may liken to a tree of foreign origin and southern growth, transplanted on the soil of England: that has brought with it a parasite, by which it is encumbered. The parasite may not be without its uses; for it may indicate to the observer the original country of the tree. It may serve, too, for some subordinate purposes of ornament. But it checks the natural growth of the tree; warping, nipping and distorting both trunk and branch, and weakening their fibre till the whole tissue becomes fragile, corrupt and mouldering. On the other hand, the parts constituted by the original consonants, though neither undying, nor self-renewing, are free from such an incubus as this. The worst that can befall them are the ordinary evils of growth,—old age, and decay. Here and there a branch loses its vitality, and, so long as it remains in its place, encumbers the tree. The remedy, however, is occasional inspection; and a clearing away of the dead wood is all that is needed for a strong, healthy and natural revival of their true vitality.

We have thus exhibited, in a general way, the characteristics of two classes of letters according to their use and power in the spelling of the English language, as illustrative of the principles of the present orthography; in doing which great stress has been laid upon the fact of each group being a natural one: inasmuch as the faults of each division not only differed in number and gravity according to the letters upon which they were charged, but were referrable to a different origin, and amenable to different remedies. There were degrees, then, of faultiness, and, in these degrees, varieties as to the extent to which the faults were more or less easily abated. Nevertheless, under the most favorable view of the more favored of the two classes there was a certain amount of deficiency, redundancy, and inconsistency, of which the best that could be said was that there were certain principles at the bottom of them; that, on these, certain rules could be constructed; and that, above all, there were connected with the system, certain secondary advantages which might be considered as

a set-off to the admitted evils of the system. That there are some such advantages is admitted by the advocate of the Phonetic system; just as his opponent admits that there are some demerits in the existing system. The demerits are both numerous and important. Hence, the question is one of comparison. What is the price at which the advantages of the present system are bought? The phonetician insists that there is no equality, nor even an approach to it, between them.

Now, however much it may be the case, that the complexity of the present system is different for the different parts into which it is divided, and that in one of them it may be much less than in the other, the phonetic system is wholly free from complexity of any sort. In this it differs from the existing orthography not merely in degree but in kind. The extent to which this is the case is so great that it almost degrades the Phonetic principle to a truism. It is too simple, and too natural, to be really a system at all. And, perhaps, such is actually the case. Yet it is purely, simply, and absolutely neither more nor less than the present system divested of its extension to secondary and subordinate purposes. It is simply a translation of the audible sounds of which the ear is the organ that takes cognizance, into the visible signs which appeal to the eye, and which, by so doing, are made permanent. Surely this is sufficient. Surely this is something that can be allowed to stand or fall by its own merits. Surely this is an aim and object which wants no recommendation from any secondary aims to which it may be made subservient. If it cannot stand alone it cannot, and ought not to stand at all.,

Let, then, the simplicity and singleness of this aim be the characteristic; and, as an expansion of this, let the utter absence of all secondary aims be taken as the result. Under these conditions spelling is reduced to the three following operations:

1. The resolution of any word, as the speaker utters it, to its elementary articulate sounds. This, however, as far as the speaker is concerned, is already done; and the signs which denote them are letters.
2. A familiar knowledge of the forms of them.
3. The way of putting them together.

The result is a spelt word: the spelling of which is as pure a matter of certainty as the sum in a series of numbers in arithmetic. This process with letters as the symbols, is not, does not profess to be, easier than the corresponding process in arithmetic. It requires care, and a sustained attention; probably to the same degree. It is not learned with equal ease by every learner. But it is equally simple, and its results are equally sure.

Does it then make bad spelling impossible? It does so in the way that bad addition is impossible. The operator may be careless; or he may manage his tools in an unworkmanlike manner. This, however, is his fault; not that of the system: and for faults of this

kind we must allow in our teaching just as we do in the teaching of the rule of addition. Can as much be said of the present system?

But the learner may pronounce his words wrongly. Be it so. All that the phonetic system requires is that—given the right pronunciation of a word, the right spelling of it shall follow as a matter of course. With a learner from the provinces there are many pronunciations, which, as a matter of standard orthoepy, are wrong. With the best educated men in England the pronunciation of a certain number of words is doubtful. Phonetic spelling does not profess to teach pronunciation or orthoepy. It merely professes to supply an orthography. It takes a certain pronunciation, whether right or wrong, and represents it. The present system does the same; but it misrepresents it. The difference between the two is a matter not of degree but of kind.

SECTION XXXII.

THE PHONETIC PRINCIPLE.

We have hitherto considered the principles of phonetic spelling exclusively in respect to its opposition to the existing systems now prevalent, both in England and elsewhere: and it may, probably, have struck some of our readers that it is only so far as it is antagonistic to something else that it has any existence, or, at any rate, any claim upon our attention. This, however, is far from being the case. If phonetic spelling were as prevalent as it is now exceptional, indeed if it were dominant throughout the whole domain of language, and if the opposite systems were non-existent, there would still be more than one question of some practical importance connected with it. The rule that the representation of the sounds of language is not only the primary but the exclusive function of orthography, though it carries us far, does not carry us all the way.

Upon the analysis of sentences into words, of words into syllables, and of syllables into their ultimate elementary articulations or breathings the whole basis of spelling and writing rests. No analysis, no letter. This is the rule. But analysis, wherever it occurs, or whatever it may be applied to, is essentially a matter of degree. It may stop after the first subdivisions of the subject matter, or it may be carried onwards and onwards, and farther and farther, until not only nothing remains to be separated from anything, but until the last sign of composition has disappeared. At the same time, it by no means follows that this extreme form of analysis is necessary: and, when this is needless, the extension of the phonetic notation is equally so.

Now the reduction of a sentence into its constituent parts may stop at words; or it may go on to the analysis of the constitution of an elementary sound. How far, then, are we to follow it in our notation? There may be sounds that, while they vary from one

another, vary so slightly as not to be worth the sign that should express their difference. There may be sounds that though manifestly compound have their parts combined with different degrees of closeness. In the one case there may be contact, and contact only. In another the contact may amount to continuity, unity, confluence, or fusion: so that when two sounds come into juxtaposition, the combination, to borrow an illustration from chemistry, may be either mechanical or chemical. There are limits, then, to the application of the principle under notice; and it is better that they should be indicated by an upholder of the system than by an impugner.

We must not expect to get much out of any definition of the term phonetic; neither must we argue too much from its derivation. In ordinary conversation, in controversial discussion, and even in scientific investigation, the several derivatives of the Greek word φώνη = *voice*, have, by no means, exactly the same import. That such laxity should exist in the use of so important a series of words is, doubtless, a matter of regret: but such laxity throughout the whole length and breadth of both the English and the other languages of the civilized world is the rule rather than the exception. Those who merely think in a general way that the difference between the spoken and the written language of their countrymen is an evil which should be abated may use the word with the proper amount of generality, and call any alphabet which brings us nearer to the actual phonēsis of our language Phonetic. But if, besides doing this, he be familiar with the question from the controversial point of view, and, learn from it, as he cannot fail to do, the extent to which the English letters are forced to represent something other than the *sounds* of the English language; and that the chief reason for so forcing them is the supposition that certain etymological, historical, or grammatical facts are, thereby, obtained, he soons forms the habit of attaching to the word *phonetic* a meaning which is little more than the opposite to *etymological*. It is probable that when the term is applied to our orthography in general, and when we talk or write about phonetic spelling, this use of the word is the most usual one.

Then, there are those who neither know nor care to know anything about either Phonēsis or Etymology; and these ignore both words. Their name is legion. On the other hand, there are the few who employing themselves in the study of the elementary sounds either of one language in particular or of language in general, look at the term from a purely scientific point of view. The relation which the elementary sounds bear to each other; their classification, the names applied to their divisions and subdivisions; the purely anatomical question of the conditions of the speech-forming organs required for the formation of each particular sound; and, higher still, the purely physical investigation of the nature of tone, pitch, and all that belongs to the theory of vibrations,—all this suggests such a word as *Phonetics;* a word which is no adjective at all but a substantive; a substantive, too, in the same class with Mathemathics, Physics, and

more especially, Acoustics with which it is connected in respect to its subject-matter as well as its form. Questions of phonetics consist, in the first place, of an application of Acoustics and Physiology to a particular point in the formation of articulate sounds; and, in the second place, of the particular relations of such sounds to one another, and the general character of the system that results from them. Now all this is very independent of spelling, or the notation of sounds; so much so that a man may care a great deal about Phonetics, but very little about phonetic spelling. On the other hand the connection between phonetic spelling and phonēsis, or the sound-system of a language is of the closest: indeed the two terms stand to one another as Orthoepy and Orthography. No one should know better the differences between an all-sufficient, or a scientific, alphabet for the English language, and a practical, or an adequate one, than the present reformers. And, indeed, they know it well. If it were not so, they would never have done a tenth part of the work that has been done by them. An alphabet that shall represent the whole compass of the Phonesis of our language must deal with our provincial dialects; and everyone knows that in these we find sounds absolutely foreign to those of the written, or rather the literary, language of our country. Sometimes they are as alien to the classical or standard English as the German *ch* or the French *eu*, and we know that the accurate pronunciation of these is not learnt from mere inspection, not learnt in an hour or day; sometimes, when either the teaching or the ear is deficient, never learnt at all. Nevertheless, we find something very like the one in our northern, and something very like the other in our western, forms of English. Yet for these sounds we find, both in the literary German and the literary French separate expressions; not, indeed, in the shape of new letters but of special and appropriate combinations. For the more refined departments of pure Phonetics a still greater amount of refinement is needed. In short, an alphabet for the ordinary purposes of primary education is one thing; one for the English Phonesis of the language in its fulness and integrity, another; while different from both is the one that is required for the more abstruse questions in Phonetics. Now what is wanted for the purposes of the present treatise is the first; and that only. Its principle is that of the other two, but it is not to be carried so far. It may, indeed, be said that, in this case, the language and its medium should coincide; indeed, the practical test of phonetic spelling is—given the right pronunciation of a word, its accurate representation by spelling should follow as a matter of course; or, to put the case more strongly—given a correct orthoepy, an incorrect orthography shall be impossible. But this implies that the orthoepy should be that of the standard pronunciation. We know, however, that this is not the case, and we also know that if we wait until it is, we shall wait till the Greek Kalends.

I will now illustrate, perhaps over-amply, the distinction, already

foreshadowed, between mere contact and fusion; and it shall be by a combination which, as it is pretty common in our own language, carries with it a presumption in favor of its being of some practical importance. Whether, in the matter of spelling, and for the purpose of teaching, is the easiest, to add so many new letters to an alphabet, and to lay them before the learner as such, or to spell their respective sounds by a pair of letters, already known as parts of the English language, and to show that, by putting the same together the same sound is adequately expressed? The word *adequately* is, of course, used with foresight. The answer, on the first view, is at hand. A single letter in the place of two is only the old story of the compendiums over again. It is merely *x* instead of *ks;* and this we have rejected. It is merely *k+s* written short: and that *x* is *k+s* every one can see: indeed it is seen so plainly that *x* is already unanimously banished in Phonetics.

This is making short work of the matter. But what if the work be *too* short? Why is it wrong, in spelling, that it is simply phonetic to write words like *philosophy* and *Philip* with *ph* to represent *f?* The fact of the letters *not* being the result of the combination *p+h*. The fact that there is no combination at all. The fact that the sound, being a simple one, is properly represented by *f*, or by some equivalent sign equally simple. *F* is allied to *ph;* but it is not made up out of *p* and *h*, nor yet out of *p* and anything else.

Let us now consider the *sound* of the *ch* in *chest*. It has, doubtless, a fair claim to be put in the same category with *ph* for *f*. It is spelt by means of a single letter in Russian, and that with practical advantage. On the other side, either it or something so like it as to be distinguished from it by only a trained ear, is spelt in German by no fewer letters than four. The German for "*German*" is "*Deutsche.*" The *-tsch* is the *-tch* in *Dutch;* which is the *-tch* in in *witch;* which is the *-ch* in *which;* which is *tsh*. Of these two extreme forms, which is the better? The German form, before it can be compared with our own, must be, so to say, purified, or reduced to its lowest terms, by the ejection of the *c*. This brings it to *Deutshe*, which when the *c* in *witch* is reduced to *s*, makes the two words alike, according to the ordinary English spelling. Phonetically, however, the *sh* is *ʃ:* so that the true orthography becomes *tʃ*, (*tʃest = chest*): and of the *t* in *tin* and the *sh* in *shin* the sound is, indubitably, made. But it is written in the most advanced orthographies by a single letter,—in the Russian and in the phonetic English as we have seen. Why is it thus exceptional? Why is the rule which, without a second thought, eliminated our *x*, thus apparently transgressed? Why, too, is the rule violated under which *ph* was converted into *f?*

The reason lies in the fact that, though the sound is as truly compound as that of *x*, the compound is of a different character; or rather in *x* we have no compound at all. Instead of this, we have a combination. In *x* we have *k+s* in a single sequence. The *s* fol-

lows the *k*. The *s* touches the *k*. But sequence with simple contact is one thing; sequence with partial fusion another. And with the *ch* in *chest* we have fusion: and this it is which differentiates the $x = k + s$, and, $ch = t + sh$.

There are few ears which cannot distinguish between the two sounds; few that fail to appreciate some difference between the *t-sch* in *Deutsh*, as pronounced by a German and the *tch* in *Dutch* as pronounced by an Englishman. How it is effected will be seen hereafter.

As the *ch* in *chest* is to $t + sh$ so is the *j* in *jest* to $d + zh$—sound for sound. Both are what are called *sibilant* or *hissing* letters. *S*, *z*, *sh*, and *zh* are the simple, and *tsh* and *dzh* the compound, sibilants; and in these six sounds there is either a system or the part of one.

Now this is merely given as an example of the difference between mere contact, and fusion more or less complete. Whether the representation of the sounds of the *ch* in *chest*, and of the *j* in *jest*, be best given by two letters or one, is a matter of *adequacy*, upon which, at present, I commit myself to no opinion; leaving it to those who have more familiarity than myself with the practice of primary education.

I add, however, that what applies to the compound sibilants among consonants applies also to the diphthongs among vowels; indeed, the combinations are, in each case diphthongal, and I see no reason against the recognition of consonantal, as well as vocalic, diphthongs.

SECTION XXXIII.

LIMITATIONS OF THE PHONETIC PRINCIPLE CONTINUED—ITS INFLUENCE ON A *LARGE* SCALE.

We have hitherto considered the limitations of the phonetic system from one point of view only; or only so far as we were led to them by the process of analysis; only so far as they shewed themselves, so to say, *in minimis*: i.e., in the resolution of certain combinations wherein we could discover the elements, but found them so blended together that they took the garb of simple sounds. But the process may be reversed; and we may take the subject from a different point of view. What if, instead of being found in the ultimate elements of a word, this process of amalagation be found to affect two different words? Is this a real or an imaginary case? We shall find it to be real. We find, indeed, something like it in English. We find *syllables* affected by it. Let us take a word beginning with *con-*. They are certainly numerous enough for all intents and purposes. Betake yourself to a dictionary; and count the words (all of which are compounds) which begin with this favored prefix. Count even the columns; count even the pages that are required to contain them. They are more than all the entries under

several of the less important letters put together. Then take the compounds beginning with *com;* i.e., after counting the words like *contend,* count those like *combustion;* remembering, at the same time, that when *con-* comes before the sound of *k,* and is accented, it is sounded as *-ng.* Observe, too, that before *r* it slips out of the word altogether, and the *r* is doubled; the same being the case when it is followed by *-l* or *-m,* as *collect, correct, command,* etc. The rules that regulate these changes need only to be indicated. The fact, which is here only applied for the purposes of illustration, is universally recognized. The words thus beginning are, as a rule, of Latin origin; and the meaning of their first syllable is *with.* Its form, as a separate word, is *cum.* Before, however, words beginning with *t* the *m* becomes *n;* before *k, ng;* before *m, l,* or *r* it becomes silent, but doubles (to the eye at least) the consonant which it precedes. This is a law of what is called euphony, or harmonious speech; and, as we have seen, is at least common to the Latin and English languages. But it exists, in a more developed form in the Greek as well; and probably, in every language under the sun; provided only that the necessary apparatus of changeable consonants be at hand; that the combinations be sufficiently close to constitute a single compound word; and, thirdly, that the compound be of sufficiently long standing in the language where it is found to have, so to say, shaken down into its true form. They have done this in English, French, and other tongues; whether taken up as Latin words, or put together after the precedents of the earlier examples. They have, also been recognized in the spelling; and both the spelling and the speaking are the better for it.

But what if this practice of euphonic accommodation, adaptation, or assimilation be extended from syllables of the same word, to different words? What if the letters at the end of one word affect those at the beginning of another? The least that can be said of such a case is that it would disguise the real nature of the second; and make the references to an ordinary dictionary a matter of some difficulty.

It may be said, however, that this is a case beyond the pale of the English language; that it does not affect us; and that it is an extreme, if not an imaginary instance. It is *not* the latter: though it *is* the former. For general statements, however, extreme instruments are the legitimate and recognized tests: and the principle now under discussion is the universality of the application of the phonetic system in orthography.

Now the language in which this process of spelling is recognized is no less a one than the magnificent, venerable, and well-spelt Sanskrit. The following extracts, illustrative of this, are from two of our most recent grammars. The process, however, is equally recognized in the older ones.

The change illustrated by the sentence, *Rara avis,* etc., and the change illustrated by the words *συγγνωμη,* are essentially the

same: and, as the connexion, as we shall see, is called *sandhi*, there are two kinds of it, (1) the *internal* which affects the middle, and (2) the *external* which affects the extremities of words.

We are accustomed in Greek and Latin to certain euphonic changes of letters. Thus *rego* makes, in the perfect, not *regsi*, but *reksi* (*rexi*), the soft *g* being changed to the hard *k* before the hard *s*. Similarly, *veho* becomes *veksi (vexi)*. In many words a final consonant assimilates with an initial; thus *συν* with *γνώμη* becomes *συγγνώμη*; *ἐν* with *λάμπω*, *ἐλλάμπω*. . . . These laws for the euphonic junction of letters are applied throughout the whole range of the Sanskrit grammar; and that, too, not only in uniting different parts of one word, but in combining words in the same sentence. Thus, if the seneence *Rara avis in terris* were Sanskrit, it would require by the laws of *Sandhi* or combination, to be written *Ráravirins tirrih*; and might even be joined together thus, *Ráravirinsterrih*. The learner must not be discouraged if he is unable to understand *all* the laws of combination at first. To attempt to commit to memory a number of rules, the use of which is not fully seen till he comes to read and construct *sentences*, must only lead to a loss of time and patience.—*Monier Williams; Practical Grammar of the Sanskrit Language. Chapter* 2.

In Sanskrit every sentence is considered as an unbroken chain of syllables. Except where there is a stop, which we should mark by interpunction, the final letters of each word are made to coalesce with the initial letters of the following word. The coalescence of final and initial letters) of vowels with vowels, of consonants with consonants, and of consonants with vowels) is called *Sandhi.*

As certain letters in Sanskrit are incompatible with each other, *i.e.*, cannot be pronounced one immediately after the other, they have to be modified or assimilated in order to facilitate the pronunciation. The rules, according to which either one or both letters are thus modified are called the Rules of *Sandhi. Max Müller; Sanskrit Grammar for Beginners.* Chapter 2.

The Sanskrit is a dead language; so that the exact appreciation of the extent to which this system of *Sandhi* either helped or impeded the reader is impossible. Much, however, as its novelty may strike us, the practice is more or less common in many languages; though, as Wilson remarks, the change is prosodial rather than grammatical.

Contrivances for avoiding the concurrence of harsh or incongruous sounds, or the unpleasing hiatus which arises from keeping sounds apart that are disposed to coalesce, are not wanting in all languages. They are in general, however, rather poetical or prosodial than grammatical; such as the elision of a final *e* before an initial *e*, in such a concurrence as "the etherial height of heaven," which it was formerly the fashion to write, as the measure demanded, "*th*' etherial;" to say nothing of the synalepha and ecthlipsis of the Latin verse "Monstr' horrend' inform' ingens," etc. Other instances of regard for euphony, however, do occur, independent of prosody, and especially in Greek, in which many of the euphonic changes are analogous to those provided for in Sanskrit.—*H. H. Wilson; Introduction to the Grammar of the Sanskrit Language.*—Chapter 2.

SECTION XXXIV.

THE PHONETIC SYSTEM—ITS OCCASIONAL LIABILITY TO BE APPLIED PREMATURELY. ITS INFLUENCE UPON THE FIXATION OF A LANGUAGE.—HISTORICAL VIEW OF THE TWO SERIES *K-TSH* AND *G-DZH*.

The question as to the extent of the applicability and the universality of the application of the Phonetic System has thus far been illustrated by two classes of facts; those that relate to the analysis of certain combinations, and those that relate to the effects of the Euphonic Principle: and it is clear that the two groups are very different. The limitations that they illustrate are what we may call Formal; inasmuch as it is with the particular forms which such or such an orthography may take that they are specially connected. In the division of the subject now coming under notice the question of Form will be wholly out of sight: for the question will be one of Time rather than aught else: time meaning that particular stage in the development—that date in the lifetime of a language—for which the application of the phonetic principle is, comparatively speaking, well or ill adapted. The introduction of an alphabet, and along with it, a reduction of the language to which it applies to writing is, of itself, a boon of such unparagoned value that there is no possible time or season at which it can, under any circumstances, be other than a good. It is one of those blessings which can never come either too early or too late. At the same time, the period during which the language, either wholly or partly, is, more or less, in a transitional state, is not the best time for its introduction. There are, probably, in all languages, at every period, certain words of which the pronunciation is not absolutely fixed; and that, not so much because certain speakers have not come to an agreement as to the way in which certain doubtful words are to be sounded, as because there are (as facts of language) certain combinations of an unstable character: *unstable*, be it noted, being a word which we have seen before, and one which we shall see again; a word of no slight importance in both this and the following section. The term was applied to the series

1. *Kia, kya, ksha, tsha:*
2. *Gia, gya, gzha, dzha,*

and no series better illustrates it: and no series better shows what would happen to an orthography which was introduced either just when the pronunciation of *ka* or *ga*, began to grow unsteady, or just when *kya* or *gya* was beginning to change into *ksha* or *gzha*; or these sounds, one or both, into *tsha* or *dzha*—where, for the first time we get a *stable* combination. The least that can be said of them is that they would run a chance of being very soon altered: and though this is an objection of very little weight it is sufficient to show that there are certain times in the lifetime of a

language, when either the introduction of a new, or the change of an old, combination, is less likely to be permanent than at others: a remark which we may now conveniently illustrate by the actual history of these two series—not, however, for a reason which may have already suggested itself, so closely and so exactly as we wish. Nevertheless, by referring to one language for one, and to another for another, part of the process, we arrive at a reasonable conclusion; and invest a sequence of changes which has hitherto been based on *a priori* notions, with something like the reality of history.

We begin with the two extremes. There was a time when the *c* in words like *chest* and *Chester*, was sounded as *k*: and of this time, there is, in most cases, ample and superabundant evidence. Had the *c* to which we *now* give the power of *s*, always been so sounded, it would never have been introduced in any language where a sign for the genuine and original *s* existed. What, indeed, would have been its use? If words like *city*, had always, or when they were first derived from words like *civis*, been sounded *sity*, how would they differ from words like *save*, *slave* and the like; and, if not differing, why would they require a special sign or letter? Again, if the original sound were not that of *k* why would the letter *c* be assigned to them? For *c*, to a great extent, is the same as *k*. It it needless, however, to limit ourselves to the consideration of the presumptions of the case when there is evidence enough to make them unnecessary. It is admitted that the *c* in such a word as *city*, was once sounded as *k*. Thus much, perhaps, would hardly have been denied by a respectable philologue in the days of our distant ancestors. At the present time it is insisted upon; in some instances to the extent of changing the existing pronunciation of English-Latin; or Latin as it is taught in England. Upon this, it is needless to enlarge.

Now if the evidence of the Latin language be condemned as insufficient there is that of the Greek in the background. With words like *κητος* and *κιστη* to give us the old sound of the *c* in *cetaceous* and *chest*, we may, if necessary, dispense with the evidence of the Latin language altogether. Do I hold, then, that in the Italian where the *c* before *i* is sounded just as it is the English *chest*, it has grown out of that of the *k* in *κιστη*, and that the connection between these two extreme forms is that of the sequence *ke*, *kye*, *ksh*, *tsh*, with an unstable, transitory, or even ephemeral *ksh*, as a missing link, may have had a function and played a part—a short but important one? Such is my belief: indeed, it is already to be found, implicitly, in what I have already written. If *tsh*, then, have been *ksh*, and *ksh* have been *ky*, and *ky* have been *k*, and the changes from one sound to the other have gone on more rapidly than the corresponding change in the spelling, it is possible that one or more than one of the intermediate forms may never have been recorded; never, indeed, indicated or even hinted at. It is more than possible. It is almost certain that such has been the case.

That the *c* in Latin, at some comparatively early period, was sounded as *k*, is certain; certain, too, it is that at a comparatively late period (*i.e.* the present time) it is sounded both as *tsh* (in Italian) and as *s* (in French and English). The power, however, of the letter during the intermediate period is by no means certain; and the longer that period is the greater the chance of some intermediate stage falling within it. It does not, then, follow that because the Latin *c* = *k* at one era of the Latin language, it may not have been something else at another, namely, *tsh* or *ksh* as the case may be—*tsh* at a late date, *ksh* at an intermediate one. In our own language I hold that in some words we have the series of changes in full; from simple *k* to complex *tsh*. The simple *k* we get in the Latin *castrum* or *castra*. The West-Saxon spelling, however, is "*ce*aster;" where the *e* = the German and Scandinavian *i* or *j*; which, in its turn, is equivalent to English *y*. Hence, *ceaster* = *cyaster* = *kjaster* in Norse and German. But the Norwegian reading of a word thus spelt is (approximately) *kshaster*, which, in Swedish, is *tshaster*. At one time the word under notice was sounded *kyaster*, at another *kshaster*, at another *tshester*—the change from *a* to *e* being no part of the present question. That *Chester* is now called *Tshester* is certain. That the poet *Ceadmon* called himself either *Kyadmon* or *Kshadmon*, and that his contemporaries said either *kyaster* or *kshaster*, I hold to be nearly certain. But, how some scores of words were sounded in this or that district, at this or that time, during the intervening period, I cannot say. I cannot say when an older form died out, nor yet when a newer one started into life.

If *g* stands to *dzh*, as *k* to *tsh*, the history of the two series

Ka, kya, ksha, tsha
Ga, gya, gzha, dzha

may be expected to run parallel to each other. But we have already said that this is the case only on the first view of the subject. In reality the lines diverge; the reason being, as has already been stated, the affinity, in an opposite direction, between *g* and *y*. Hence, while *ka* almost always runs through *kya* to *ksha*, *ga* often runs through *gya* to *ya*.

Now the actual exhibition of these changes is not an easy matter: and we know the reason why. The chances are that a sound which changes quickly may pass away without ever being recorded; and without leaving any visible sign of its existence; more especially is this likely in languages where there is no sign for the sound of *sh*; as is often the case. The best illustration known to me is to be found in the triple history of the combination *k* + *y* in the three countries of Denmark, Norway, and Sweden. The ordinary spelling is *kj*; *j* being, as in German, the sign for the semi-vowel *y*. In Denmark this is sounded sometimes as *k* simply, sometimes as *ky*. In Norway it is *ky*, and something very like *ksh*. In Sweden it is *tsh*. Whether, or when, the Danish will go farther in the direction of *tsh*, remains to be seen. The Swedish has attained that final goal.

The Norwegian gives the transitional form. But there is no use in concealing the complications of the question. The transitional character of the Norwegian *kj* is itself transitional: and it is only dealing fairly with the reader to show the extent to which this intermediate sound is, or is not, found in Norway. The present writer may, also, add that, upon the nature of it, he is not only an exposition, but a witness, and not a mere second-rate authority. The connection of the Norwegian *kj*, with *ksh* cannot be seen by mere inspection. The Norwegian language, unlike the Swedish, has no specific grammar of its own; because, though the Swedish is treated as a different language from the Danish, the Norwegian, so far as the written, literary, classical, or standard language is concerned, is simply Danish. The explanation of this is found in the political history of the two countries; a point which needs only being indicated. There is, indeed, at the present moment, a movement in Norway to develop out of the provincial dialects an eclectic form of speech which shall, at one and the same time be non-Danish, non--Swedish, Sandinavian, Norse, Norwegian aad national; in short an artificial language: an attempt upon which we pass no opinion. Hence, as literary languages, the Norwegian and Danish are the same: and, though such may exist, I know of no grammar which makes the peculiar Norwegian sound of *kj*, the object of any special treatment. It is not, then, on the surface that this peculiarity is to be found. Yet everyone who has any practical knowledge of the Norwegian Danish knows that in words like *kjöre* = drive, and *Kjöbenhavn* = Copenhagen, etc., the sound of the first two letters is different in the two languages, dialects, forms of speech or whatever we choose to call them. Sometimes, indeed, they are identical, but, in this, the influence of the written language plays a part. But, even when the difference is manifest, the pronunciation of the differentiated combination is not constant. Sometimes it is that of the true continuous surd of the *k* series;—a rare sound. Upon the whole, however, it is a sound which is to *ksh* as the *ch* in *chest* is to *tsh*. I speak upon the point as a witness, because I am not aware of this very important fact in phonetics having hitherto had more than a cursory notice—if it has had this. But, at the same time, I speak with the diffidence of one who is pronouncing upon a sound foreign to his own tongue; and as I make no secret of being suspicious of other persons in such cases, it is only right I should, to some extent, draw attention to an opinion of my own. I have, however, made a point of checking it by that of natives; and, although I cannot say that an Englishman who sounds *kjöre* exactly as *kshöre* will speak exactly like a Norwegian, I have no hesitation in saying that he will utter the sound into which *ky* ran, and out of which the Swedish *tsh* arose. This I believe, in the special pair of languages before us, it preceded, as a cause precedes an effect. I believe, also, that it has done so in many other languages; in other words that the order of sequence is a fact of very general occurrence. Upon its univer-

sality I see no need of delivering an opinion. Practically, however, I hold that the presence of *tsh*, connected with the *k*-series, implies a previous *ky*; and that *ky*, wherever it occurs, is a *tsh in posse*. Yet the evidence to the reality of this sequence of changes is so indefinite that, even in the best illustration I have been able to hit upon, the line of argument is circuitous and indirect. No wonder. The same fact in language which makes *ky* and *ksh* unstable combinations, exposes them to the risk of not being orthographically represented.

But the Norwegian forms of the Scandinavian or Norse, tell us something more. Instead of *gy* running parallel with *ky* it diverges. Instead of running into *gzh* it runs into *y*; so that, while *kjöre* = *kshöre*, *gjente (wench)* = *yente*: a difference which has already been indicated.

There are two other sounds of the *k* series which still require notice: viz., the two which stand to those of *k* and *g*, respectively, as *f* and *v* stand to *p* and *b*; or as the *th* in *thin* and *thine* stand to *t* and *d*. There is much more to be said about them than is to be found in the ordinary grammars; in many of which there is much that requires correction. Neither is it very easy to write about them concisely; inasmuch as the terms which apply to them are less definite than they should be. In describing or classifying the *mutes* of either the English or any other language, it is barren work to talk of them as lenes and aspirates, or as hards and softs. But, as they actually form a system, and as that system must be exhibited, four terms at least are required. *Explosive* and *continuous* (sometimes, more conveniently, *explodent* and *continuant*); *sonant* and *surd* will be the terms used here: the last two from the grammars of the Sanskrit grammas, *explosive* and *continuous* from the older writers in general; especially those who treated the classification of articulate sounds as anatomists or physiologists. The *b* in *ba*, when pronounced separately from the vowel, is explosive, and sonant; explosive because the sound, as that of a consonant only, cannot be continued; and sonant because its sound is uttered at the ordinary pitch of the voice. *F* on the other hand is continuous and surd; for the sound itself can be prolonged; but, whether prolonged or not, it is uttered as a whisper. Hence the following system:

EXPLOSIVE.		CONTINUOUS.	
Surd.	*Sonant.*	*Surd.*	*Sonant.*
p	b	f	v
t	d	th (in *thin*)	th (in *thine*)
k	g	?	?
—	—	s	z
—	—	sh	zh.

In the *s* series there are no explodents; so far, however, as sonancy and surdness go, it agrees with that of *p*, *t*, and *k*. If it were otherwise, and if we could add the surd and sonant continuants of the *k* series, or, changing the expression, the sounds which stand to *k* and *g* as

f and *v* to *p* and *b*, etc., we should have a full and perfect quarternion; or four series of four similarly modified forms. As it is, we have only an approach to it. The class, however, as far as it goes, is natural. The sounds which constitute it are more closely allied with each other than they are with the sounds of any other group; yet, at the same time they have relations with the rest of the alphabet *V*, related to *f*, on the one side, is related to *w* on the other; through *w* to *u*; and, finally, through *u* to *o* and the vowels in general. Then there is an affinity between *m* and *b*; so that the full sequence runs

m, b, p, f, v, w, u, etc.,

with a liquid at one end and a vowel at the other.

We have nearly the same sequence in the series beginning with *k*; and, if we had, on our language, the continuants of *k* and *g*, we should have it entirely. Now what are these sounds? They are *not* those of the so-called gutterals, *i.e.*, *kh* (or *ch*) and *gh*; sounds which, though foreign to our own language are common enough elsewhere: as in the German, the Welsh, and the Gaelic. These are *not* the continuants here under notice; though often confounded with them. The place of the continuants in the sequence is that of *f* and *v* in the *p* series; and that is between the explosives and the semi-vowels; a fact which connects them with *y*, just as *f* and *v* are connected with *w*. Now these are conditions which are not fulfilled by the so-called gutturals.

The sound is a rare one. It is certainly found as one of the pronunciations of the Norwegian *kj*. It may be heard occasionally, and sporadically, in England. There are certain speakers who, when they use the word *h-u-m-o-r* never say, exactly, either "*hew*-mor," or "*yoo*-mor," but something like *oo* preceded by a sound intermediate to that of *k* and *y*. With stammerers, as far as my own observation goes, this practice is common. Now this is the sound in question, or the continuant of *k*. It is not, of itself, an easy sound; still less so when we have to compare it with its nearest congener, the continuant of *g*. In fact, the latter generally runs into *y*. It may be heard, however, in more than one of the Low German dialects. Like *ky* and *gy*, to which it is closely allied, it is a very unstable sound; and, as such, rare.

Thus much has been written upon the question of Unstable Combinations; and it has been written with a special view to the following question. Admitted, that an alphabet with its corresponding orthography is, in and of itself, an undeniable benefit to a language, can there be such a thing as certain times, dates, or stages in the growth, or development of that language in which the introduction of it is less opportune at one season than at another? Instances have been given to show that something of this kind exists. The next question is whether they be the only ones; and then follows the question, as to the extent to which they occur in English; and, if they do, what they account for in the way of objectionable spelling.

SECTION XXXV.

THE ENGLISH LANGUAGE AS ADAPTED FOR A PHONETIC ORTHOGRAPHY.

Over and above the particular stage of a language into which a phonetic alphabet is introduced, is there anything in the structure of the language itself, upon which either an objection or a recommendation can be grounded?

We have said already much about the facts of language; treating them as potent, influential, and sometimes irresistible forces which determine certain results independent of any artificial or spontaneous conventionalities in the way of representation. It would, then, be a suicidal argument to hold that any language in the world was so constituted as to make a natural and simple orthography, an orthography limited to the mere representation of sounds and combinations as they actually exist, impossible. On the other hand, however, it would be a wilful neglect of patent and well-known facts to deny that, in the adaptibility of languages to such an expression, there are degrees. Some languages lend themselves to it spontaneously, others are not amenable to its treatment; except at the price of a contrast between one modification of a word and another. Thus, a language that, for instance, forms its genitive in the syllable *es* or *is* is less disturbed in the spelling of its inflections than one which merely adds the single letter *s*. This is because, in the former case, it does not matter in what kind of a consonant the radical part of the word ends. Whether the root end in *b* or *p*, *t* or *d*, *k* or *g*, we can add *is* without superinducing any further change. If, however, we merely add the sound of *s*, a change must take place, and one of the two consonants must be accommodated or assimilated to the other; in other words, we must, if the word be *slab*, write either *slabz* or *slaps;* if *knot* either *knots* or *knodz*. Combinations like *knotz* or *knods* can be, without doubt, written and seen, but they can neither be heard nor uttered. Such is our first instance of the Law of Assimilation, and we shall see that it goes a long way. Now the operation of this gives us one of the commonest and most prominent facts in the English language. It is the rule of the formation of both the genitive case and the plural number of our substantives. Yet we dispense with the phonetic exhibition of it, and write *stags* for *stagz*. Here, then, is a fact which would undoubtedly complicate the rules for the formation of two of the most important inflections in our language if they extended to our spelling; but it is, also, one which, as far as several centuries of experience teach us, we may ignore in our speaking. Doubtless, it is neither more nor less than an instance of the insufficiency of our orthography. As far, however, as it goes, it is evident that we can get a large amount of work out of an insufficient one; and this is an argument that a conservative may fairly make use of. But the antagonism

may go farther. There may be cases where the letter *s* (that is, the sound represented by it) may be tacked-on, *immediately*, to a word in *b* or *d*, while the sound of *z* is wholly wanting to the language itself. In such a case it is evident that the latter of the two sounds cannot exist; so that no change, accommodation or assimilation can be effected in that direction. Hence the *b* must be changed into *p*, and the *d* into *t*. But this affects the radical, or fundamental, part of the word, and, by so doing, does much towards disguising its nature; since the combination must now come out *slaps*, etc. The English language does not, indeed, go so far as this. If it did, however, the result would be as has been indicated. Now this is the way by which the *last* part of a word, if such be the habit of the language, may be metamorphosed.

Let us now ask whether the *middle* part of a word can be thus affected? The best way of illustrating this is to take some language which gives us such affections as a general rule. By this we measure the extent of its influence. The following is from Euren's "Finlandic Grammar." It is not exactly an extract; it is rather an abstract. It gives us, however, the real details of a very important and relevant process.

The *hard* (this is the Swedish term) vowels are, *a, o, u;* the *mild, ä, ö, y;* the *light, e, i.*

The Vocal Harmony (*vokal harmoni*) means that the *hard* vowels (*a, o, u*) can never follow or precede any *mild* one (*ä, ö, y*), in a non-compound word. The *light* ones *(e, i)* can follow or precede both; but a *light* vowel in the radical part of the word requires to be followed by a *mild* one: as *talolla, ottavat; tylsällä, kyntävät;* and, from *tie, mies, tie-llä, miehe-nä.* Hence, words have two kinds of endings; one with a *hard,* and another with a *mild* vowel; *i.e.,* with *hard* vowels in the root a *hard* ending, and with mild ones either a *mild* or a *light* one.

The *light* vowels are our old friends the *small* or *slender* ones.

Here the character of the vowel which follows is determined by that of the vowel which precedes.

But in the Gaelic the influence is reversed, and *small* endings give rise to *small* vowels in the root: a process which affects the middle syllable. Thus—

A, o, are called *broad* vowels, . . . *e* and *i small* . . . The poets, in latter ages, devised a rule, which prescribes that the vowel which goes before a consonant, must be of the same class with that which follows that consonant, *i.e.,* both broad or both small. *Neilson's Introduction to the Irish Language.*

That this assimilation is not found in the older manuscripts is specially stated; but it is not stated that this is not a fact in the spoken language as well as in the existing orthography. And in both it *is* a fact. The same change, in a more artificial form, occurs in the German under the names of "*um*laut," or "*about*-sound;" and this, like the Irish assimilation, is not found in the Mœso-gothic, or the German in its oldest known form.

This, then, tells us how the *middle* part of a word may be affected.

Now let us ask what the Keltic languages teach us as to the alterations of the next *beginnings* of words. Any elementary work on the Welsh (where there are no true case-endings) tells how the first consonant of a word is modified according to its place in a sentence. Thus—

Cār, *kinsman.*
dy Gâr = *thy kinsman.*
fy Nghâr = *my kinsman.*
ei Châr = *her kinsman.*

Pen, *head.*
dy Ben, *thy head.*
fy, Mhen, *my head.*
ei Phen, *her head.*

and so on, with variations according to the consonant with which the word begins. Now the Welsh, phonetically, is one of the best-spelt languages in the world. But, if we can bring ourselves to imagine what it would have been had it been written in the manner of the English, and (what is a lighter effort) imagine that the reform had been deferred till the present moment, it is evident that the Welsh conservative might appeal to the etymological doctrine with more cogency than the English one. There are degrees, then, in the validity, or, as the Phonetician would say, in the plausibility of the objections on the score of etymology; the etymology being that which is limited to the single language to which it applies. There is nothing in any one of these instances which touches the question of the propriety of spelling *city* with a *c* on the ground of its representing the *c* in the foreign word *civitas*. Of the ground, however, to which it is limited, it covers a great deal.

Now the orthography of an allied language, the Irish, has not been reformed; and here we find an attempt to combine the etymological principle with the phonetic. The Welsh sacrifices the former to the latter, and *changes* the radical consonant. The Irish *preserves* it; but prefixes the letter, or its equivalent, (which in Welsh displaces it,) and gives us a rule by which it is said to be *eclipsed*; i.e., written, but treated in speaking, as if it were non-existent. Hence, the following table,

b	is eclipsed by	*m*, ar mbaile, *our town*, sounded *ar maile*
c		*g*, ar gceart, *our right*, sounded *ar geart*
d		*n*, ar ndia, *our God*, sounded *ar nia*
f		*bh*, ar bhfearran, *our land*, sounded, *ar bhearran*
g		*n*, ar ngearran, *our complaint*, sounded *ar nearran*
p		*b*, ar bpeín, *our punishment*, sounded *ar bein*
s		*t*, ar tslat, *our rod*, sounded *ar tlat*
t		*d*, ar dteine, *our fire*, sounded *ar deine*

Now, however meanly we may think of the value of the etymology which connects two words from different languages, like *city* and *civitas*; we must allow that, when we come to changes within the same languages, the etymological objection improves; and when we see such transformations in the radical parts of words as the pre-

cêding, we must admit that its validity, or, to say the least, its plausibility, may vary with the language. I am not writing this to show that in any language it is actually valid. I am only showing that different languages are in different predicaments in respect to its applicablility. And I only do this with the view of asking how the English stands in this respect. I submit that in respect to any of the above-mentioned languages, or as tested by any of the above-mentioned processes, it stands high. So far as the mixed character of its vocabulary goes, it is in a worse position. The phonetician condemns the etymological system *in toto*. It is well, however, that he should know how his own language, in the eyes of an opponent, and from his point of view, comports itself. The English is fitter for the application of the phonetic system than most languages; and, even when we weigh its demerits against its merits, as fit as any.

SECTION XXXVI.

ANALYSIS OF THE ETYMOLOGICAL PRINCIPLE.

The bearing of the instability of certain combinations, and certain points connected with the structure of numerous and important languages, has now received its full share of consideration; and, it is evident that upon the most important of the current objections to Phonetic Spelling—the Etymological—they have a very decided bearing. The number of scholars who hold that, though the phonetic system may suit some languages it is but ill-fitted for the English, is considerable. Now just so far as the English is a language in which there is a foreign element, this objection is plausible; and, as there *is* an inordinate proportion of foreign words in our tongue it has, to say the least, sufficient importance to command attention. Beyond this, there is but little in it. I have, perhaps, gone farther in this same etymology than usual; but I now wish to show that I have not gone farther than is necessary. Much that has been written, as the contents of the last four sections, has, perhaps, appeared irrevelant. But it is not this. The facts exhibited and the trains of reasoning suggested may, perhaps, have some import in themselves. But the main object of their exhibition is to show that they are only parts of a whole; only means to an end. However much they may, at the first view, appear to be something different, they are, in fact, preliminaries to the question as to the value of the etymological objection.

It will now be submitted to the reader that the ordinary objections which are involved in the word etymological, as it is generally applied, are mere fractions of the import of the term in its more general and more legitimate sense. The current objections are etymological so far as they hang loosely on the great subject of etymology; but as the representatives of etymology in its wider sense

they are mere chips in porridge. Nay, I will go farther than this; and add that they are objections which many an adept or master in the subject would hesitate to acknowledge. The distinction thus suggested, is of no small importance. There are two obstacles to Phonetic Reform which are of sufficient weight to counterbalance all the rest: and these are (1) the practical objection based upon the antagonism of an existing system; and (2) the theoretical, or scientific objection the name of which has already been often enough before us.

1. The first is so purely practical that the motto of its defenders might be, "Possession is nine parts of the law." There is an alphabet with its corresponding orthography that we are asked to either unlearn, or allow to fall into desuetude. This is a question of ejectment; a question with which the abstractions of the proposed system have less to do than the number and strength of the supporters of the principle, which they propose as a substitute. These will be considered; but not at present.

2. The Etymological Principle, on the other hand, is one which is only criticized for the sake of disarming, or neutralizing, a certain amount of opposition. Its upholders are more remarkable for their influence than their numbers. They are, as a rule, men who speak with authority; and it cannot be denied that some of them have spoken both plainly and decidedly. The man who knows neither Latin nor Greek may oppose any innovation on the simple grounds of conservatism: pleading his unwillingness either to learn a strange, or to unlearn a familiar, alphabet: and against such a one there is but little room for argument. The etymologist, on the other hand, urges that the alteration is a bad thing in itself: that, it violates one of the conditions under which the present system works advantageously. He may, or may not, object to what Mr Ellis calls the "Double-trouble" difficulty. And, just in the same way, the man to whom etymology is only known as a name, may invoke it so far as it suits his own supineness. But these are mere accidents in the determination of both of them. Each goes on a different principle; and each on one which is characterized by the class to which its supporters belong.

Now etymology is a very wide field, and it will not be denied that the most of those who have been the readiest with the etymological objection have cultivated but a very small corner of it. Whether they would speak in the same tone if they were familiar with the whole domain is doubtful. Those who are inclined to speak of the ordinary strictures of the movement in favor of Phonetics with respect, and even tenderness, cannot but admit that nine-tenths of the current criticism is of a very insignificant and common-place character. It is compatible, indeed, as we know from experience, with considerable acumen, respectable powers of argument, and accurate scholarship: but it is also found in company with mere dilettanteeism and sciolism;—sciolism and dilettanteeism in which a little

Latin and less Greek go a long way. Now it is the authority which rests upon such grounds as these that we wish to reduce to its proper dimensions: and that by showing that it is the result of that dangerous and two-edged tool—a little learning. Let us see what it is; and then ask what we find in Etymology in its wider and fuller sense.

It is not urged by even the most zealous etymologist (so-called) that any appreciable advantage is derived from the existing system for more than three languages; the French, the Greek, and the Latin—the three foreign languages which most affect the English vocabulary: and a little consideration will tell us that, essentially, these three are one—the Latin. It is *from* the Latin that we finally deduce the greater part of our French, and *through* the Latin that we deduce the greater part of our Greek words. In nine cases out of ten when, by some sacrifice of the representation of an English sound, we make the French origin of a word a *visible* fact, we are only half-way in our history; since it has to be traced from the French to the Latin. If the spelling of the characteristic letter remain as in *cité* from *civitas*, unaltered and visibly recognizable—well and good. If, as in *chaine* from *catena*, it undergoes a change—it is not so well. Hence, between the Latin and the French we get an imperfect representation in our etymology. "Only, however," it may be answered "in a slight degree. Though we change the representation of the sound from *ch* to *c*, we preserve the *c*; and the *c* is the great Latin characteristic; the very key to the connection, the outward and visible sign of the ancestry, the blazon of the pedigree. How much better this than spelling *chain* with a wholly new combination; such as *ch* in English, or by some new invention of a single sign!"

We get the same thing over again when, from the Latin, we trace a word upwards to the Greek. Sometimes the characteristic letter is retained; but, sometimes, it is changed. This is notably the case with words which in their older form are written with Greek κ (*Kappa*). These in Latin are written with *c*. In this case the etymological principle, certainly, suffers an abatement: in fact it ends in merely giving us the language from which the word was *directly* and *immediately* introduced: a fact worth taking as a gift, but scarcely worth buying at a price.

But even if we are prepared to pay for it, by making the connection between the sound and the sign by which it is expressed obscure, who gains by it? Certainly not the reader who knows neither French nor Latin, neither Latin nor Greek. To him the change is merely gratuitous, or, in the original meaning of the word, impertinent. To him who knows the particular language from which the word is derived it is, unless his ear is so deficient as to need the help of his eye, a superfluity. This is a point upon which we cannot too strongly insist. In order to get any real or supposed advantage out of any orthographical expedient in the way of etymology of this

kind, a certain amount of an etymological character is required: and, in most cases, the amount of this is such as to make the supplementary aids and helps unnecessary. It is not, perhaps, always the case; for there are, doubtless, some who have raised the voice in defence of what is to them a real necessity; some who actually want the little extra assistance which a piece of unphonetic spelling may, occasionally, drop on their way. I do not, however, find that they tell us so: and it is possible that many of them might not like to be accused of being personally interested in the matter. It is in behalf of others that they profess to fight the battle. The others, however, are, as a rule, neither the better nor the worse for their advocacy. Upon the whole, however, we may say that those who cry most for these aids to etymology least require them.

But when we get them, to the extent (at least) that we have them in English what do they amount to. We have seen, or rather we have tried to see, whom they benefit. But what are they in themselves? It is not pretended that they extend to more than three languages; and we have seen how inconsistently they present themsent themselves in these. With every language, where the alphabet is wholly different from ours, they are, of course, out of the question: and, all what are called the oriental languages are in this predicament. The one, among these, which is of most importance is the Arabic; because from this we get several words connected with chemistry and astronomy: and, besides these, a few, through Spanish or Portuguese of general meaning, e.g., *alcove*. Now, small as this latter class is, it is large enough to raise a question, and to introduce a distinction: for *alcovè*, on etymological principles should be spelt with a *c*: inasmuch as though Arabic in origin, it comes to us *via* Spain. But how are we to write *Alkali?* Speaking in the present year, we may, probably, say that the orthography is settled, and that *k* is the right letter. But we could not have said so at the beginning of the century; nor, indeed, for many years later: since *c* was then in favor. But even this will carry us no great way. What are we to do with the guttural variety of the letter? I cannot say. I only know that *alcohol* and *almanac* are perplexing words.

Surely then, we may say that the etymological objection, as we find it in the arguments of most of the objectors, is applied to, and based upon, a very small portion of the subject. Now the evidence upon this point is what the last four sections have prepared us for. They have been far more etymological in their character than they look. More than one of the limitations of the phonetic system has been thoroughly so,—for instance, the transformation of *avis* into *avir* in Monier Williams's illustration of the Sanskrit rule of *Sandhi*. The whole question of Unstable Combinations has the same character. They both deal with the changes that certain parts of certain words undergo, and what is this but a question of etymology, of history, and of descent; or, to put it in a more general form, of

the likeness or unlikeness with which different degrees of descent are accompanied?

Now, for readers who are wholly ignorant of any language but their own, the etymological system is useless; except so far as by degrading certain conventional modes of spelling (e.g., the *ch* in *archdeacon*, the *sch* in *schism* and a few others) to the rank of a prompter's cue, or a printer's catchword, and telling the reader that, whenever these combinations are found he may lay odds in favor of the word in which they occur being of Greek origin, we get a little rough information out of them: and this we now remark, is the characteristic of that particular form of etymology which deals with words belonging to more languages than one. The class is natural; as we see by the contrast it exhibits with its opposite in this very respect. Where the connection lies within the limits of a single language—that language being, of course his own—there is an etymology which an unlearned man may understand; for etymology here means the different forms which the same word may take according to its change of meaning. But it is just this kind of etymology that few care to defend. The connection between *ken* and *can* is left to take care of itself: whereas, that between *chain* and *catena* must be taken care of by its friends. There is inconsistency in this. But it is not wholly inexplicable. There is a difference between a common-place piece of knowledge and an accomplishment. There is a difference between useful work and dilettanteeism. There is a difference between the kitchen furniture and articles of *virtu*. There is a difference between the useful arts and the fine arts. Now it is with the fine arts and with the objects that interest the virtuoso that classical scholalship takes its place; and the class is a high one. It may be said, however, without offence, that in the fine arts there is more display than in the useful; and the same is the case with classical, as opposed to domestic, etymology.

This difference, then, between domestic and foreign etymology is, if not overlooked, at least undervalued. The former, which is of twice the importance of the latter, gets less than half the consideration. Domestic, however, is a term which with a little latitude we may conveniently extend to the languages of the German family in general,—the languages more especially allied to our own. Of these we may say that what applies to *ken* and *can*, applies to *can* and *kennen* (German) and *kjende* (Danish). But it is simply a waste of time and paper to show that, in the case of *c* and *k*, the precedents established by the Teutonic and Scandinavian languages in favor of the latter sign far outweigh those deducible from the Latin in support of the former.

Again, it has been already stated that when we go out of our way and divert orthography from its proper function of symbolizing a sound to that of suggesting an etymology; and when we flatter ourselves that, in so doing, we are preserving the history and registering the changes that such or such a word has undergone, we simply

deceive ourselves with a half truth. We preserve the likeness; but we conceal the difference: a preservation which, of course, gives us only half the real history of the word. The spelling which will give us the whole has yet to be discovered. This, however, is certain, that when we betake ourselves to a letter which has no value as the sign of an existing sound, for the sake of showing that the word in which it occurs has preserved enough of its former self to be recognizable, we use the alphabet for a secondary purpose; and, when we do this to the detriment of its proper functions; we misuse it. On the other hand, when we simply take a word as we find it, we have no need of any such detrimental makeshift. We have simply to spell a word as it is sounded. It may have gone through many, or it may have gone through few changes. It may not have been changed at all. At any rate, so long as we have nothing beyond its present pronunciation to express we have nothing to do but to put our alphabet to its proper use.

Now it is possible that, with the whole field of etymology before us, we might find good reasons not only for not upholding the ordinary etymological objection—the objection founded on the concealment of likeness—but for condemning it as one-sided and injurious; in which Phoneticism would be enlisted on the side of etymology. I cannot say to what extent this view will actually be taken; for, at present, it commands little attention. I am only sure of this; that those who take it will take from their knowledge rather than their ignorance; and that it will not be defended by arguments which can be contemptuously set aside. "I," says Caius, "condemn the proposed innovations because they would obliterate the connection between the different stages in the history of a word; and, by so doing, fail to give us those permanent characters which indicate its origin." And "I," says Titius, "condemn the existing system because, by concealing the full extent of the change that such words have undergone, it invests a combination with a show of permanence as a fact in language, which is wholly unreal." There are two aspects, then, for this part of the subject.

The bearing of the remarks upon the instability of combinations still stands over for explanation. They are closely connected with the etymological principle; and through this they lead to a question of some difficulty—that of the Fixation of a language. It is clear that if the tendencies, not only towards change but towards change in a certain direction, which were pointed out in the series *ka*, *kia*, *kya*; *ga*, *gia*, *gya*, etc., be true, and still more if they are capable of being generalized, we have something like the means of guessing with some approach to accuracy not only what a word *has* been, but what it *will* be; or, to use the words of a great scholar, we may say not only whence a word is come but whither it is going. There is, then, the etymology that simply reads the past history of words, and the etymology which constructs their future. In respect to the results of the two methods, there is not so much difference as we

may expect. The prospective etymology is more conjectural; but, with the present deficient record, there is plenty of conjecture in our retrospects. Neither is there much difference between the amount of acquired knowledge and mental aptitudes required for the respective studies of the prophet and the historian. It is possible that the prophetic may be the higher faculty. It is manifest, however, that the etymologist who looks in both directions is a better judge of what is good and bad in an alphabet in respect to its application or non-application to his subject, than the etymologist who sees only what lies behind him. I may do the objectors injustice; but the faculty of looking both towards the past and the future has not yet made itself conspicuous in their objections.

SECTION XXXVII.

REPRESENTATION AND FIXATION.

When the phonetic system is carried on to its ultimate results there is nothing to be said about such a thing as the Fixation of a language. Representation is the sole function of phoneticism. It is representative or nothing: and, when it is exclusively representative, fixation is simply a contradictory term. On the other hand, if representation mean, purely and simply, the reproduction to the eye of the sounds that fall upon the ear; and that without respect to the number or the influence of the speakers that utter them; and, also, without respect to their permanence, we can scarcely call this the representation of a *language*. Those who most love individuality well know that for a language to be worth spelling at all, it must possess *some* unity and *some* permanence. With fluctuating pronunciations it will have something to do: with transitional ones much. Ephemeral ones it will treat as such. Obsolete ones it knows how to deal with. With premature ones it has a difficult task. The general tendencies of a language will, sooner or later, get their own way. What comes from interference with them them is better shown than I can show it, in the following extract; which gives us the opinions of two critics. There is more in Dr Ingleby's notice than in Morgan's letter (for it is founded, partly, on one to the *Athenæum*); but I have the best authority for saying that, while it *represents* the opinion of the author of the notice, it does not *mis*-represent that of the subject. A premature stereotype of a transitional pronunciation has a re-action as well as an action; for it helps to fulfil its own accomplishment. It interferes with the natural tendencies of the language—in all cases, I believe, for a time only. But the interference, itself, is an interruption. It is not, however, an unmixed evil. It gives, as a set-off, a register of the change. This, however, is a sacrifice to etymology.

I think that, with this admission, the *pro's* and *con's* of this very perplexing case are fairly weighed against one another. The ex-

tract is from "Modern Logicians—The late Augustus de Morgan, by C. M. Ingleby, and it runs thus—

The practical had a charm for De Morgan. Many projects he viewed with favor, to which, however, he would give no support, because he regarded them as impracticable. The decimal system of coinage received his advocacy because he believed it was feasible, as well as theoretically good. To duodecimals, he gave no encouragement, because he believed that they could never be made to supersede decimals, notwithstanding his conviction that, if adopted, they would prove more convenient than the prevalent numerical system. Though strongly given to the archæological parts of literature, he was no blind opponent to the system of phonetic spelling, inaugurated by the *Phonetic News*. As a practical man he recognized but one objection, viz., the existence of the present system. His way of explaining himself was that on the theoretical side of the question there were no objections; if the thing could be got it should be got. He not only looked with favor on the scheme of *visible speech* put forth by Mr A. Melville Bell, but joined with Sir David Brewster and Mr Alex. J. Ellis in recommending its adoption. He was not imposed upon by the extremely shallow objection to any phonetic scheme, that its adoption would endanger the historical continuity of the language it is employed to represent. De Morgan saw plainly that the English language is undergoing a revolution of the worst kind; not so much from the introduction of vulgarisms, Americanisms, or neologisms, as from pedantic orthoepisms. Every child who is taught to read augments the prevailing tendency to pronounce strictly according to the spelling in vogue, *i.e.*, to introduce arbitrary sounds never heard before in any stage of development of the language. Such sounds are not determined by the laws of speech, but by a remote chain of causes, acting through the laws of combination of certain written symbols, and therefore not adapted for the purposes of speech. The only two courses by which this mischievous tendency can be arrested are these—to prevent children from learning to read; or to give them a phonetic literature.

Now in cases of this kind the Man for the Hour is the one who looks forwards as well as backwards. He cannot tell us, for the actual moment, which pronunciation prevails. But he can tell us which (if we *must* do anything in the way of fixation) is the one to choose. One gives us the language of, at least, some of our contemporaries, and, perhaps, some of our ancestors; the other gives us that of our posterity. Neither may be permanent. Which, however, will last the longest is self-evident.

SECTION XXXVIII.

THE EARLY ALPHABETS OF THE BRITISH ISLANDS.

Here begins a new division of our subject; one mainly historical. It treats of the conditions of time and place when the first alphabet of Latin origin was introduced into Western Europe. We must look for the country of its introduction in the west and north, rather than in the south and east; because, in the latter, the language or at least the literary one, was more or less Latin. This brings us to Germany and the British Isles. The oldest German alphabet (of which more will be said in the sequel) was *Greek:* but this applies only to the German of the continent. In the British Isles there

was a British Church, and this, whatever else it may have been, was earlier than the Anglo-Saxon.
